VARIETIES, Palace of, Middlesbrough, 618

Venice, the Pesaro palace, 433, 455

Venus, statue at Drapers' hall, 724

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

THE ENVIRONMENT OF BUILDINGS.

FOREIGNERS and colonial visitors who have helped to swell the crowd in the Metropolis during the late Jubilee festivities will carry back with them rather "mixed" and vivid impressions. Our buildings, streets, squares, and parks will no doubt have impressed them favourably, as seen under a veil of festal green and Venetian masts; but immediately outside the favoured streets many dismal rows of houses must have met their gaze. So much squalor and poverty, and so much gaiety and wealth, could hardly be matched anywhere else. More startling contrasts between the poor and the rich parts of the Metropolis could anywhere be equalled than those which present themselves to the visitor of the East and West. But there have been extenuating circumstances which have to a certain extent lessened the painful discrepancy between the wealthier and the poorer neighbourhoods. Sanitary progress and improved buildings have materially helped to soften down the disparities. Half a century has made a vast difference in this respect. When the century was in its teens the stranger might have gone from one end of the Metropolis to the other and have found a far more astounding difference between East and West than he would now. The change was greater, and more felt; there were no compensatory elements like baths and washhouses, public free libraries, hospitals and convalescent homes, technical institutes and museums, which now, through Governmental and private munificence, adorn the East-end as much as they do the West. The very presence of these buildings, often of architectural character, tends to soften the asperities of the locality, and to relieve the dull monotony of the streets. Narrow streets, passages, and courts, squalid and exhaling foul smells, have given place to wider thoroughfares and sanitary pavements. All these have been distinct gains to health and salubrity. Yet there is something more, which the foreign critic will find absent, and which sanitary improvements and building regulations have not supplied. He will miss the sense of art. What has been gained in material comfort is lost in qualities which appeal to the eye and the heart. The great model block of flats for the working classes has something forbidding and gloomy about it—a huge collection of tenements piled up one on another without character or variety; the paved new street of houses or tenements without breathing room at the back and perhaps close up to the street, is monotonous with its stereotyped house-fronts, as if the life and habits of the occupants were all cast in the same mould. The new streets are laid

out on straight lines to save every inch of ground, as if the first aim had been to squeeze in as many houses as possible for ground-rent. The great advertising mania so characteristic of the age cannot fail to arrest the eye of the foreigner wherever he goes. Our finest shop façades and offices covered with huge letters or posters—even chimney stacks and roofs utilised; our railway viaducts disfigured by placards. These and other modern things, like overhead wires, impart a commercial stamp to our streets and buildings. There is something in all these modern appliances which weary and disappoint the observer. They disgust the artist, not because they are useful and necessary, but because they shock the taste and are put up without any regard to architecture and the sense of propriety, right across façades, spoiling some feature with lines of wires, as a chimney or a roof. They are offensive against good taste, and all sense of proportion is lost between the utilitarian and the artistic. Can anything be more incongruous than the proximity of gasworks and ugly gas-holders to a neighbourhood of houses, anything more deplorable than the juxtaposition of prodigious blocks of dwellings with low buildings, or hideous railway structures spoiling the best approaches to a suburban, such as we see everywhere in London. No wonder all our best architecture is spoilt by utilitarian structures which are allowed to thrust themselves into notice.

The West-end is no less full of these monstrosities than the East-end. Knightsbridge itself has been spoiled by the erection of monster blocks of mansions and barracks, and the vicinity of the Imperial Institute and Kensington Gore is ruined by the erection of blocks of considerable height and of intensely ugly profiles. A few years ago this site—the Royal Horticultural Gardens—rendered famous for its series of now historic exhibitions, beginning with the "Fisheries," and ending with the "Colonial," was a charming open spot in the midst of palatial street residences, covered with grass, and adorned by valuable trees and shrubs: now it is a wilderness of bricks and mortar between the Natural History Museum and the Albert Hall. Even the Imperial Institute, both in front and rear, has been spoiled by the nearness of unsightly brick buildings. Here we had an exceptionally fine position marked out by two important buildings, one in Kensington Gore, and the other in Cromwell-road, close to Hyde Park and the South Kensington Museum, bounded on the west by Queen's Gate, and on the east by Exhibition-road. In a few years the site is so hemmed in by lofty buildings which have been

planned without any reference to the general surroundings, that the visitor will look in vain for any of that skill in artistic disposition of great edifices which marks the plans of most Continental cities. What have we to compare, for instance, to the Arc de Triomphe, or Place de la Concorde, Paris, or that of the République, with their wide roadways and pavements, statuary and adornments, or lines of trees? Paris, with its labyrinth of dark, Mediæval streets has been transformed into broad, spacious thoroughfares adorned by architectural and sculptural features and planting. The "Commission des Artistes" was appointed after the Revolution of 1848, and the work of remodelling Paris has proceeded ever since. New streets were driven through densely-populated districts; but these have been undertaken and finished according to the plan of the commission made fifty years ago. The Loi d'Alignement gave the municipal authorities power to create a servitude on land bordering on public thoroughfares, or those in advance of the line of frontage laid down. By this means the erection of new buildings has been made to fall into line, and the rectification of the lines of old streets has been brought about. Our course is different. Plans are proposed and set aside, or a remodelling is begun, to be curtailed at the next election of the local authority; so we get a piecemeal arrangement, worse in some cases than the previous state. Mr. Hamerton writes, in his "Old and Modern Paris": "An Englishman who finds himself in some great Parisian street of our own time, such as the Boulevard Haussmann or Boulevard Malesherbes, has nothing to do but confess that here indeed is the ideal street, and that his own Shaftesbury-avenue, Bond-street, or Oxford-street are not yet the ideal." And he points out that a street ought to be of the same width throughout, with seats for foot passengers on the causeway. Look at the boulevards, for example, which converge on the Arc de Triomphe, twelve altogether, some of them 300ft. wide and over 1,000 yards in length, with clear views of a mile in length.

Again, Vienna has been remodelled on similar lines; a wide boulevard or "ring" has been formed round the city, in which many stately open spaces have been planted, like the Ring Strasse, and this surrounding thoroughfare is connected to the broad quay of the Danube Canal. We could give other examples. It is not unlikely that our visitors will compare mentally these and our own shortcomings, the random piecemeal arrangements of our streets and main centres of traffic with such a great focus of thoroughfares as that of the Arc de Triomphe, our squares with that of the Place de la Concorde.

Such a centre as that of Oxford-circus or Piccadilly-circus will raise expectations; the eye looks for some order, symmetry, and design, and finds none. Natural features or statuary are absent altogether, and there are few seats for weary pedestrians, while the examples of fountains and statues we possess may well create in the minds of our visitors "odious comparisons." Where nature or art could have been utilised or turned to account, the commercial speculator seems to have had all his own way.

Two important principles have been lost sight of in the remodelling of the Metropolis. One is the isolation or emphasis of our great buildings. The authorities of the French capital take care to isolate their chief edifices, their churches and palaces, making them the attractive features, as anyone may see who looks at a map of the city. Except in the two cases of churches in the Strand, which are isolated, the rule seems to be to block out our finest buildings, exposing them only on one or two sides. We thus lose them as great features. Is not the Law Courts spoiled by being practically shut in on two sides, and the Government Offices in Whitehall similarly cramped, being only visible in front and rear? Imagine what these buildings might have been—better architecturally, and certainly more imposing—if they were placed in areas of ground clear all round, and made the centres and main thoroughfares east and west, north and south! Wren proposed such a scheme in his plan of making St. Paul's Cathedral a great centre with radiating streets, while we all know how it is situated. Our foreign visitors, who took part in the imposing function before the west front of the cathedral the other day must have been disappointed at the contracted area in front of our great City basilica, and how little of the proportions of Wren's noble fane could be seen from the adjacent side street. The great City centre at the end of Cheapside is another instance of partial isolation. The Royal Exchange is at least a stately structure, which faces the spectator as he proceeds eastwards and divides two main arteries of traffic. Here we have an instance of an isolated building. The Bank is also surrounded by streets; but the whole area might have been made imposing if these edifices had been placed symmetrically in a great square, by which the wedge-shape of the Exchange might have been avoided. If Fleet-street had been in a line with Cheapside, what a grand effect St. Paul's and these buildings might have produced! The second principle is the importance of natural features in the environment of our great buildings. How few of our parks and gardens are made to border our thoroughfares or to play a part in their design. Green Park certainly skirts Piccadilly from Hyde Park Corner for some distance, and Hyde Park is partially bordered by two thoroughfares, Knightsbridge and Uxbridge-road; but how little they are made to contribute to the effect! A row of old houses and a large block of cavalry barracks shut off the view of the park from the former. The scene-painter idea emulated by our French neighbours would have probably suggested Hyde Park as a noble part of the thoroughfares on either side of it; the fine trees, and the Serpentine itself would have been brought into the vista, just as the Parisians have opened up their town parks, like the Parc Monceaux, or the Champs Elysées, by boulevards, which pass through their most beautiful parts. Our greatest modern thoroughfare is the Thames Embankment, where the reclaimed land of the old wharves, now a fringe of gardens from Westminster to Waterloo Bridge, borders the road and combines with the river itself in giving dignity to the roadway. Some of our most successful modern buildings have been erected along the river from Westminster to Blackfriars,

though there are no evidences of any attempt to unite the architecture with the roadway or its scenery. Even at the bridges the arrangement of buildings at the approaches has been left to chance. The most diversified character and irregular skyline prevails. What might have been is almost a vain regret in an age of commercial expediency, with frontages and building areas of fabulous value. Still, something can be done if we had the mind and heart to do it. We have still men like Perrault, Vanbrugh, and Uvedale Price who can conceive schemes in which scenery and architecture can be united; but our municipal authorities lack the courage, and content themselves with piecemeal improvements in which ground landlords, lessors, and surveyors are most concerned.

ROUGH AND RAPID BUILDING.

A CASE tried in the Newcastle-on-Tyne County Court ought to convince people of the great risks incurred in rapid building. The widow of a working man sued a builder on behalf of herself and children for damages sustained through the death of her husband, who died from the collapse of a house at Sandgate, Newcastle, in March last. The jury had to inquire into the cause of the fall. The defendant was both the owner and builder, engaged in pulling down when the accident occurred, which resulted in the death of Brogden and four other men, and injury to others. As we reported the case, it is needless to explain all the circumstances. The plans deposited by the builder with the corporation did not disclose the whole of the work contemplated, and notice of intention to commence the work was not given, as it should have been. It was contended that if the officials of the corporation had had the opportunity of seeing the work as it was being carried out, the workmen engaged would have had the benefit of their supervision, and their lives might have been saved. Great hurry was used in taking the building down, and a number of men were employed. Were reasonable precautions taken? The evidence given showed that the house was in a very dilapidated state, the mortar had lost all its properties of adhesiveness, the timber was rotten, there were no ties or bands, and yet in this condition a chimney-breast was removed, and the back wall cut into and a girder inserted, while the shores were taken out too soon. Other evidence was to the contrary effect, but verdict was returned for plaintiff—damages £225.

This is another instance where the desire to expedite the work has resulted in a catastrophe. It has lessons of deep import to all owners and builders who are engaged in altering and pulling down old buildings. There is the desire to "rush" the work, and, as in this case, more hands are engaged than is either necessary or desirable. Pulling down old walls of doubtful brickwork is not a work that should be done without consideration and judgment. Every part that looks weak or uncertain in its support ought to be shored, and no essential part of a structure like that of a chimney breast should be taken down till the last thing, and not before the building has been securely shored up. From what we can gather from the fragmentary evidence given, the building was poorly built, the mortar had lost its nature, and the timber ties were brittle; careful inspection of the ties or bond were not made, and the walls were not sufficient to carry any weight. Notwithstanding which, the old walls were cut into, and a girder inserted, and the support of a chimney-breast removed without proper temporary supports. A number of men had been employed—about 19—their combined work and action tending to shake the loose

and incoherent walls. The shores were taken away before the girder and joists were fixed or the mortar had set. The girder was put in an old and not sound wall instead of being carried by brick piers. All this is typical of a good many alterations of old buildings. No examination is made of the old walls and their nature and bond, whether the mortar is rotten, if the chimney-jambes are properly bonded to the party-wall, or whether it is safe to cut into a wall to rest a girder on. The work has to be done quickly, and there is a penalty for non-completion by a certain time. In many town buildings that have to be altered, other inducements to hurry the work are apparent. The builder is required by the by-laws to give 48 hours' notice to the authorities, as in the case we have mentioned, before the work is actually commenced, which notice enables the officials of the council to make an inspection, and supervise the work as it proceeds. An artful builder tries to get over this official inspection by commencing his work as soon as possible after the plans are passed. The sooner he begins to pull down or commence the new building, the better it is for him. He naturally does not desire the work to be examined. We have seen premises hoarded round and pulled down in an exceedingly short space of time. In these operations the architect takes not much interest as a rule, his principal care is with the new work, and he is often contented to leave the pulling down and shoring to the contractor. Yet there is often more skill necessary in dealing with the old work, in directing where shores are to be placed, what walls are to be taken down, and in supervising the cutting of openings and the insertion of beams.

There are certain legal points in the case. One of them is, Whether it is possible to use reasonable care if the work is done in a hurry, as when overtime is made? As the judge said, the question for the jury was, Did the "defendant do what a reasonable man would have done under the circumstances"? The liability of the builder in the case of accident is a serious one that ought to make contractors more than ordinarily careful in their work. Building workmen are very apt to dispense with the usual supports like shores as soon as possible. They impede their operations, and they are not sufficiently conversant with structural matters. If they can save their labour in any operation like cutting away a foundation or any piece of masonry, they seldom think of the consequences that might ensue. They are prone to take advantage of the natural cohesiveness of the materials they work in, quite unmindful of the effect of thrust or the imperfect bond and bad mortar of the wall. Rough and rapid building can only be practised at the great risk and responsibility of the builder. Hurried building is generally a blind to cover rough workmanship, and it is one of the subterfuges resorted to by a certain class of contractors which calls for the architect's closest attention.

The district surveyor knows how alert he has to be when Mr. Scamper is putting up a row of houses—how quick he has to be in preventing a lot of old mortar being sifted for lime, or a lot of loam and unclean sand being used in the mortar. He has to be pretty quick, too, if he wishes to condemn cartloads of inferior bricks, or to see that the walls are not built with bats. Commercial enterprise has encouraged rapid building. A large bank or insurance office, a shop or a restaurant, must be rapidly finished for business, and the contractor knows too well how he can turn this circumstance to his personal advantage. In all contracts the quicker the building or other work is completed the better, and this hurry in execution leads to many of the evils we have been considering, and roughness of execution and risk are two of the most important.

FOUR SOMERSETSHIRE PULPITS.

SOMERSETSHIRE PULPITS.

THE accompanying measured drawings of pulpits are taken from four villages lying within a couple of miles radius of Weston-super-Mare, and exhibit the characteristic Perpendicular work for which the county of Somerset is so justly famed. These at Kewstoke, Hutton, and Locking are octagonal, that at Worle being hexagonal.

E. G. RODWAY.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE sixteenth general meeting of the Institute was held on Monday night, when the Gold Medal was presented by the President to Dr. Cuypers, H.C.M. The attendance was large.

The President, in his opening address, after some general remarks about the works of Nature, the Pyramids, the Acropolis, &c., said: "I have now to introduce to you the distinguished Dutch architect, Dr. Cuypers, on whom you are about to bestow the Gold Medal. It is usual to give a slight sketch of the life and works of the Gold Medallist, in the interest of those who cannot be here; and many of those who would be here to-night are in the uppermost parts of the earth. So I must ask Dr. Cuypers to bear with me a little longer. I can hardly think of Holland as a foreign country, so intimate has been the relation between it and England, so warm is still our sympathy with its soul-stirring efforts in the cause of freedom; and did not Holland give us one of our revered kings, William of Orange, and many of our celebrated families? Most of us when at school translated Grotius and the dialogues of Erasmus, that friend of Sir Thomas More, whom he called "his darling." Who does not love the Dutch school of painting, and feel at home with its creations? Who has not been enchanted by the power of Rembrandt and the vigour of Frank Hals, with the crystal purity of the colour of Peter de Hooze, with the woods of Hobbema, the rushing waters of Ruys-

dael, and the beautiful architectural works of Van der Heyden? Who has not been fascinated by the dignity of those warriors and statesmen, and by the grace and loveliness of those high-born ladies that live for us again in the pencil of Van Dyck? Who has not in imagination shared in the hardships and rejoicings of such discoverers as Van Diemen and Tasman? Dr. Cuypers finishes a long line of distinguished Dutch architects to whom we owe the admired Mediæval churches, mansions, and town halls, and the wondrous cathedral of Antwerp, through Renaissance days when Van Santen, under the Italian name of Vasanzio, designed the Villa Borghese and the portal of the Vatican for Pope Paul V., when Floris, Philip Vingboons, Van Campen, and Post enriched their native country with their works, all of which have been preserved for us in the publication of Mr. Ysedyck. It is not usual to give the age of our Gold Medallist; but on this occasion the arrival of Dr. Cuypers' seventieth birthday this year has been the cause of almost national rejoicings in Holland; this points to something in his personality and career that has touched the hearts of his compatriots in a way that no mere quantity or excellence of his works could insure. Dr. Petrus Josephus Hubertus Cuypers was born on May 16, 1827, at Roermond. In his nineteenth year he became a student at the Antwerp Academy, and got the prize for excellence, and the gold medal for architecture in 1849. He began his practical career by the restoration of the Minster of Our Lady in his native town, and built his first church in 1853. In 1864 he was awarded a crown for the William I. Museum, and up to 1894 he had built a cathedral and sixty-one churches and chapels in various parts of Holland and Belgium; he had restored 57 ecclesiastical buildings, mostly cathedrals and churches, and built museums, railway stations, mansions, villas, and private houses, besides his great work of the Royal Museum at Amsterdam, some 45ft. long and 280ft. deep, with a central hall some 70ft. wide and 260ft. long; the whole building com-

prising two quadrangles 130ft. long and 100ft. wide; it is built of brick, with stone window-jambes and mullions and bands. The style adopted is Late Gothic, just feeling the first breath of the Renaissance, in which cusps have been abandoned. This, however, is by no means all we have to be thankful for, as he started schools all over Holland, where the innumerable handicraftsmen who carry out architecture were taught the elements of design belonging to their craft. His motto is, 'I believe, I love, I hope,' and he says, 'The love which binds together my beliefs and my hopes makes up my life.' In his own house he has inscribed an apothegm of architectural wisdom: 'Study the old, in order to win strength and support to design the new.' It is clear that any architect who had carried out such an enormous mass of work must have been guided by fixed principles systematically employed; and when no detail has been allowed to pass without his own supervision, and is mostly from his own hand, it is obvious that his industry must be equal to his genius. Sir, you are said by your contemporaries to be the one man in Holland who has done more than any other to point the way to higher things, and to follow out his own teaching. I gather from the admiration you excite in Holland that your character is as much revered and loved as your genius is admired, for without the existence of peculiarly admirable qualities we cannot believe that you would have so endeared yourself to your countrymen, for you have falsified the poet's saying that—

He who surpasses or subdues mankind,
Must look down on the hate of those below.

I now beg, in the name of the Royal Institute of British Architects, to invest you with Her Majesty the Queen's Gold Medal, and to enrol you amongst that company of Gold Medallists that sheds such lustre on our Institute and on our country, and to hope, both on behalf of the Institute and myself, that you may live long to enjoy the honours you have so well merited, and the love that you have called forth, and to add to the number of those works with which you have already so largely adorned your native land."

Dr. Cuypers read his reply in French. The following is a translation:—"Mr. President,—Allow me to express myself in another language than in your national tongue, which I deeply appreciate and revere, but would fear to profane by speaking imperfectly before this august assembly. My own Dutch speech, although it partly has a common base with yours, in that old Saxon which had it not been for Charlemagne, would have become the universal Germanic or Teutonic language, is familiar to only a minority of the inhabitants of Great Britain, and would not suffice to render me intelligible in this chamber. I have recourse to the French language, which has numerous relations with yours—witness the denominations of the provinces of Normandy and Brittany in France—and like English, but in a less degree, is heard in the most distant countries of the terrestrial globe, everywhere that civilisation and liberty have established their glorious reign. I feel, Mr. President, that I must, before and above all, express to you my sincere thanks for the words, too kindly and too flattering, which you have been good enough to address to me. If it is true that all approbation of our work flatters our pride, what satisfaction must we not feel when this approbation comes from those of our colleagues for whom we have reserved a place of honour in our esteem and our veneration. Yes, at this hour I dare publicly and solemnly say that, if I have had any success in my career as an architect, the example which has been given me by my colleagues in Great Britain has greatly contributed to it. When I visited England for the first time, so as to study the great monuments of our neighbours, it was not only the ancient and majestic cathedrals, the characteristic churches of little towns and villages, the splendid colleges, and other monuments of bygone ages, which delighted and deeply impressed me, but, above all things, the wise lessons which my honoured colleagues Pugin, Scott, Street, Burges, Clutton, and so many others—only to speak of those who have gone before us into eternity—had drawn from the work of the great architects of the Middle Ages and of antiquity. It was here that I saw applied, with that correct, sober taste which characterises your glorious nation, the pure, true, and unchangeable principles of our art, which must be true, utilitarian, and practical, and at the same time not offend against those elusive canons of Beauty wherewith God has endowed us, to be the

immutable appanage of those who cultivate the arts. It was particularly in your country, my dear colleagues, that I learned to estimate at its just value the charm which proceeds from correct and persevering application of the difference between materials, as much with respect to their properties, nature, and qualities, as with respect to their colour and other aesthetic features. It was here that I learned to appreciate the great advantages that result from the survival of the old co-operative guilds of arts and crafts, by which you have been able to maintain for the execution of your works practical and capable craftsmen, worthy of the share in the work that is entrusted to them. It was in your country more than anywhere else that I noted and admired the happy application of the good principles of the past to the needs of modern society in all the works of your great masters. If, on the one hand, your fair and interesting land attracted me, with its rich monuments and its great analytical architecture, on the other the welcome given me by my dear colleagues, from my very first visit, was such that I was able to profit by all the advantages that friendship and urbanity can offer. If the old masters were there to instruct me and to stimulate my ambition by the contemplation and the study of the masterpieces of great periods, the living masters, their worthy rivals, gave me their aid in procuring me access to, and serving as my guides in, all hidden nooks of interest, in all celebrated museums, in the innermost of all sanctuaries of art. It was in 1866 that I had the honour of being elected Honorary Corresponding Member of the Royal Institute of British Architects—a title which is held in high esteem abroad, and in itself gives a certain influence and position to any architect. And who will be astonished if it is known that this noble Royal Institute is the great school in which has been, and is still being, formed all that England can produce of that which is glorious and illustrious in architecture? The preservation and the restoration of the historic monuments of your ancestors, the imitation of ancient models, the assimilation therewith of new buildings, the formation of a legion of artists fighting, without ever losing ground, against those errors of every kind with which the depraved taste of certain periods threatened the sanctuary of art—these are the first-fruits of this glorious institution. Another great service rendered by you to the whole artistic world is to be found in the important travels that you have undertaken so as to study the monuments of the most distant countries, without regard to the manifold sacrifices that such enterprises inevitably entail. The remarkable publications in which are printed the results of these artistic peregrinations are, and will remain, a splendid memorial of your Royal Institute. If on this day I have thought it behoved me to pay homage to the Institute for the great services which it has rendered to the artistic world in general, I will beg you to believe me, my honoured colleagues, when I add that I feel doubly happy in being able to express to you my keen appreciation of the distinguished honour with which you have gratified me. I venture to request the honourable President to be kind enough to act as interpreter for his foreign colleague before Her Majesty the Queen of England, in order to express to her my deep gratitude for the fact that she has deigned to confirm the choice of the Institute by honouring me with the Gold Medal in the very year when so many millions of faithful subjects are blessing Heaven for having given them as a Sovereign the most accomplished woman who has ever worn a crown."

Photographs of Dr. Cuypers' chief buildings were shown on the walls, and portfolios of his drawings were exhibited on the table.

THE LONDON COUNTY COUNCIL AND THE WORKS DEPARTMENT.

At the meeting of the London County Council on Monday, discussion was resumed on the report of the Special Committee on the Works Department. The committee recommended: "That a Works Board be substituted for the Works Committee, such board to be elected forthwith, one member to be nominated by and from each of the following committees: Finance, Asylums, Bridges, Fire Brigade, Highways, Improvements, Main Drainage, Parks, and Housing of the Working Classes; and that in future years the election of members of the Board do take place at the meeting of these committees next to the 31st March."

In the absence of Lord Onslow, Mr. Porter moved, "That, as the Council is divided in opinion on the question as to the permanent maintenance of the Works Department, it is inexpedient to discuss the question of substituting a Works Board for the Works Committee; and that it be referred to the General Purposes Committee to consider and report, in conjunction with the principal officers concerned, on the steps which should be taken with a view to carrying on the business of the Works Department with as little loss as possible to the ratepayers until after the election of the new Council." He declared that he was animated by no opposition to the Works Department. The question was, Should the Works Department be rehabilitated and put upon a permanent basis in the form of a Works Board controlling? Next March there must be a new Council, and the wisest course was to preserve the thing as it stood at present until the electors had an opportunity of pronouncing judgment. He had no confidence in mere change of name from that of a "Works Committee" to a "Works Board." They were not justified in putting an end to the Department, nor were they justified in putting the Department on a permanent basis for the same reason. The course recommended by the amendment was a prudent course under the circumstances.

Mr. Campbell seconded the amendment, and contended that the labour policy of the Council was a mistake.

Sir A. Arnold said he had not abandoned hope that there might be some basis of agreement. The Works Committee was just as much divided against itself as it was when eminent members of it gave evidence before the Special Committee. It was necessary that the matter should be dealt with at once. He himself would be willing to accept the amendment to be moved by Mr. White. He made the proposal because he felt the Department would not work with any success unless there were a united council. He hoped that Mr. Porter's amendment would be withdrawn.

Sir J. Blundell Maple said the Moderate party had done their best to make the Works Department a success, but it would not pay.

After further discussion, the amendment was lost.

Mr. E. White moved as a further amendment, "That all works ordered by the Council to be carried out without the intervention of a contractor shall in future be carried out by the manager of the Works Department, who shall be responsible to the Spending Committee in the same way that a contractor would be; and that the Finance Committee shall have control of the finances of the Department." He contended that the Moderates had striven to the best of their powers for the success of the Works Department, but they had been treated with hostility by the Labour members. They were trying to put the Committee on a sound footing. The work should be put in the hands of a man who knew something about the intricacies of the contractor's business.

The amendment was seconded by Mr. Antrobus, and carried, after a lengthy discussion.

The other recommendations of the Committee were adopted, with amendments, consequent upon the adoption of Mr. White's amendment.

ERECTING BALTIMORE COURT HOUSE.*

THE Baltimore Court-house is a large, tall, steel and stone building 313ft. by 191ft. in extreme dimensions, that occupies an entire square between Lexington and Washington and Liberty and Calvert streets, Baltimore, Md. Its construction involved such a large amount of high and heavy hoisting and rapid handling of beams and columns, masonry and materials, and the magnitude and duration of the work were such that the contract prices and requirements justified the design, manufacture, and installation of a special power and hoisting plant and a system of work and apparatus adapted to the long and important service for the entire continuous construction of the building entire. The complete erection was awarded in a single contract. These conditions justified an unusual expenditure for plant, and it was determined to provide derricks that should command every part of the building and handle any amount of material, including the heaviest possible loads, at a rapid speed and each

unit independently of any other while operated from a single central power station on the site.

It was decided to adopt a system of long-boom derricks of adjustable heights, operated by independent special hoisting engines coupled on to line shafts driven by two engines on opposite sides of the building that received steam from a single battery of boilers. Competitive designs for the details and arrangement of such apparatus were received and the system shown herewith was accepted from a number presented that included several alternate arrangements and modifications from the successful bidders. The result of the study and comparison of methods was the adoption and development of a series of six tall, square towers, 16ft. by 16ft. by 170ft. high, set near the corners and in the middle of the long sides of a rectangle 100ft. by 250ft. concentric with, parallel and similar to the building lines. Each tower had two trussed booms from 60ft. to 70ft. long that overhang the curb so as to unload waggons in the street at twelve different places at once if necessary, and transfer their burdens from one to another or deposit them at any given points within the building walls. All these derricks are raised and lowered, hoisted and swung by one operator on an elevated platform in each tower, who controls the engines on the ground below by hand levers and pedals. This system, therefore, provides for the simultaneous hoisting and transfer over any part of an area 250ft. by 360ft. of twelve separate loads (aggregating 80,000lb.) at a speed of over 50ft. a minute by a force of 15 men, allowing two men on each tower platform and two on the ground to attend the engines, besides one fireman. One man can, however, frequently operate both booms in the same tower.

Fig. 1 is a plan showing the outlines of the lot and building, the location of the towers, &c., the position of the central power plant, location of driving-engines E E, alignment of shafts, and the system of adjustable steel wire cable guys G G, &c., by which the tops of the towers were secured and strains distributed from one to another and transmitted both through their braced sides into the ground and through the four 1in. main corner guys C C, &c., to heavy oak piles driven 15ft. deep into the ground.

Fig. 2 is an elevation of part of the lower portion of one of the towers. These towers were built in two sections, the first ones being about 70ft. high above the surface of the ground, and having the booms connected at an elevation of about 30ft., as shown, where it was operated to set all the material up to the third story, after which the tower was extended 70ft. higher and the boom raised 40ft., and used to complete the hoisting for the upper stories.

The towers were 16ft. square, with 12in. by 12in. corner posts, in 20ft. lengths butt and cover spliced, with 1½in. bolts in each splice. There were 3in. by 10in. horizontal and diagonal braces, spiked on every side. The towers were each set in a pit 18ft. deep and loaded with about 40 tons of ballast on a bottom platform to increase their stability.

Fig. 3 is a general plan of the building showing the positions of the columns which were set by the booms. Immense walls were built inclosing the columns and all around between the n, which are here indicated in general outline.

Fig. 4 shows the trimmings and details of connection at A at the foot of the boom.

Fig. 5 shows the construction of the horizontal wheel W, by which the mast and boom were swung by means of rope R, Fig. 2.

Fig. 6 is a plan and elevation of the operating platform and levers in the tower from which the hoisting engines are controlled.

Fig. 7 shows the general features and dimensions of the pair of special hoisting engines at each tower. The line shaft S runs continuously and always drives the main gears H H, and secondary shafts I I, that, however, run loose except when engaged by clutches K K, that throw the drums in and make them wind up when moved by the rocker levers F F, and their vertical rods R R, shown in Fig. 2. Pawls P are arranged to stop the drum in case of breakage and the rocker lever F automatically sets the friction brake as fast as it releases the clutch. Drums D2 and D3 operate the hoist and topping lines respectively. Belts L L continuously drive end shafts M M, upon which paper cones, A A, are set, so that when either of them engages coned disc wheel, C, the other has a clearance of ½in. (not here shown). Pulling rod N (Fig. 2 also) makes the rocker R turn the pinion P through part of a revolution in one direction, and

* From the Engineering Record.

ERECTING THE BALTIMORE COUNTY COURT HOUSE.

DE LA VERGNE MACHINE COMPANY, New York City, Designers; Messrs. JOHN GILL AND SONS and D. W. THOMAS, Baltimore, Md., Contractors.

it, engaging the rack attached to shaft M, brings wheel B into contact with disc C, and through it and a worm gear drives D1, so as to swing the boom to the right; pulling rod, O, similarly engages C and A, and operates the drum D1 in the reverse direction, so as to swing the boom to the left; if neither rod N or O is pulled and held, drum D1 will not be driven at all.

All the derricks are operated by the two 50H.P. high speed centre crank steam engines with auto-

matic cut-off and a speed of 275 revolutions per minute. This speed gives a speed of hoisting for each boom of 72ft. or 120ft. per minute, according to whether a five-part or three-part tackle is used. Allowing a loss of 25 per cent. for overcoming friction, &c., it was calculated that both engines could lift 18 tons 72ft. high in one minute when making 275 revolutions, and single loads of from one to three tons could be lifted by three and five-part tackle at the above speeds. At 2.5

revolutions of the main engine, 10½ tons could be lifted 52ft. or 87ft. per minute, at 200 revolutions. In practice it was found that one boom on each tower hoisted 6½ tons 52ft. high per minute with ease.

This plant was manufactured and installed for the contractors, John Gill and Sons and D. W. Thomas, Baltimore, Md., by the De la Vergne Machine Company, New York, and to their engineer, Mr. Gus P. Wern, who designed the

hoisting machinery and details of the plant, as well as to Messrs. John Gill and Sons, we are indebted for the data from which this description has been prepared.

Fig. 8 is a view of the mechanism at the foot of the masts to revolve them horizontally.

"BUILDING NEWS" DESIGNING CLUB.

A GROUP OF STABLE BUILDINGS.

"NUT" is placed first, and "Pickles" comes second; the third position is obtained by "Nap." All three designs are picturesque and interesting. The condition issued to the competitors were as follows:—"A group of stable buildings suitable for erection in connection with a gentleman's moderately-sized country house. The accommodation to comprise six stalls and two loose boxes (the latter may be located in an adjacent building to the stall stable), a washing place, harness-room, and a coachhouse for four vehicles. A groom's bedroom must be provided on the first floor, and a loft for provender. A corn-shoot desirable. The carriage-washing space to be outside in front of the coachhouse. Adjoining, and planned to group well with the stables, a cow-byre for five cows is to be provided, with a covered yard, a mixing-room, and a calf-box large enough to be divided into two. A small dairy and churn-room may form part of the buildings, and a hen-house; two earth-closets, one for use near the dairy. Scale 8ft. to inch for elevations. Plans may be smaller. Two elevations, one section, and plans with view. Materials, brick and tiles." "Nut" sends a pretty sheet of drawings illustrating an unpretentious group of buildings which would look at home by the country-side almost anywhere, and his plan has several advantages, one of which is its compactness, and another is its suitability. The arrangements readily explain themselves, and although in items of detail we are aware that modifications may be pointed out as desirable, "Nut" well deserves the first place. The turret shown in the front elevation is left out in the view, an omission with which we agree rather, though it is not fair to do so while the turret is left in on the elevation, where it does not look badly. As a matter of fact, it would come better on the ridge if shifted to where the gable of the loft runs back into the main roof. The adjoining chimney is pimplingly small. Our old Mediæval builders realised the value of a long unbroken ridge line, and if it curved about a bit so much the better; but when they did put a chimney there was no mistake about its importance and scale. "Pickles" makes more of his stable-yard, but we do not like his design so well, and in a way it is not so pleasingly unambitious as "Nut's." The arch, in a skimpingly thin, rough-cast plastered wall, is not a happy one, and the reveals being so shallow, the effect would be poor and thin, and thereby this objection is increased. In old English stuccoed and whitewashed cottages the walls were mostly built of local rubble, used necessarily very substantially, and thus the charm of simplicity and solid breadth insured their distinguishing characteristics. In modern every-day building we are well aware how difficult it is to obtain a kindred spirit, like that associated with ancient vernacular work; but, of course, archaeology is not architecture—a mistake often made by those who affect a crude queeriness. Successful contemporary work becomes so when the requirements and conveniences of present-day conditions are suitably recognised and artistically provided for, a truism which seemingly needs constant reassertion, judging by the major portion of the designs nowadays erected. "Nap," the author of the third design, has merits which we have not overlooked, and although he has provided a more adequate dung-pit than "Pickles," he has located it in a needlessly confined position, convenient enough in some respects, but not a nice arrangement at the end of the covered yard. The roof over this covered yard seems to go the wrong way, and if a longitudinal section of it with the adjoining slopes were shown, our point of objection would look very conspicuous. The cross-section given is really rather misleading. One of the best designs submitted is by "Dache." Architecturally, it is very nice indeed; but its author loses marks by ignoring our rules about the size of the paper, by making his drawing much too large. "Pantile" sends a group of farm buildings of no little merit; one advantage of his over "Nap"

is that the dairy can be better visited by the lady of the house and her friends. The perspective is nicely drawn, and the whole composition is done without ostentation. The balance of plan has been allowed to govern the arrangements too clearly, and the large yard to the stables is wasteful without being roomy, the solidly built washing space with its big arches obtruding too much and incurring a needless expense. There is no dungpit and no place for one. The maids' E.C. is too much in evidence from the stables. "Tyke" errs, too, in this respect, for though the E.C.'s entrances are well isolated one from the other, the author has placed them back to back in such a way that they could not be used as earth closets at all, and another objection is that the dairymaid's closet entrance would very likely be mistaken for the way into the dairy, a very awkward oversight of "Tyke's." His design is not to be condemned, however, for a seemingly minor point of this kind, but we single it out thus prominently as an index to the style of thoughtlessness which more or less marks other details of his work. For instance, the fowls'-house can only be reached by passing along the feeding-passage of the calves'-house and cow-byre. An outside door for such a place is of the greatest value. "Tyke" has taken pains which we give him credit for, and, architecturally, he is fairly successful. "Agon" fails in this respect, but his plan is more compact; in fact, the stockyard is not spacious enough really, and there is, in general terms, a cramped character about all his arrangements. "Bolebrook" is careful and neat, mindful of ventilators and other contrivances such as hollow walls and the like; he is likely to do better, and will improve if he makes a study of good men's work. "Manxman" draws freely, and recalls something which we have seen before, but not here improved. The idea of the plan is an inclosed courtyard reached by an archway under a sort of tower. "Mist" wastes no effort after architectural appearance; three gables of the plainest kind break up a long façade, and Boyle's air-pump ventilators are relied on for character in the skyline of the group. The plan is fairly practical, but not strikingly so, and the drawings are poorly executed. "Vlan" is more ambitious, and marks his stables by a square, squat tower, which, however, is not large enough for a provender loft. "Vlan's" south elevation is artistically managed, and we ought to have had a better result as a whole from a student who can imagine so good a portion as this elevation. "St. Leonard" has a good plan, and his elevations, though wanting in spirit, are sensible and practical-looking—qualities of the first consequence; but he fails to interest us sufficiently with his outline diagrams. "Mannikin" sends a toy-like design, wanting in breadth and simplicity. We possibly may vex him by using so strong an expression; but if he be wise he will take the criticism in good part and act upon the hint another time. In detail his plan is not good; but we can quite understand that "Mannikin" has done his best, and therefore is likely to improve. "Look" comes next, with a better plan than elevation. The stock-yard should not be separated from the cow-byre, and the dairy ought not to open out of the stable yard. The dairymaids in this plan must needs go through the stock-yard to reach their earth-closet, which is needlessly close to the churn-room. "Charley's Aunt" does not improve much; but the author continues to contribute energetically, which must benefit him in the end if he studies the published designs. This persistent industry is the distinguishing feature of our Club, which has gone so far to make it an established success for nearly a generation, at any rate. Other journals, at home and abroad, have imitated our Club, but have failed entirely in their endeavours, because those who contributed dropped off and lost heart. Some of the most prominent young architects in this country at the present time were "B.N.D.C." men not many years ago. The two remaining designs for the stables are by "Geisha" and "Nil Desperando."

NOTES FROM EDINBURGH.

THE works of reconstruction and expansion in the city have been going briskly on since the opening of the year. The severely cold weather which had lingered far beyond its usual limits of the month of May into June, and so that the

gardens are hardly yet in full leaf, was not accompanied with any protracted snowstorms, and hardly a day has been lost in carrying forward the great amount of work now, and for some time in hand. There has been another rise in wages, and plasterers, before the term, were getting anything they chose to ask.

Great progress has been made with the reconstruction of the North British Railway station and North Bridge. The whole of the arch girders are in position, and, judging from the appearance of the eastern and completed side, the structure has every indication of being as great an improvement as it is conspicuous as a landmark in the architecture of the city. The only thing which strikes the observer as somewhat detracting from the elegance of the design is the unfortunate selection of the freestone in the massive piers, which is far from uniform in colour and texture. The lofty walls, which inclose the property of the company, are much better in this respect.

The station proper is still in great confusion. The old roof is nearly all removed, and the platforms most completed. Much has to be done, however, before access to the platform can be made easy for the increase in summer traffic, as old buildings and the scaffolding of the bridge must be removed. The new access, which runs at a somewhat steeper gradient on the north side of the old, is made and sufficiently finished for traffic. It is carried on massive ironwork, with a handsome parapet at the sides constructed to carry the roofing of the sheds at either side. Near the foot the ironwork, which has arched panels and pilasters, with the usual Classical details, is continued with a balustrade of Ionic pillars, which, with the substructure, are in stonework. The booking-offices are also finished, though they make no appearance as yet, being covered by the lofty screen, which is itself concealed from view by the present booking-office. This department of the new station, which has been described in the BUILDING NEWS, has a most elegant and comfortable aspect, as contrasted with the unsightly appearance of the same at the Caledonian station. The floor has a pretty pattern of Doulton tiles with the Scotch thistle and crest of the company, and the grilles ironwork protecting the flat glass-work in the ceiling has a fine effect. No expense apparently has been spared to make the entrance attractive to the public—and their convenience also has been carefully studied—who have not, as in most stations, to traverse a great length of platform to find the proper waiting-rooms, &c. Good progress has been made also with the lower floor of the railway-offices, where there is a vast amount of heavy brick and stonework; a good idea of this can now be had from the gardens over the Vegetable Market, where there are always a number of observers inspecting the proceedings of the builders below. The walls are mostly all lined with white glazed bricks, and appear to be excellent samples of brickwork.

The town council have decided to expose the building ground of North Bridge-street in separate lots for the convenience of intending purchasers. It is thought there will be more competition and a better price secured in this way than by putting the whole up to auction for £200,000.

The work of preparing the foundation for the extension of the Municipal offices has been completed, or nearly so.

Some progress has been made in the way of realising the architect's design for the decorative details of the National Portrait Gallery. Four statues, at least, have been commissioned, of Dunbar, Hume, Watt, and Sir Henry Raeburn. The capitals of the pillars of the halls, hitherto blocked out only, are being carved with foliage carving, of the Decorated Gothic style apparently, and a commission has been given to W. Hole, R.S.A., for decoration of the walls of the hall and gallery round it with scenes from Scottish history. The great defect of this and other parts of the interior is the want of light occasioned by the unfortunate adoption of red stone and rather dirty red bricks for the finishing of the walls. Even with a strong south light the staircases are dark; it is proposed to lighten up the hall by removing three small rooms on the north side, which will greatly help to make the interior more lightsome.

The Usher site question has not been heard of since the Lord Provost's committee reported in favour of Charlotte-square, but the Canal site is still under consideration. It is certainly more central, and the hall would be much more conspicuous and better seen there than in Charlotte-square, unless the square were denuded of the garden trees.

A JAMES I. BUFFET.

The Prudential Assurance building at the south-east corner of St. Andrew-square is now completed to the roof; it forms a striking addition, both in respect of altitude and style. It has five floors, with a bold, projected eaves-belt course and two attic floors over it, which happens nearly to coincide with the same feature of the adjoining building. It is throughout constructed of brickwork, with surface-facing of polished freestone and polished Aberdeen granite on the ground floor. The style is a chaste and elegant example of the Queen Anne period, common enough in the pages of the *BUILDING NEWS*, but unknown as yet in Edinburgh, and presents a very striking contrast to all the other buildings in the square, which there and elsewhere adhere to the old Classical type of design. It is a brick building, executed in stone to all appearance, and the vertical members dominate. The purely decorative details are few, and very judiciously disposed for good effect. The angle is finished with an octagonal tower or turret, which is finished at the top with an ingenious and very elegant arrangement of windows and gables and inclosed spaces for receiving the roof water. The building is in red stone from Dumfriesshire, which rather kills the beauty of the granite. However well the red sandstone looks in itself or in company with other buildings of the same colour, or with green fields and foliage, the streets of Edinburgh, which are all in freestone of different aspect altogether, have not been improved by its introduction. What they would be like if every other building were red may be imagined, but is not likely to be realised.

Great improvements have been recently made in the National Gallery. The injuries sustained by the tunnelling operations of the North British Railway Company have been all repaired, and the interior, as well as the arrangement of the pictures, presents another and much more attractive aspect than hitherto. The floor has been laid with parquetry, with a black-moulded skirting about 2ft. in height, the walls are a deep red, and the rooms have been apportioned to reception of the pictures so as to illustrate the different schools of painting. The walls are not so much crowded as before, some having been placed in the portrait gallery or otherwise disposed of.

The records of the Dean of Guild Court show still a great amount of work, principally new tenements and alterations. The North British Hotel in Princes-street has got a new front, and is being entirely reconstructed. The principal feature of the frontage, which is nearly finished, is two large circular projecting windows, with polished granite pillars. The Scottish Provident Institution, which has a handsome building in the Barry Club

style, is taking down the plain tenement beside it to extend its accommodation, and foundations are laid for another large insurance building at the north-east corner of St. Andrew's-square.

A JAMES I. BUFFET.

THIS is noteworthy for its unusual character, there being no attempt to inclose any portion for cupboards. The upper portion, which is shallow, has a lift-up top; and one long drawer, with bold contour richly carved, occupies the central part. The buffet is inlaid in many places in light and dark woods; the middle shelf having a geometrical design in reddish wood. The length is about 4ft., the height being the same, and the width 1ft. 6in. The different character of the big acorn-shaped legs is worth noting. Our sketch was made at Christies'.

COAL AS A SEWAGE PURIFIER.

AT a meeting of the Midland Counties branch of the Municipal and County Engineers' Association, held at Stafford on Saturday last, Dr. G. Reid (the medical officer of health for Staffordshire) read a paper on "Sewage Disposal by Artificial Filtration." In the course of his paper, Dr. Reid called attention to a new filtering medium, which, he said, had lately come into great favour in Staffordshire, and which appeared to excel all other media which had hitherto been tried. In fact, so satisfied was he with the results which had been obtained from this filter, that he felt that the time had arrived when an effort should be made to induce the Local Government Board to reconsider their position, and accept efficient artificial filtration as a satisfactory method of disposal without land in cases where suitable land could not be obtained at a reasonable cost. He was no advocate of artificial filtration if it were possible to obtain suitable land; but bad land was worse than useless, as many authorities were discovering to their cost. Dr. Reid then went on to describe the working of a filter constructed by Mr. Garfield, the manager of the Wolverhampton Sewage Disposal Works. Mr. Garfield having had his attention drawn to coal as a purifying medium, had a small filter of fine coal made, in order to see what effect it would have upon the Wolverhampton tank effluent. The results of the analysis made by Mr. Jones, the county analyst, were startling, and he (Dr. Reid), after careful consideration of the question, had come to the conclusion that coal was a valuable and cheap medium for sewage purification. Why coal

should prove so good a filtering medium it was difficult to say, especially considering the fact that, compared with other substances, it was practically non-porous. The Wolverhampton filter had been at work sufficiently long now to establish fairly conclusively that its activity did not diminish with time, and with proper use the life of such a filter need not, as far as could be seen, be limited. One thought occurred to him, and it was whether the immense areas now covered by shale from the mires could not be turned to good account for sewage filtering purposes. The experiment was well worth trying by those authorities who were conveniently placed for putting it to the test. A short discussion ensued.—The Chairman said that coal as a filtering medium was certainly a new idea, and further experiments with it would be watched with interest. He should like to ask whether any chemical change had been noticed in the coal which would account for the results obtained by analysis.—Mr. Cameron (Exeter) defended the "septic" tank treatment he had introduced at Exeter, a system which Dr. Reid had unfavourably criticised.—Mr. Clarkson proposed a vote of thanks to Dr. Reid, and observed that he hoped Dr. Reid would be able to induce the Birmingham Corporation to adopt the system. If they did, they would save many thousands of pounds. The way in which sewage was at present turned into the river was a disgrace to civilisation. Mr. Ayres (West Bromwich) seconded the motion. Mr. Corbett (Birmingham) explained the methods adopted and the results obtained at Saltley, and said he wished that the Local Government Board could be induced to go with the times in this matter instead of holding the local authorities back to the knowledge of twenty years ago. Mr. Jones, the county analyst, said he could not discover that there had been any change in the coal which had been experimented upon. The motion was carried, and Dr. Reid replied, briefly touching upon some of the points which had been raised during the discussion.

A paper had been prepared by Mr. W. Blackshaw, the Stafford borough engineer and surveyor, on some of the engineering works carried out at Stafford. He described the waterworks, the Royal Baths, the sewage works, and the Isolation Hospital, entering at length into the details of each from an engineering point of view. A vote of thanks was accorded Mr. Blackshaw for his paper, and the Mayor was asked to convey the thanks of the association to the County Council for having granted the use of the hall. Subsequently the members were entertained to luncheon, and afterwards visits were paid to the Royal Baths, the Sanitary Depot, the Sewage Disposal Works, the Free Library, the Gasworks, and the Electric Lighting Station.

THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

THE Annual Meeting will be held in London, on Thursday, Friday, and Saturday, the 8th, 9th, and 10th July, 1897. The members will assemble on Thursday, July 8th, at the Westminster Town Hall. The business programme is as follows:—

Thursday July 8th.—10.0 a.m., Meeting of the Council, Westminster Town Hall. 11.0 a.m., General meeting, annual report, general business, election of hon. secretary northern district, re-election of hon. district secretaries, election of auditors and scrutiners, Presidential address, paper and discussion—(1) "Biological Treatment of Sewage," by W. J. Dibdin. 1.0 p.m., Adjournment for luncheon. 2.0 p.m., Papers and discussions—(2) "The Buckinghamshire Road System (Equalisation of Highway Rates)," by E. J. Thomas; (3) "Tramway Haulage," by E. J. Slocok. 4.30 p.m., Adjournment. 6.30 p.m., Annual Dinner at the Trocadero Restaurant, Piccadilly. Circus, tickets 7s. 6d. each.

Friday, July 9th.—10.30 a.m., Westminster Town Hall. Papers and discussions—(4) "Tramways Laid in Asphalted Carriageway Pavements," by L. H. Isaacs; (5) "Brick Paving for Carriageways," by J. T. Eays; (6) "Scavenging of Streets," by W. Weaver; (7) "Shrubs for Parks, Recreation Grounds, &c.," by F. Smythe. Visits to works: (a) The Central London Railway. By the kind permission of Sir Benjamin Baker, permission has been granted for a limited number of the members to visit the Oxford Circus Station of these works at 9 o'clock on the morning of Friday, the 9th July. Tickets will be forwarded to those who apply to the secretary, in the order of application, till the limit of 40 is reached. (b) Messrs. Doulton's works. Those members who are desirous of visiting these interesting works will leave the Westminster Town Hall at 1 o'clock, and take steamer at Westminster Pier for Lambeth Pier, close to the works. The party will be entertained to luncheon by Sir Henry Doulton, after which an inspection of the art studios and other departments will be made. Tickets for this visit will be sent to those signifying their intention to attend.

Saturday, July 10th.—9.25 a.m., Leave Victoria (L. C. and D. Railway) Station by special train to Rochester

Bridge, tickets for which will be obtained at the booking-office at Victoria Station on presentation of the card to be obtained from the secretary. On arrival at Rochester, an inspection of Messrs. Aveling and Porter's works will be made. Afterwards, visits will be paid to the cathedral and to the castle. The members will then be entertained to luncheon, after which a trip on the river will be made, returning from Chatham Station (L. C. and D. Railway) at 4.50 p.m. 5.50 p.m., Arrive at Victoria.

A MICROBE-PROOF HOUSE.

ONE of the oddest domiciles on earth is that recently erected at Yokohama by Dr. Van der Heyden, the noted bacteriologist of Japan. The New York *Home Journal* describes it as a dust-proof, air-proof, microbe-proof building of glass, which stands on the open unshaded grounds of the hospital at Yokohama. The house is 44ft. long, 23ft. wide, and 17ft. high. Large panes of glass $\frac{1}{2}$ in. thick and about 4in. apart are set in iron frames, so as to form the sides of a cellular building block. Of these blocks the walls are constructed. There are no window-sashes, the air-escape being through several small openings around the upper part of the second story, but through which no air from the outside is admitted. The air-supply is obtained from a considerable distance, forced through a pipe, and carefully filtered through cotton-wool to cleanse it of bacteria.

To insure further sterilisation, the air is driven against a glycerine-coated plate glass, which captures all the microbes the wool spares. The few microbes brought into the house in the clothes of the visitors soon die in the warm sunlight with which the place is flooded. The space between the glasses of the building-blocks is filled with a solution of salts which absorbs the heat of the sun, so that the rooms of this house are much cooler than those protected by the thickest shades. In the evening the interior is heated by the salts radiating the heat they absorbed during the day. So effective is the system of regulating the temperature that a few hours of sunlight, even in freezing weather, will render the house habitable. It is only when several cloudy days follow in succession that artificial heat is needed. Then it is supplied by pumping in hot air.

WOODEN STAVE PIPES.

IN a description illustrated in the *Engineering Record* of the power plant of the Pioneer Electric Power Company of Ogden, Utah, the writer gives some interesting particulars of riveted steel pipes, and also of wooden stave pipes. The latter are constructed of Douglas fir furnished by the Oregon and Washington Mills. The wood is planed on all sides to a uniform finished size of 8in. by 2 $\frac{1}{2}$ in. The best timber was specified, perfectly free from knots, sap holes, season checks, and other flaws, and well seasoned and dried. "The pipe was built of 32 staves, the finished staves being 7 $\frac{1}{2}$ in. wide on the outside and 7 $\frac{1}{2}$ in. wide on the inside, and 2in. in thickness. A planing mill for the work of building the pipe was erected near the mouth of Ogden Canon. In this mill both sides of the stave was dressed in a planing-machine to conform to the outlines of a circle; the outside to a circle 38 $\frac{1}{2}$ in. radius, and the inside to a circle of 36 $\frac{1}{2}$ in. radius. The radial surfaces were planed smoothly finished. Steel templates of the stave section were furnished to the contractor and the inspectors, and no stave varying more than $\frac{1}{16}$ in. was accepted." The length of the staves were specified to be 16ft., 18ft., and 20ft. No more than 15 per cent. of the 16ft. lengths nor more than 30 per cent. of 18ft. lengths were allowed, and this condition was fully complied with, and many lengths of 24ft. and 26ft. were used. The staves were made to break joint at least 12in., and at all end joints a steel tongue was used, fitted into grooves sawed into the ends of staves. These grooves had a depth equal to half the width of tongue, and of such width that the tongues fitted tightly. These steel tongues were 1 $\frac{1}{2}$ in. wide and about $\frac{1}{2}$ in. thick, and rather longer than the width of staves, so as to extend $\frac{1}{2}$ in. into the adjoining staves. The pipes were incircled with round steel rods, $\frac{3}{4}$ in. and $\frac{1}{2}$ in. diameter, the latter being used where the pressure exceeds that due to a head of 100ft. These bands were tested to an ultimate tensile strength of between 55,000lb. and 64,000lb. per square inch, an elastic limit of 40,000lb. per square inch, and an elongation of 25 per cent. in 8in. being given. A band consists of two rods

bent to a semicircle, and two steel shoes. Two kinds of rods are used which are illustrated; one of each kind makes a complete ring. The wooden and steel pipes are connected thus:—The steel pipe enters the stave pipe 12in., and is securely bolted. Two angle flanges are riveted to the steel, and the other consists of loose angle irons fastened by bolts. Other particulars are given in the *Engineering Record*, and the sections and details are shown by illustrations.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXII.

PLATE GIRDERS are seldom used now, excepting for small dimensions, in which they are very popular, lattice-girders being preferred for any spans of over about 75ft. The plate girders of the section, shown in Figs. 99–103, in Article XX., are, however, very useful for

Fig. 119.

many purposes, and they are either single or of the box type; the latter being used in cases where the depth is limited, and when lateral stiffness is desirable. The plate girder fulfils the condition of lightness by comparison with combinations of joists, and of cheapness and facility of construction by comparison with braced girders. It is, however, a rather crude structure: it is too heavy for long spans, because it adds too much to the dead weight. The trussed girders are therefore adopted for the latter, because they permit of the best distribution of material, the metal being massed proportionately to the stresses from centre to ends, and suitably for tension and compression. From the point of view of the builder the plated and box girders are attractive, because a wide range of proportions and lengths to suit definite loads can be always obtained. Firms like Dorman,

various outlines with angles riveted round, as shown, and with flanges, plate, and solid web, or braced, or partly plated and partly braced. When the cross-section of a girder has to be diminished more or less abruptly, then the plated type affords facilities of construction rather superior to the braced girders; such cases arise not unfrequently. (Fig. 120.)

In a plate girder there are no lapping joints, but cover-plates only; every plate in web and flanges is planed at the abutting edges and riveted with covering plates on one or both sides, and adjacent angles are riveted together and through the plate with covering angles. These joints are shown in Fig. 121. The rivets are pitched widely, since no caulking is necessary, leaving ample plate section. Rivet-holes in compression members do not weaken the joint if the rivets fill the holes; but rivet-holes in joints in tension lessen the strength at the riveted section. Very generally the same pitch is adopted for both types of joints in a given job. Web covering plates are in some cases used alone; but, in most instances, stiffeners are riveted upon and through them. Stiffeners occur also at intermediate parts, with or without packing strips beneath. Stiffeners may consist of a single angle on one side, or of two angles, one on each side, the rivets passing through each and the plate; or, in deep wide girders and about the centre-parts four angles may be used, two on each side, with a gusset or web, *a*, riveted between each pair, Fig. 122. This method of stiffening would sometimes, when wide flanges are necessary, be preferable to the use of a boxed girder; but the overhanging flanges would not be so well supported, and the lateral stability would not be quite so good; or one or two tees are used, forming essentially four angles. The ends are stiffened by the riveting of end-plates or posts, with angles to the web.

Fig. 121 is drawn to illustrate the usual method of putting together plated girders. The upper figure is a section along the plane *aa* below. A joint between web-plates *A* and *B* is shown at *b*; the joint is covered by two plates, *cc*, of the same thickness as the longitudinal angles *g*. Usually, though not invariably, tees *d* are riveted through the covering-plates and web to stiffen the girder; as well as to reinforce the joint. The length of

Fig. 120.

Long, and Co. supply them made up from stock sections of plate and angles in a practically unlimited range of sizes. Plate girders are used in depths ranging from 15in. or 18in. to about 4ft. and 6ft. Many lattice girders are also made in similar dimensions; but, as a very general rule, girders are plated up to about 3ft. in depth, and are lattice-braced when over 3ft.; shallower girders are braced when the diminution of dead weight is a main consideration and when lightness of appearance is also desired; deeper girders are plated when the opposite conditions exist.

Plate girders are parallel, or fish-bellied, or they are semi-beams, or of irregular outline; they are usually parallel, but not invariably so. The bellied type is used for some purposes in constructional work, chiefly for bridges of short span, fixed, and swinging, the camber being set upmost. As so generally employed on travelling cranes, with the curved edge downwards, they are seldom used in bridge-work, except for transverse girders, partly because the curving down at the centre lessens the headroom beneath, partly because in short-span girders it is cheaper to make the booms parallel than to curve one of them. With long-span girders a bellied form will often be selected with a view to economy of material, and in swinging bridges the bellied form diminishes overhanging weight, and requires less power for operation. The type is, in the latter case, that of the semi-beam; as a semi-beam the plate-girder is employed for carrying roadways and footways of large bridges, Fig. 119. It occurs in

the web-plate is generally the maximum length obtainable for a given width or depth and thickness. In steel the joints are less numerous than when iron was extensively used; a joint between flange-plates *C* and *D*, and *E* and *F* is seen at *e*, and the cover-plates at *ff*. These are made of good length—say, from 2ft. to 4ft.—according to size of girder, being in the proportion shown; it is usual to stiffen the girder at such a joint. Always the longitudinal angles, *gg*, run over web or flange-joints, and are themselves jointed elsewhere as seen at *h*, covering angles *jj* of from 2ft. to 4ft. in length going over the joints; the end-post is shown at *k*, united to the web with angles resting on packings. Girders which are too long for transit are parted at a web-joint and at flange joints next adjacent. The whole of the riveting, except that which must necessarily be omitted for separation, is done, and when the girder reaches its destination the joint-rivets are inserted.

In the building-up of plate-girders it is desirable to observe a uniformity of dimensions of plates and angles as far as practicable; it saves trouble in ordering and in the shopwork. All plates for the web can often be of the same length, and nearly all those for the flanges of another length; angles can be mostly of one length and section, and so can most of the angle and tee-stiffeners and covering-plates. Flange or boom-plates, being narrow, are frequently made twice the length of the web-plates. They must break joint; the end-plates or posts are as wide as the flanges. Covering-angles are from $\frac{1}{2}$ in. to $\frac{3}{4}$ in.

FIG. 121.

narrower than the main angles, according to thickness, so bringing the edges as nearly as possible flush. The flange-covering plates are much longer than web-covering plates, those in tension having to sustain great part of the stress.

Diagonal stiffeners are not often attached to

in Article XX.; but occasionally it is desirable to imitate the device of riveting three rolled joists together, side by side, and thus have three webs in the box girder. It is done for the same reason—viz., when headroom is low, and added width desirable or permissible. Fig. 124 illustrates the sectional form of girders of this

to serve also the purpose of a gutter; it is made of plate and angle. The troughing used in bridge-floors will be considered alone.

The strength of steel girders, both plate and box, is reckoned at about 7.5 tons per square inch of sectional area contained in the flanges. This is suitable for ordinary work, live and dead, and is that adopted in the loads given by Dorman, Long, and Co.

The advantage of the greater maximum dimensions in steel over those of iron is apparent in the

FIG. 123.

plate girders. Fig. 123 shows an example of this kind: it is a portion of one of the cross-girders on the Glasgow Central Railway, upon which girders the street roadway is supported. These are single-webbed, having the usual vertical stiffeners, except in the portion shown, which is pierced with holes for the passage of the gas, water, and electric mains. The diagonal

type which were used on the Glasgow Central Railway, that runs under some of the most busy thoroughfares of the city. These are the heavy main longitudinal girders which carry the cross-girders in Fig. 123, and the arching and the street. Head-room was limited, and the girders are but 3ft. deep. They are 3ft. 2in. wide, and are made of $\frac{1}{2}$ in. steel plates, stiffened at intervals of 3ft. by tee-bars, and in the manner shown.

Circular and segmental girders are required for swing-bridges, for roller-paths, and for live

FIG. 125.

building-up of these plate-girders; less than one-half the number of joints suffices, and the weight of covering plates and cost of rivets is saved. Being rolled larger, and yet being stronger, the weight is diminished in the ratio of about 21 to 30 tons.

J. H.

COLLAPSE OF CAST-IRON COLUMNS.

ANOTHER collapse of a building is reported from New York City. The building was at the corner of the Twelfth-avenue and Fifty-first street. The cause of the failure was the insecure way the cast-iron columns were bolted through the flanges with four loosely fitting bolts at each joint—so often the cause of similar disasters. These columns were, it appears, unbraced, and four stories in height, and carried at the top the ends of floor-beams supporting several tanks, each with its load of water weighing over 80 tons. The columns were only tied together at each floor, and the ends of the beams were all on one side of each column. The description of the collapse of the columns given in the *Engineering Record* furnishes us with some details. The columns were 16ft. to 20ft. apart, and the floor girders were rolled steel beams with wooden joists on the top supporting double floors. Square cast-iron columns set in recesses in the inside of exterior walls each supported one end of a floor-beam at each floor; both framework and walls were independent and separate. Fourteen large square tanks in two rows of seven each, each occupying a separate bay, and all full of water, were carried on this ironwork. Five intermediate ones in the eastern row suddenly fell to the ground, carrying with them all the beams and girders. The columns were hollow cylindrical ones, about 8in. in diameter at the upper stories, with flange connections and shelf-brackets. The splice flanges were on two opposite sides of all columns, and the girders were bolted to them only by three $\frac{3}{4}$ in. bolts at each end. It is said no special care was taken to secure the bearing of these girders on the

FIG. 122.

tee-stiffeners crossing on opposite sides of the web sustain every portion of the plate, and the edges of the tees help to sustain the weight of the pipes. The web-plate is only thickened $\frac{1}{2}$ in. more over the stiffened area than elsewhere, being $\frac{3}{4}$ in. thick there and $\frac{1}{2}$ in. in other parts.

Box-girders are in nearly all cases composed of two single-webbed girders riveted together through the medium of top and bottom plates, the type being illustrated in section in Fig. 103

rings of rollers; they are built of plate and angle. The construction of curved girders is similar to that of straight ones as regards the covering-plates and stiffeners; but they are not quite so easily made; the flanges have to be cut to curvature by punching a number of holes adjacent to the curved edges, which edges have to be finished by chipping and filing; in girders of small radius the edges are turned in a lathe. The web-plates, the angles, and the web-covering plates are bent in rolls.

A trough girder is shown in Fig. 125. It is used to connect vertical columns or standards, and

horizontal cast-iron brackets, to which they were neither bolted nor riveted. The tanks that fell went straight down. Plans and details of the floors and columns with the tanks are given in the *Record*. These tanks were 12½ ft. by 13 ft. on plan, and 15 ft. deep, and were on the fourth floor perched on the columns. A weight of moving water which acted as a live load exercised a severe strain on the beams and columns, each tank-load resting on four columns, or each pair of columns had to carry the load of one tank, allowing half the load to rest on two of the four columns which carried it and its adjacent tank. Each tank, when filled, was calculated to weigh over 170,000 lb. The facts given by our contemporary are of importance to all architects who carry such loads on iron columns at considerable heights above the ground.

MOVING A BRICK CHIMNEY.

THE feat of successfully moving a brick chimney nearly 1,000 ft., 8½ ft. high, of two 8 in. brick walls 3 in. apart, bonded together at intervals, is recorded from Manchester, N.Y. The chimney is 7 ft. square at the base, tapers slightly, and is estimated to weigh about 200,000 lb. The *Engineering Record* gives the following description of the process adopted:—"Holes were cut through the lower part of chimney from side to side, and through them large square horizontal timbers were inserted to project 8 ft. or 10 ft. on each side. On top of these other large horizontal timbers of the same length were laid at right angles to the first one on each side of chimney close to the wall. A double quadrangular cross platform was thus formed, the end of the pair of beams were connected by cross timbers, and from each of these a pair of inclined braces were put up and secured to a timber collar encircling the chimney about 12 ft. or 14 ft. above the bottom timbers. This framework made a cradle that extended the base of chimney to a diameter of over 20 ft. Cross beams were placed under the lower sills of the cradle and supported on timber shoes, which were planed on the bottom and greased to slide on skids 50 ft. long, from which the whole weight of chimney was supported after the lower brickwork had been cut away. These skids were supported on timber crib blocking as much as 5 ft. high in some places where the ground was rough. Grades of 3½ ft. ascending, and 5 ft. per 100 descending, were encountered. The chimney was moved by a single horse working a 30-gear capstan that operated a 5-part (5 in.) chain tackle. The chimney was revolved 90° about its vertical axis, and was loaded, moved, and set on its new foundation in nine days by six men." Messrs. W. H. and C. P. Topping, Bridgehampton, N.Y., were the contractors, and our contemporary is indebted to them for the above data. The timber framework thus practically formed a steady cradle to the brick shaft supported on it, which was made to slide along with its burden by the simple motive power of a capstan. Any chimney might be thus cradled and disconnected from its foundations, and then slid along to its destination.

At a meeting of the antiquaries and archaeologists of the North of England recently held at Newcastle, it was unanimously resolved that a portrait of the Rev. W. Greenwell, F.R.S., should be painted and presented to the library of Durham Cathedral.

At the meeting of the Falmouth parish church restoration committee, on Thursday last week, Mr. Edmund Sedding, the architect, pointed out that the north-east corner of the building should be rebuilt in line with the rest of the eastern end, otherwise it would be impossible to carry out the proposal that the present east window should be placed in the choir aisle. It was decided to accept Mr. Rickard's tender for this work, and also for cementing the whole floor of the building and laying down wood block flooring. These improvements will cost quite £350 beyond the contract price.

Great progress has been made with the doubling of the railway between Probus crossing and Burngallow. The work has been much heavier than might have been anticipated, because at two or three places corners have been cut off, while at Probus the whole level of the line has been raised for a considerable distance, these obviating an incline both ways. The new line is expected to be ready by the end of August, and both lines will be used until the summer traffic is over, when all the traffic will be run over the new line for the purpose of altering the old line.

Building Intelligence.

DARLINGTON.—On the 16th inst. the foundation-stone of the new parochial hall in connection with the parish of St. Cuthbert's, Darlington, was laid by Mrs. Mortimer, wife of the vicar of Darlington. The new hall is an oblong building, two stories in height, with frontage to Victoria-road. In the basement there are a classroom, covered cloister, heating-chamber, &c. The hall is on the upper floor. There are two entrances and lobbies from Victoria-road, one for the general body of the hall, and one for front seats and platform. A small ante-room is provided off the platform. Over the rear of the hall there is a small gallery, reached by open staircase, which also gives access to the basement classroom. The building will be erected with ordinary clamp kiln bricks, relieved by terra-cotta dressings. The roof will be covered with red Staffordshire tiles, and finished with pointed spirelet, which incloses the air-pump ventilator. The main hall will have stained wood panelled dado. The heating will be by open fireplaces and hot water. The contracts for the work have been let to Messrs. R. Kitching and Son, T. Metcalf, R. Smith, J. and G. Wharton, and J. Robinson and Son, all of Darlington. The architects are Messrs. Clark and Moscrop, F.R.I.B.A., of Darlington.

ROTHBURY.—Amongst the many improvements that have taken place in the old Border town of Rothbury during the last ten or fifteen years none has attracted more attention than the block of cottages recently built by Lord Armstrong at the east end of the village. There are in all twelve cottages, six of which are single, and six with kitchen and single room. All the cottages throughout have scullery and pantry, coal and other outhouses being in a small inclosed yard behind. The roof is a common rafter projecting roof, and the tiles which cover it are Staffordshire tiles. The work has been carried out by the following tradesmen:—Mason work, Mr. Thomas Muckle, Rothbury; joiner work, slating, plastering and plumbing by the workmen employed by Lord Armstrong on his estate, under the superintendence of Mr. William Bertram and Mr. James Riddell; the whole being from plans of Messrs. James Stevenson and Son, architects, Berwick.

WINNINGTON.—Owing to the rapid growth of the district, it has been found necessary to build, at a cost of £5,000, a new church at Winnington, near Northwich. The building, which was opened on Monday afternoon, is capable of accommodating 320 persons. It is built of red pressed brick, the nave and chancel being divided by a Gothic arch of white stone. The nave is 69 ft. long, and the chancel 34 ft. 3 in. A tower and spire have been designed for the north side, but for the present this portion of the work will not be undertaken. The structure has been built from the designs of Mr. J. L. Pearson, of London.

CHIPS.

It may be regarded as certain that work will not be resumed this year at Lord Penrhyn's slate quarries, although the notices inviting the men to present themselves are still in force. Lord Penrhyn is leaving next month for Germany, and Mr. Young, the chief manager, has left Bangor for a long holiday. The loss in wages already approaches £250,000. Many of the men are still without employment.

At the Old Bailey on Monday Luke Leonard J. Durant, formerly in business in the City as brick and tile merchant, was sentenced to 12 months' hard labour for forging and uttering acceptances to bills of exchange.

On Thursday week the corner-stone of new shops and house for the Pontefract Industrial Society was laid at Featherstone. The premises will be centrally situated, and building operations commenced about six weeks ago, the architect being Mr. Hirst, Pontefract, and the builder Mr. A. Sutton, Featherstone.

A new Wesleyan mission-hall and Sunday-school were opened in Jennings-street, Groves, a suburb of Hull, by Mr. H. H. Russell last week. The building, which is designed in the Early Gothic style of architecture, is built of red brick, with stone dressings, and comprises a central hall, with gallery to accommodate 600 persons, an infants' schoolroom, seven classrooms, and thirteen other rooms, and other offices. The work has been carried on by Mr. Good, builder, and will cost something like £2,900.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

DUNDEE INSTITUTE OF ARCHITECTURE, SCIENCE, AND ART.—(Session 1897-98). Syllabus of competitions:—No. 1. Best freehand sketchbook of architectural subjects from existing buildings, not less than six pages, in pencil only, not copied from any drawing. Size of page not larger than 10 in. by 7 in. No. 2. Best measured drawings of any architectural subject, in black and white, and not more than four nor fewer than two sheets, containing plan, elevation, and section to ¼ in. or ½ in. scale, and detail of a part to 1/12th full size. Measurement books to be lodged. Size of drawing, 21 in. by 14 in., with margins or mounts beyond drawing not exceeding 4 in. No. 3. Best work in modelling or carving of any of the following:—(a) Cornice, not exceeding 12 in. by 9 in. by 18 in.; (b) one quarter of centre flower, not exceeding 21 in. by 21 in.; (c) key-stone, not exceeding 18 in. by 12 in.; (d) lock-plate and door-handle, not exceeding 21 in. in height. No. 4. Best outline drawing, from an antique subject in the Dundee Art Museum of Casts or from duplicates thereof. Size of work, 22 in. by 14 in., with 4 in. margins or mounts. No. 5. Best design in colour for any of the following subjects:—(a) Interior decoration of a private library, dining or drawing room, (b) wall and ceiling paper, (c) door-panel, (d) tile or parquet floor, (e) mosaic tympanum. Conditions:—The first and second of these competitions are limited to architects' apprentices in Forfar, Perth, and Fife. The others are open to anyone under 25 years of age, as at 31st January next, residing in Forfar, Perth, or Fife. The following conditions are applicable to all the competitions:—The competitions are not confined to members or associates of the institute or their assistants or pupils. The subjects submitted must be specially prepared for these competitions. The prize for each competition will be of the value of £2 2s., and in such form as the successful competitor may prefer. All the works submitted to be under motto, and accompanied by a sealed envelope bearing same motto, and containing the name and address of the competitor, and all to be delivered free to the hon. secretary, at the institute rooms, on or before 31st January, 1898.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—This year Chatsworth House was selected for the annual excursion, and the excursion on Saturday was one of the pleasantest ever held. Amongst those who took the trip were Messrs. Joseph Smith, vice-president, C. J. Innocent, F.S.I., F.R.I.B.A., hon. secretary, T. H. Waterhouse, J.P., Benjamin Bagshaw, E. M. Gibbs, F.R.I.B.A., W. J. Hale, H. Webster, J. Norton, J. T. Cook, A. Holland, J. C. A. Teather, C. F. Innocent, A.R.I.B.A., T. Myles, L. D. Hemsoll, W. Denton, F. J. Innocent, C. F. Bond, T. H. Robinson, and F. Wilson. Mr. B. Bagshaw, who is a "lay" member of the Society, was appointed cicerone, and fulfilled the duties of his office admirably. Peculiarities of the stonework at the entrance having been commented upon, a visit was made to that portion of the house usually shown to the public. The tour concluded with a visit to Queen Mary's Bower, and many were the opinions hazarded as to the time of erection and object of the strange, moat-surrounded building. No satisfactory conclusion was come to, but there was general agreement that the building was erected before the time of Queen Mary.

After undergoing alterations, Wolsingham parish church was on Saturday duly consecrated by the Bishop of Durham. The church has been enlarged by the addition of a baptistery; a new floor of wooden blocks has been laid, the nave has been entirely re-seated with oak benches, and a new altar and pulpit of massive oak have been provided. The architect is Mr. C. Hodgson Fowler, of Durham. The works have cost between £700 and £800.

New chancel stalls of carved oak, erected as a Jubilee memorial, have been placed in St. James' Church, Exeter. They are of decorated Gothic design, and carry richly carved finials on the bench ends carried out in foliage patterns. The fronts are worked as a traceried arcade and carry suitable inscriptions. A good effect is produced by recessing the priests' seats on either side into the Hamhill piers of the chancel arch, thus enabling the central passage to be kept of good width. The work is from designs by Messrs. Fulford, Tait, and Harvey, of Exeter, and has been admirably executed by Mr. E. T. Rogers, carver, of that city.

GROUND PLANT.

FRONT ELEVATION.

Diagram illustrating a vertical shaft with two scales. The left scale is labeled "FEET" and ranges from 0 to 20. The right scale is labeled "TO PLANS" and ranges from 0 to 20. The shaft is labeled "IRON ELEVATION" and "TO ELEVATIONS ETC.".

FIRST AND SECOND PREMIATED DESIGNS FOR THE NEW TECHNICAL SCHOOL, SUNDERLAND.—RESTORATION OF THE TOWER OF THE CHURCH OF ST. JOHN THE BAPTIST, CARDIFF.—“BUILDING NEWS” CLUB DESIGN FOR A SMALL COUNTRY STABLE.—A RELIC OF THE TUILERIES.—FOUR SOMERSETSHIRE PULPITS.—A JAMES I. BUFFET.

Our Illustrations.

PROPOSED TECHNICAL SCHOOL, SUNDERLAND.
(SELECTED DESIGN.)

THIS design was placed first in public competition, Mr. J. M. Brydon being the assessor, and the view shows the principal front to Green-terrace, with the return to the small back lane. The main floor is placed about 8ft. above the pavement at corner of site, and has, adjoining the principal entrance, the secretary's room, inquiry office, janitor's room, principal's room, and common room for staff. On the left is the hall, suitable for examinations or public lectures, lit on both sides, with doors from the entrance hall, and a special porch at the opposite end. From the hall a main corridor gives access to classrooms, lavatories, &c., whilst two staircases lead to the upper floor. Above the hall is the chemical laboratory, with balance and combustion rooms. The corridor is immediately over the one below, and, similarly, gives access to the various classrooms. On the top is the caretaker's residence, and the corner tower contains a room for clock and chronometer testing, from which a staircase leads to the telescope dome above, nautical astronomy being one of the subjects for which special provision has to be made. In the basement are physical laboratories and physics lecture theatre, rooms for carpenters and plumbers, and spare rooms to be allotted for other purposes. Room is left upon the site for extension, and eighteen ordinary classrooms can be provided. The sum proposed to be spent is £17,000. The design is by Messrs. Potts, Son, and Hennings, of 9, Ely-place, Holborn, and 34, Victoria-buildings, Manchester, and was selected from about forty others.—*Second Premiated Design.*—This practical scheme, illustrated also by view and plans, obtained the second position in the same competition. The arrangements are clearly defined on our drawing, and so need little description here. The different treatment of the problem is very interesting, and, architecturally, the façades are equally diverse. Messrs. Woodhouse and Willoughby, of Manchester, are the authors of this design.

TOWER OF ST. JOHN THE BAPTIST'S CHURCH, CARDIFF.

IN the year 1473 (over four centuries back), the foundation-stone of this beautiful tower was laid, and it was owing to the munificence of Lady Anne, daughter of the Earl of Warwick, that this building was erected. It was designed by one Hart, an architect, who was also the author of the fine towers of Wrexham and St. Stephen's, Bristol. These three towers are all of the Perpendicular style; but St. John's is not so rich as the other two, possibly on account of the funds he had at

his disposal (which too often hampers an architect very much in carrying out his designs). However, Hart has placed his ornamental work where it can be seen for miles around, for the embattled parapet, with its graceful pinnacles, is certainly a landmark of ancient Cardiff which the inhabitants of the present time should be justly proud of. One of the angle turrets was struck by lightning in 1860, and had to be rebuilt. The parapet was supported about 45 years back with iron bars, to which may be attributed much of its insecure condition at the present time. The carving on the pinnacles is much worn, but in the drawing I have shown it restored to its original form. The belfry windows are full of rich tracery, and no one would imagine from a distance that there was so much detail in them. This drawing also shows the windows restored. Time, weather, and smoke have done much to destroy the beauty of the work. The doorway is, no doubt, belonging to the early 13th century church, of which portions remain, and must have been built into the tower when it was erected. The street at the present time is about 2ft. 3in. above the original ground, thereby dwarfing the height of the west entrance. The drawings produced were prepared from actual measurement after the scaffolding was erected. The cost of the restoration will be about £2,800. Messrs. S. Shepton and Son, of Cardiff, are the contractors. C. B. FOWLER, Architect.

“BUILDING NEWS” DESIGNING CLUB: A GROUP OF STABLE BUILDINGS.

For descriptions and awards see page 6.

A RELIC OF THE TUILERIES.

THIS illustration shows a portion of the magnificent façade on the garden front which De l'Orme executed for Catherine de Medicis. It also shows one of the horseshoe staircases, by means of which the garden was reached from the raised arcade of the ground story. The building is shown as it appeared after the troubles of 1871, when, during the struggle between the Versailles troops and the Communards, the Tuileries were destroyed by petroleum and gunpowder. Even after this, the walls remained standing, and might have been restored; but they were fated to be razed to the ground, which was done in 1885, and the building, once the glory of Paris, has entirely disappeared. We are indebted to the *American Architect* for the illustration which we herewith reproduce.

STATUES, MEMORIALS, &c.

BRISTOL.—The foundation stone of the Cabot Memorial Tower was laid at Bristol last week. The design was furnished by Mr. W. V. Gough. The tower is to be a square structure of an ornamental character, adapted from a well-known example in the department of the Loire, in France. It will have buttresses at the angles from base to summit, and in order that it shall not appear heavy, the sides of the square, reckoning to the outside of the buttresses, will not exceed 27ft. There will be two stages, each of which will be relieved with an ornamental balcony, adding much to the appearance of the structure. The floor of the upper balcony is to be 75ft. from the base, and above this will be carried an octagonal spire of 30ft., making the total height about 105ft. A circular staircase of fair width will go up the centre of the tower to the first stage, and above that there is to be a spiral staircase for the second stage, and should a lift be required in the future, the well-hole of the tower forms a convenient position for it. The style of the design, although original, is typical of the style prevalent in England at the time of Henry VII. The spire of freestone is to be surmounted by the figure of Peace (or Commerce) mounted on a globe typifying the world, and it is proposed to gild these, so that they may be very conspicuous from a distance. Provision is to be made at the base for the insertion of panels with bronze bas reliefs, one of which will be reserved for the Bristol inscription, and the others are proposed to be filled in by the American subscribers and the Peace Society. The platform will be square, and it is proposed to make it about the same dimensions as the familiar circular inclosure on Brandon Hill—about 42ft. across. At its angles will be projected bold epaulments for the reception of the Russian trophy guns.

THE HIGH CROSS OF DOWNPATRICK.—After a strange eventful history and a long period of neglect and forgetfulness, the grand old Celtic cross of Downpatrick has been quietly re-erected in the ancient city in which it stood for so many centuries. The Dean and Chapter of St. Patrick's Cathedral have given a site for the cross, and it now stands erected on the grass triangular plot at the east end

of the cathedral—facing the road leading up from the city. The stones of the cross consist of the base or die—the shaft—and the arms and nimbus ring, the coping or cap-stone being still undiscovered. These three stones, with an additional base stone, which was a necessary insertion owing to some injuries to the base proper, are now fitted together with care and precision, and form a cross 11ft. high. No attempt of any kind has been made to “restore” the ornament. The base stone has no trace of ornament left. The shaft on its east face has four panels, the two centre ones each containing three full length figures, and the upper and lower panels, which are only half the size of the centre ones, contain half-length figures, all evidently being Scriptural subjects, but now so worn as to be past recognition. The south side of the shaft has one panel its full length, containing a rich interlacing Celtic pattern closely worked at each end, and expanding to greater freedom in the centre. This is the most legible ornament on the cross. The stone above the shaft, which extends into the arms, bears in the centre the crucifixion of the Saviour—dimly visible on its weather-worn face. The angles of the cross bear evidence of having once had a round—possibly a rope-moulding; but this has suffered so much that many might consider it was splayed or chamfered. The work of restoration has been carefully carried out by Mr. Wm. Hastings, builder, Downpatrick, under the supervision of Mr. William J. Fennell, architect, Belfast.

WATER SUPPLY AND SANITARY MATTERS.

BEDWORTH.—Last week General Crozier, Local Government Board inspector, held an inquiry into an application of Foleshill Rural District Council to borrow £3,775 for the purposes of a public water supply. Evidence was given by Dr. John Orton (medical officer of health), Mr. H. B. Nicholls, Birmingham (engineer), and Mr. A. P. Oswin (clerk to the Foleshill Rural District Council). It was stated that the estimated population of Bedworth was 6,000, and that the yield of the well was 210,000 gallons a day, or more than double the requirements of the town, presuming that the consumption was 15 gallons a head. The inspector stated that the storage capacity was only five gallons per head, and the engineer replied that it could be easily doubled. General Crozier pointed out that the mains should be extended to Bulkington-lane canal bridge and the Woodlands. There was no opposition to the scheme, which, the inspector stated, appeared satisfactory with the exception of the points referred to.

ETON SEWERAGE.—Fears having been entertained for some time past that the sewers of Eton are in an unsatisfactory condition, and that the storage tanks at Datchet permit of great leakage from the surrounding subsoil water, especially during times of flood, and that in consequence the annual cost of pumping the sewage on to the sewage farm at Eton Wick is much greater than it should be, the urban district council have requested Mr. E. Bailey Denton, M.Inst.C.E., of Palace Chambers, Westminster, to advise them thereon, and to report upon what steps should be taken to remedy existing evils. The college and masters' houses were drained only a few years back, and are in a satisfactory condition; but the town sewers were laid and pumping-engines erected in 1869, when sanitary science was by no means so far advanced as at the present time.

SALFORD.—An application of the Mersey and Irwell Joint Committee for the issue of a peremptory order against the Salford Corporation, requiring them to proceed with a scheme ordered by the Local Government Board for effectually dealing with the sewage effluent, was before his Honour Judge Parry at the Salford County Court on Monday. In the course of the hearing the town clerk intimated that the application which the council had made to the Local Government Board for borrowing powers would be withdrawn, and for the purpose of carrying out the scheme of the corporation money would be borrowed under section 235 of the Public Health Act, 1875. They objected to being compelled to purchase more land, inasmuch as they could satisfy the joint committee by merely doubling the area of filtration. Ultimately his Honour adjourned the hearing until July 22.

WILMSLOW SEWERAGE WORKS.—At Wilmslow Sessions, on Tuesday, the Wilmslow District Council applied for an extension of time in connection with their sewerage works. It was stated that important works had yet to be carried out on the southern side of the district. The northern scheme has just been completed at a cost of nearly £7,000, and £12,000 has been expended in the southern district. The Mersey and Irwell Joint Committee had agreed to six months' extension. The Bench granted the extension.

Mr. E. Guy Dawber, of 22, Buckingham-street, Adelphi, has taken into partnership Mr. Francis A. Whitwell, and the firm will in the future be Messrs. E. Guy Dawber and Whitwell.

A RELIC OF THE TUILERIES.

J.C. HALDEN. 1896

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 6s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXI. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIV., LV., LVIII., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

* In response to complaints from readers that they are unable to get the BUILDING NEWS at Messrs. W. H. Smith and Son's bookstalls, we can only suggest that they should order the paper of some other newsagent. Messrs. W. H. Smith and Son recently requested us to allow them an extra discount beyond that allowed to the general trade, and because we declined they have ceased to send the paper out to their bookstalls. We have, of course, no remedy; but we do not think the demand was a fair one.

RECEIVED.—M. W. D.—C. L. I. Co.—H. S. F. (Bristol).—S. E. S.—A. T. F.—M. F. and Sons.

Correspondence.

NEW CITY HALL, BELFAST.

To the Editor of the BUILDING NEWS.

Sir,—Mr. Miller calls my attention to your having been under the impression that Messrs. Malcolm Stark and Rowntree's design was placed second in order of merit in the recent final competition. Will you allow me to explain that no official distinction was made as to the respective merits of this design and that of Mr. Miller?

The numbers referred to in my letter to you of April 15 were merely those assigned to the designs before examination by the assessors?

Perhaps you will kindly communicate this to your readers.—I am, &c.,

JOS. C. BRETLAND, City Surveyor.

Town Hall, Belfast, June 28.

DEVIATIONS TO CONTRACTS.

Sir,—Extras and deductions, as a rule, are bugbears. The former, if not the latter, cause frequently many bitter feelings between the parties concerned—client, builder, and architect—the latter in most cases being thanked by neither, but rather blamed by both.

Where to draw the line as to these is the question. Minor points, such as small deviations, are simple, but, say, if one of three or four of the buildings contemplated to be erected, and forming about equal proportions of contract price,

were decided to be added to or deducted from contract as the works proceed, could the contractor be expected to stand by the schedule of prices deposited for carrying out such a purpose? In the matter I am interested in, it is a question of adding a building, probably increasing the contract by a sixth; but the legal adviser to the board proposed the work should be tendered for, as he says the contractor can scarcely be expected to do it at schedule prices, being an addition, and consequently more than an ordinary extra, yet no doubt he (the contractor) would equally demur to another builder coming on to the work in case he misses the job by tendering.

Hoping the subject may be of sufficient interest to cause the views of some of your experienced readers to be given on the matter—I am, &c.,

TOLOP HAX.

Intercommunication.

QUESTIONS.

[11694].—**Sound.**—Is there any means of preventing the passage of sound through party-walls of semi-detached houses?—W. T. T.

[11695].—**Pillars.**—What is gained by bolting pillar feet plates to ordinary foundation pillar pier capstones—for do not the bolt-holes weaken the stone at the angles, and in case of there being any strain on the bolts by the leverage of the pillar becoming even so little out of the perpendicular, are not the outer angles and edges of stone liable to be forced off?—DOUBTFUL TOMMY.

[11696].—**Reservoirs or Dams.**—Is there a good book published at a reasonable price on the construction of ordinary reservoirs or mill dams, with the necessary fittings and accessories required thereto, giving practical information, with examples of work, suitable for the supply of mills, villages, and small towns?—ENQUIRER.

[11697].—**Continental Technical Schools.**—Can any of your readers give me the names of some of the most complete and up-to-date technical schools on the Continent, a visit to which would repay an architect during his holidays?—C. C. C.

[11698].—**Heat-Resisting Paint.**—Will white-lead or red-lead, mixed with paraffin oil, dry hard, or will it always remain greasy?—G. A. HAIG.

[11699].—**Vegetable Growth in Hard-Water Tanks.**—What is the reason of a peculiar vegetable growth which forms in the course of a few months on the surface of the water? It is very much like frogs' spawn, but of a darker colour, and about 2in. thick. What would be the remedy for it?—HARRY ABBOTT.

[11700].—**Pond Water.**—Near my house is a large pond, from which I am desirous of taking water for laundry and other domestic purposes, but not for drinking. The pond is supplied by springs; but being stagnant, the water becomes green, and is unfit for use. I may state I have made a tank about 7ft. from the pond, and made a filter-bed of washed gravel for the water to run through; but this does not purify it enough to be fit for use. What can I do?—ONE IN A FIX.

REPLIES.

[11683].—**Elliptic Arches.**—I am much obliged for the replies of "Voussoir" and "Geometric" in your issue of 15th ult. Neither of the formulae kindly given by them is applicable to any proportion of span and spring of arch. What I want is a rule for striking an approximation of an elliptic arch from three centres—or, in other words, forming it of three arcs (or the complete approximate ellipse of four arcs from four or two pairs of centres)—and that from any predetermined span and spring (or height). "Voussoir" asks whether the five-centred arch is a more pleasing one. Yes, it is, and the rule for it is precise, but too long to quote here. It is to be found in Vere Foster's drawing book, "Practical Geometry," part R. 2, post free 2d. (Blackie and Son, Paternoster-row). In Angel's "Practical Plane Geometry" (Collins and Sons, Bridewell-place, E.C.) will be found the same rule extended to eleven centres. But both are too complicated for ordinary artisans' use: the more centres, the nearer the approximation, but the more complication. The rule is capable of extension from five centres to any odd number above five indefinitely. What I want is to simplify the rule from five to three centres, and from those three centres to draw three arcs, so as to set out an arch of an approximate semi-ellipse in any proportion, high or flat; but hitherto I have not been able to do so. The nearest I can get to it is a very empirical rule-of-thumb method. Draw an oblong with one of the longest sides as the horizontal base, bisect it with a perpendicular drawn down from the top of the oblong indefinitely below it; set off on each of the vertical ends of the oblong a point at one-third of the height from the bottom. From these two points draw lines to the vertex of the bisection of the oblong. Mark the points on the sides of the oblong A and C respectively, and the vertex of its bisection B. These two lines from A to B and from B to C will form chords. Bisect these two chords, and so find a centre on the perpendicular line from which to describe an arc through the points A, B, and C. Then by trial find two centres on the base of the oblong, from which can be described arcs connecting the two ends of the base with the arc before described. Lines drawn from the bottom centre through the two last-mentioned centres and continued until they cut the arcs will give the points where the arcs truly join with tangents truly in the same line. Will any reader give me, or refer me to, a true rule instead of my empirical one? "Geometric" says the "trammel method is the most accurate." That is true for drawing an accurate ellipse, and there are other equally good methods—e.g., by ordinates and by a cord secured to the foci; but the essence of my question is that an arch of approximate semi-elliptic form may be struck from

three centres without the use of any of the methods for drawing the true ellipse (which cannot be struck), and of any given proportion of span and height? It is usual in a semicircular arch springing from projecting impostos to slightly tilt it to correct the optical illusion which otherwise would make it appear less than half a circle. Is it necessary also to correct an elliptical arch in the same manner, and, if so, how much, and does the "how much" depend upon the proportion between span and spring, and upon the height from the eye?—J. W. S.

[11690].—**Tile-Hung House.**—The walls may be covered with plain tiles fixed to battens of 1½ by ¾ of oak. These battens are fixed to the studs or uprights. Oak battens are the best to use, as the fire is apt to split. The tiles are hung in the usual way; nibs are cast along their upper edges, and angle tiles are made for the external and internal angles. The space between the studs can be filled in with brick; sometimes these are laid herring-bone fashion. There should be a springing fillet at the lower edge, and a moulded course of brickwork is sometimes seen; but the lower course of tiles should form a drip, and project 3in. or 4in. from the wall-face below. Against the window openings or reveal it is not necessary to have the tiles fixed unless the reveal is considerable.—A. G.

[11691].—**Ornamental Plasterwork.**—The only comprehensive treatise is that lately published by Mr. Batsford, Holborn, and entitled "Plastering: Plain and Decorative," by William Millar, plasterer and modeller. It is a practical work, and dealt with by a practical plasterer.—G. H. G.

[11692].—**Architect's Responsibility.**—It is not easy to answer the question put by "Justice": What is the extent to which an architect may be held responsible for defects? "Justice" may be sure that the architect is not responsible for such accidents as he mentions; if he were, he would be answerable for any trifling defect which showed itself, and this would be unreasonable.—G. H. G.

[11693].—**Party-Walls.**—The four descriptions you refer to are given as follows by Emden:—A party-wall may mean, first, a wall in which the two adjoining owners are tenants in common, as in "Wiltshire v. Sidford" and "Cubitt v. Porter," the most primary meaning. Second: It may signify a wall divided longitudinally into two strips, one belonging to each owner, as in "Watts v. Hawkins." Third: It may mean a wall which belongs entirely to one of the adjoining owners, but is subject to an easement or right in the other to have it maintained as a dividing wall. Fourth: It may designate a wall divided longitudinally into two moieties, each moiety being subject to a cross easement in favour of owner of other moiety.—G. H. G.

CHIPS.

Hampstead Vestry has decided to cease watering its principal streets on Sundays. This is a huge blunder. Hampstead is just the very place where the dust ought to be prevented by watering, and Sunday is the very day in the week when most people would be benefited from it in summer.

Mr. R. G. Thomas, architect, has received instructions to prepare plans, &c., for a new organ chamber and choir vestry for the Menai Bridge church, and the same architect has recently completed the restoration of the old parish church, the cost of which, together with a memorial window, was defrayed by Mrs. Norman, of Menai Bridge.

Three cottage homes, built by the Hunslet Board of Guardians for the accommodation of children hitherto inmates of the workhouse, were opened at Rothwell Haigh last week. Three of the homes have room for 20 children in each, and the remaining two for 14 each. The total cost of the undertaking has been £8,500. Mr. E. J. Dodgshun, of Leeds, was the architect.

A new memorial window has just been placed at the east end of St. Matthias' Church, Barbados. It is richly coloured and especially painted for the strong light of the West Indies. This window, unlike many others in the same island, is constructed with stone mullions and tracery, which were carved in London. It is in the style of Early 14th-century Gothic, and was designed by Mr. C. P. Rogers, assistant surveyor, R.E. Civil Staff.

A memorial window has been placed in Livingston Free Church, N.B. It cost about £300, and occupies the south gable of the church, and consists of three lancets 25in. in breadth, 13ft., 15ft., 13ft. in length, and a mullion of 14in. between them. Each lancet has two groups of figures, filling up its length without crowding it, six in all. They represent the six scenes of the passage in Matthew xxv. 34-40. Messrs. Dickson and Walker, of Edinburgh, executed the window.

Messrs. E. H. Shorland and Brother, of Manchester, have just ventilated Baines school, Blackpool, by means of their ornamental patent exhaust roof ventilators and special inlet tubes.

It is proposed to erect a new chapel near to Hemsworth in Yorkshire for the Primitive Methodist Connexion, with seating accommodation for 200 people. Ultimately a much larger building will be erected, when the present proposed building will be used for school purposes. The architect is Mr. J. P. Earle, of Sheffield, who has erected several chapels for the same religious body.

New stables are being erected at Bretby, Burton-on-Trent, and special attention has been given to the ventilation, which will be carried out on the Boyle system.

PARLIAMENTARY NOTES.

THE PLUMBERS' REGISTRATION BILL.—On Wednesday, on the order of the day for the consideration of this Bill as amended by the Standing Committee, General Laurie (Pembroke and Haverfordwest) rose to move that the Bill be considered that day three months. He took this somewhat unusual course because the measure had obtained a second reading somewhat unexpectedly. That the Bill had not been carefully drafted was shown by the fact that the hon. member in charge of it had himself put down 20 amendments upon the paper on the present stage. Objection to the measure had been taken by the National Association for Promoting Technical Education, by the City and Guilds of London Institute, by the Association of Organising Secretaries and Directors, by the Association of Technical Institutes, by the London Polytechnic Council, by the committees and principals of London Polytechnic institutes, by the County Councils Association, and by the technical education committees of 32 county councils and county boroughs. The objects of the Bill were, he thought, desirable to a large extent, but the measure contained many objectionable features. In the first place, it did not prohibit the practising of unqualified plumbers. It further proposed to take the control of the training and examining machinery out of the hands of the bodies that were now efficiently supervising it, and to place it exclusively as regarded the whole of the United Kingdom in the hands of the master and wardens of the Plumbers' Company. This was an extraordinary proposal in face of the fact that since 1881 the City and Guilds of London Institute had examined more than 10,000 candidates for registration, and that when the Government of the day placed a large sum of money in the hands of the county councils for the purpose of carrying into effect a system of technical education, the City and Guilds of London Institute were called in to aid the county councils in establishing the necessary machinery. Why should these bodies who had done such good work be superseded by the Plumbers' Company, who were a new body altogether in connection with this subject? The Plumbers' Company had already a right under their charter to supervise the training and examination of plumbers within three miles of the City; but that was no reason why that power should be extended over the whole of the United Kingdom, to the exclusion of those possessed by other bodies. His object in moving the rejection of the Bill was that it should be sent back to the promoters with the view that it might be redrafted by them in conjunction with the City and Guilds of London Institute. He begged to move that the Bill be considered that day three months. Mr. Lloyd Morgan (Carmarthen, W.) seconded the motion. —Mr. Lees Knowles (Salford, W.) thought that the hon. and gallant gentleman had no right to complain that the Bill had passed a second reading, seeing that it had been approved by the House in 1892. With regard to his hon. friend's attack on the Plumbers' Company, he should explain that it was not the company who initiated this movement of their own accord. They were asked to do so by the great London Congress on Hygiene of 1884, and still more recently by the International Congress of 1891 in a resolution moved by the Lord Provost of Edinburgh and supported by representatives of municipal authorities in England and Scotland. The Plumbers' Company was, in fact, asked to deal with the subject because it was looked upon as the most competent body. The evidence given before the Select Committee showed distinctly that there was no desire to create a monopoly.—General Laurie: A monopoly of registration is what I complain of. —Mr. Lees Knowles said his hon. friend was honourably connected with the City and Guilds of London Institute, and he inferred that his chief object in opposing the Bill was to substitute the institute for the company throughout the Bill, at all events, to give it a prominent place. But he was credibly informed that the examination of the City and Guilds of London Institute could not be accepted for registration purposes, for various reasons. His hon. friend had found fault with the "machinery" of the Bill. The machinery already existed, and they wanted to legalise it. If there were any omissions from the centres of examination, they could be supplied by amendments. As to expenses, if the hon. gentleman thought insufficient provision was made in the Bill, he could move to amend the fees. The cost of this legislation was to be met out of the company's funds. If any reasonable and proper attempts were made to amend the Bill, he for one should be only too willing to accept them.—Mr. Hobhouse (Somerset, E.) said nobody would depreciate the long-continued labours of the hon. member for Salford on behalf of the measure, nor the excellence of the ultimate object at which they aimed—viz., the promotion of the public health. But grave considerations, educational and otherwise, were raised by the form in which the Bill came before the House; and he doubted whether it was possible in the limited time available this Session to produce a

measure that would satisfactorily attain the object aimed at. He had been asked by the County Council Committee and by some of the great technical institutes which gave instruction in plumbing and the allied sciences to enter the strongest possible protest against the Bill in its present form, and to ask the promoters of the Bill and the Government, who had taken it under their patronage, to consider carefully whether large concessions ought not to be made to those who for many years had shown a very practical and substantial interest in the improvement of the plumbing industry. The object of the Bill was twofold—to improve plumbing, and to give the public protection against incompetent plumbers. As to the second object, the second subsection of clause 13 raised grave apprehensions that the Bill would do more harm than good. It proposed to put on the register every employer of plumbers in connection with the businesses of builders, ironmongers, sanitary engineers, or other like occupations who were engaged in the business prior to the 1st of March, 1892. It was a pretty large order that all these gentlemen were to be put on the register without any test examination whatever. He ventured to ask whether a register which began in that way was likely to be any protection to the public whatever. Was it not far more likely to mislead the public, when every person who came into any one of these wide categories was to be entitled to advertise himself as a plumber registered under the Act? The second, and, perhaps, more important, object of the Bill was the improvement of the plumbing industry. Why he objected to the measure in its present form was that it practically ignored those authorities—with the exception of the Plumbers' Company—who had spent money and trouble for years past in improving the plumbing business. There were at least 15 county councils and 36 county boroughs in England alone that held plumbing classes in various parts of the country, and the students educated every year by these local authorities had increased from 1,550 in 1892 to 3,498 in 1897. These authorities, almost without exception, utilised the examinations of the City of London Guilds—an institution which the Bill practically ignored. The secretaries and others interested in technical education had, as a whole, agreed to certain resolutions proposing large modifications in the provisions of the Bill relating to the examinations, as they did not desire to see the Plumbers' Company made the statutory examining body, being satisfied with the complete and thorough tests of the City of London Guilds. This was the first proposal that had ever been seriously made to register the members of a trade as distinguished from the members of a profession, and the House ought to see that in establishing what might be a great guild, controlling a trade, and in close connection with a City company, such a measure as this was based on sound and satisfactory lines, which might be made applicable to other trades if need be. The local authorities that had spent so much money on technical education ought to be adequately represented on the council it was proposed to set up, and unless concessions were made in the directions he had indicated, he and others who felt with him would be under the necessity of voting for the amendment.—Mr. T. W. Russell (Tyne, S.) desired to state at once what the views of the Government were upon this question. The House would do well to remember that this was not a Government Bill, but that of a private member, which received a second reading without any intervention on the part of the Government at all. The debate came on at half-past 11 o'clock at night, and the only way in which the Government interposed was that after the principle of the Bill had been affirmed by the second reading, they supported a motion referring it to a standing committee. The Bill went to such committee, of which it was quite true that he was a member, and he considered it his duty, as representing the Local Government Board—the public health department of the country—to do what he could to make the measure as workmanlike as possible. But in doing that he by no means took any responsibility for the Bill, which was one the House must deal with from its own standpoint. The proposal made had been described by his hon. friend as unusual. He himself thought it was not only unusual, but that it was perhaps a little unreasonable. What was the brief history of this question? This Bill had been before the House for something like six or seven years. In 1892 it was read a second time, and sent to a select committee. That select committee took evidence, and reported the Bill to the House. In 1893 the Bill was again introduced, read a second time, and referred to the standing committee on trade, that committee, he understood, refusing to proceed further with it because the Local Government Board was not represented upon it. Then the Bill was introduced this session, read a second time, and sent to the standing committee on trade, by whom it was largely amended, he admitted, at the instance of the Local Government Board. Neither in 1892, 1893, nor in 1897 had any local authority, guild, or institute demanded representa-

tion. The rejection of the Bill had been moved because claims had not been fairly considered which had never been made! The motion was not only unusual, but unreasonable. The Government approved of the principle of the Bill, thinking that in the interests of public health there should be registration of plumbers. (Hear, hear.) The Bill practically placed the entire control of the examinations, and everything connected with the Bill, in the hands not so much of the Plumbers' Company as of the general council, which consisted of eight master plumbers and eight operative plumbers. Urban and rural district councils, and councils of boroughs had been mentioned in the Bill, and not the county councils, because the former was intrusted the carrying out of the law relating to public health. The great distinction between the examinations of the Plumbers' Company and those of the guilds and institutes was that the latter, as far as practical workmanship was concerned, were purely optional, but those of the Plumbers' Company were absolutely compulsory. The Lancashire County Council were so much impressed by this fact that they conducted their examinations under the Plumbers' Company's rules, because the company's examinations were not only theoretical, but practical. He admitted that in the clauses of the Bill there was room for improvement as regarded the machinery of the Bill. The Government would keep an open mind with respect to the amendments on the paper, and he asked the House not to prevent their consideration by rejecting the Bill.—Mr. Whittaker (York, W.R., Spen Valley) objected to the Bill, owing to the source from which it sprang, and the purposes at which it aimed. The object of the promoters of the Bill was not the improvement of the public health, but to secure a monopoly for a trade and privileges and powers for a City company. The latter were taking advantage of the feeling about plumbers to get traders and work-people generally into their hands. The masters and workmen were willing to assent to an arrangement of the kind, because examinations and fees would tend to keep men out of the trade. The plumbing trade had suffered severely in recent years, because of the tendency of large firms to undertake the plumbing with the gas-fitting, decorating, drains, and the electric light. Plumbers could not embrace other trades and so other trades were embracing theirs, which was being gradually squeezed out as a separate trade. This was why the plumbers were supporting this Bill. Mr. Anderson, president of the United Operative Plumbers' Association of Great Britain, in his evidence before the standing committee, admitted his desire to have plumbers' work taken out of all general building contracts and made separate. He thought that a man who was a plumber pure and simple would give more time and attention to his business than a general builder or contractor could give to the plumbing. The general builder, he added, should not capture profits that would come to the plumber alone. Mr. Anderson's evidence showed that a monopoly for his trade was alone what they were aiming at, and not the improvement of the public health. It was the little men who did the work badly, and these little men wished to secure these special advantages. Registration would not secure better work. But the difficulty in the trade was not want of knowledge, but want of conscience—not want of skill, but want of honesty. No system of registration would provide honesty and conscience, and the Bill would do nothing in securing competent workmen. The employer of a plumber might be a competent man and get registered, but the Bill made no provision that the men that he employed were competent men. The whole thing was a delusion, and would do a great deal of harm. It would create false security. Then it was said the jerry-builders gave plumbing work to a Jack-of-all-trades; but the Bill would not prevent that. As showing the methods by which the City companies worked, only the previous night the Plumbers' Company were dining members of that House. It was not a creditable thing to the company or the House.—Mr. Lees Knowles: I did not attend the dinner.—Captain Pirie (Aberdeen, N.): I attended it. (Laughter.)—Mr. Whittaker went on to argue that the general council would give no protection; it would merely transfer the powers of the company. The Plumbers' Company wanted to retain in their own hands the training of teachers in their technical schools, as well as the registration of plumbers, for it all meant big fees. No wonder that strong protests against the Bill had come from the great technical education institutions of the country under the control of the county councils. Mr. Lees Knowles pointed out that the Plumbers' Company had, at the suggestion of county councils, held their examinations in five centres. Mr. Whittaker contended that the registration of plumbers should not be in the hands of a City company; and, even if it should, this was a clumsy and impossible measure. It should be withdrawn and introduced next session, with the City company wiped out of it and a body thoroughly representative of technical education formed for the purposes of the Bill. This was the first occasion on which the House was asked to provide registration for an ordinary trade. It would

belooked upon as a precedent in the future, and it was therefore worth while to see that the first measure was a reasonable, sensible, and workable measure.—Dr. Farquharson (Aberdeenshire, W.) hoped that the House would be allowed to get the discussion of the practical part of the Bill.—Mr. Burns (Battersea) was going to oppose the Bill lock, stock, and barrel. He dissented entirely from the view that there was a need for the Bill to the extent represented. When the Bill was conceived 10 or 15 years ago, local authorities neglected plumbing and were somewhat indifferent to sanitation, and the plumbing trade was perhaps at its lowest ebb. But since that time there had been a revolution, he was glad to say, in domestic hygiene and sanitation, and local authorities had made considerable headway in undoing the mischievous neglect of the past. The Bill put a ring fence and a protectionist inclosure round the small master plumber, who was being knocked out by the more scientific large builder and the skilled master plumber who employed good workmen at excellent rates of wages. He did not believe there was any public necessity for the Bill or a particular demand for it, or that, given those conditions, this was the best way to bring the reform about. A man might pass the highest examination as a plumber, and he might be smothered in certificates; but if economic pressure on the master and commercial incentive in the workman made both conspire to poison a customer with typhoid or sewer gas, no amount of certification or registration would prevent that undesirable end. What they had to do in the matter of plumbing was what public authorities had done in regard to everything. They had to test the work when performed, leaving complete freedom of action in carrying it out, just in the same way as the local authority did in the matter of house and other drains. The plumbers would have on the council an overwhelming majority against the sanitary inspectors; but the history of all sanitary reforms in construction of drains and sewers was that improvements had been secured by outside experts and educated public opinion, and so it would be with plumbing. Of course, he was in favour of men of all crafts being educated, plumbers included; but the Bill would interfere with the educational authority of the many institutions that had sprung into existence in connection with technical education. The certification and registration of plumbers would have no effect in producing good working; the Bill was not wanted, and would simply lead to espionage. It would create a class of workmen who would cram through the examination, and rest content, not seeking to develop the trade through their merit, their polytechnic, or their master. It was an attempt to construct a ring fence round a trade against the interests of sanitation and the public welfare. Because the Bill was not wanted; was badly drafted; because it would create a class of city corporation plumbers, fortified with certificates and disliking hard work; and because it would, by local registration, tend to interfere with the mobility of labour and check the versatility of industry, he should vote against the third reading.—Mr. Bucknill (Surrey, Epsom) said the county of Surrey had taken an active part in technical education, and had taken an interest in the education and improvement of practical operative plumbers, and he therefore wished to say a few words about this Bill. The Surrey County Council had expressed a strong opinion in favour of the object of the Bill, and thought that it was a good Bill, which, however, required amendment. After listening to the speeches which had been made, he had come to the conclusion that the Bill should be allowed to proceed. He admitted that there were clauses which would apparently clothe the company with too much power, and which, it might be argued, would injure those bodies and associations which had spent a considerable amount of money in the education of the operative plumber. The London County Council had not criticised the Bill in a hostile manner, but had confined themselves to an amendment of a purely formal character. Everyone had spoken in favour of the principle of the Bill except the hon. member for Battersea. It would not injure the plumber, but would place him in a better position. The recorded opinions of the plumbers themselves in their resolutions passed at various meetings were in favour of registration, and the British Medical Association and municipal corporations and county councils had petitioned in favour of the Bill.—Mr. Acland (York, W.R., Rotherham) said that what they had to take into account in considering whether they were to support this Bill was what the attitude of the House of Commons ought to be in setting a precedent in regard to the registration of this or other trades. Though the principle of the Bill might be a good one, its method was thoroughly unsatisfactory. Since this Bill was first introduced the great county and urban authorities had been set up, and in view of the steps they were taking to improve technical instruction, it would seem that they were the bodies to whom the duties involved in this Bill should be intrusted. By Clause 9 the Plumber's Company was constituted the chief authority under the Bill

for examination and registration. Surely it was possible for the company to show its interest in education in the way in which other companies had done. It seemed to him that the local authorities, who both in London and many parts of the country were developing their work in connection with technical instruction, ought to hold a position entirely different from that which they held under this Bill.—Mr. Wolff (Belfast E.) failed to see why a London company should be set up as the examining authority in this matter. He thought it was most unjust and most unfair. The Bill seemed to him about as defective as any Bill could be. He objected both to its principles and its details. It was most unfair that any class of workmen should get a degree, as it were, by examination by a private London company, and so assume a superior position to other workmen.—Mr. John Ellis (Nottinghamshire, Rushcliffe) wished to say a few words as chairman of the grand committee to which the Bill had been referred. What the House had heard that day was really a second reading debate. He had noticed in the committee that both the promoters and opponents of the measure were without that guidance which a useful second reading debate always afforded. The promoters of the Bill were rather at sea when amendments were proposed in committee, and the result was not satisfactory. That afternoon's debate ought to have taken place before the Bill went before the grand committee. It would be a serious thing if the House of Commons were to place crude legislation of this kind upon the Statute Book. Even if all the amendments which appeared upon the paper were inserted in the measure, he doubted whether it would thereby be made satisfactory. He noticed that the promoters of the Bill themselves had put down a large number of amendments. In the circumstances he was inclined to think that the House would be wasting its time by proceeding further with the measure.—Sir J. B. Maple (Camberwell, Dulwich), thought that the Bill was unnecessary, and condemned it as a crude attempt at legislation.—Mr. Holborn (Lanarkshire, N.W.), supported the Bill on the ground that it was in the public interest. He agreed that sanitary plumbing had made an enormous advance in the past ten years, and he thought that the chief object of the Bill would be to keep workmen abreast of this advance by means of education.—Sir J. Leng (Dundee) thought that if any trade should be registered, it was the plumbing trade. Plumbing work was concealed, and bad work was only known by its effects. Disease was spread in our homes and generated in our cities by bad plumbing work; therefore it was desirable that the education of plumbers should be attended to. Mr. Brigg (Yorkshire, Keighley) asked why plumbers should be selected for special treatment in this way. They were not the only workmen connected with the hygienic construction of our buildings. Why should similar plans not be taken to examine and classify builders and the men who lay down drains as well as plumbers? The real cause of the deficiency in the work of plumbers and others connected with the construction of houses was to a large extent due to the cheap system of contracting and the cheap materials which were employed. It should be remembered also that there were a large number of tramp plumbers, whose services were utilised by cheap contractors. These men were exceedingly careless in carrying out their work. It was absolutely necessary plumbing work should be inspected before it was covered up, so that it might be ascertained whether it had been properly done. The present system of registration of plumbers was good as far as it went, and he objected to its being interfered with. The system provided by the Bill was not one he felt justified in accepting, and he should vote against the Bill. (Hear, hear.)—Mr. Wylie (Dumbartonshire) said the Bill was an honest attempt to grapple with the subject, and it would be successful in spite of certain deficiencies in the measure. He insisted on the importance of inspecting the work of repairs, especially in the dwellings of the poorer classes. Faulty repairs too frequently led to disease and death.—Mr. Pickard (York, W.R., Normanton) said as a labour representative he should support the Bill, and there were strong reasons why labour members should vote for it. Because the Bill might be badly drafted, that was no reason why it should be rejected, and the promoters of the Bill were willing to accept any reasonable amendment.—Mr. Goddard (Ipswich) opposed the Bill on the ground that it afforded no guarantee that the public health would be promoted by it. It set forth that certain people should be registered as qualified and certificated plumbers, but there was no guarantee that certificated plumbers would be generally employed. The Bill did not insist on plumbing being done any more efficiently than now. Much mischief was done by jerry builders who ran up cheap houses for the poorer classes, and there was nothing to compel them to employ registered plumbers so that the sanitary arrangements of the houses of the poor might be efficient.—Mr. Bayley (Derbyshire, Chesterfield) considered that the Bill in its present

shape did not carry out a single principle it proposed to deal with.—Mr. Muntz (Warwickshire, Tamworth) regarded the Bill as objectionable in the form in which it had been presented, and failed to see why plumbers should be registered any more than bricklayers.—Sir W. Foster (Derby, Ilkestone) observed that the Bill had been before the House for some years, and he was sorry that during that period it had not developed into a better Bill than it was at the present time. Still, it had the germs of good in it, and he should be sorry to see any amendment carried which would postpone its consideration. The argument that plumbers should not be registered because bricklayers were not had neither justice nor logic in it, and if adopted would put an end to registration in any trade whatever. He wanted to begin with the registration of those trades on the efficiency of whose work the health of the people depended. Plumbers were more intimately connected with health than any other trade. If bricklayers desired registration, they could have it, and in the mean time the registration of plumbers would have the effect of saving a few lives annually in this country, they should endeavour to secure its adoption. It was objected that the Bill proposed to register persons who had been practising as plumbers since 1892. Anybody who had studied the history of registration would find that that was the course which had always been followed; and they were bound to recognise the members of the trade or profession it was proposed to register who were practising at the time a Bill such as this passed. But afterwards they would only put people on the register who had passed an examination which he hoped would go up step by step until it became more perfect, and until they had in this country a body of registered plumbers who knew their business properly, who had learnt that amount of science necessary for effective sanitary plumbing, and whose knowledge would prove invaluable in protecting public health. The object of the Bill was a good one. It sought to introduce into a very important trade the system of selection by which competent persons would do the work, and on that account he thought it ought, at all events, to receive the sanction of the House as regarded the present stage. The Bill was not a perfect one, and was open to amendment in many ways; but believing that if it were passed it could be made a measure that would be of benefit to the country, he should vote against the amendment, being convinced that in so voting he should be voting in favour of a step in advance in sanitary legislation. The House then divided. For considering the Bill, 200; against, 77; majority for, 123. The House then proceeded with the consideration of the Bill. Clause 1, giving the short title of the Act, having been agreed to, on Clause 2, "This Act shall commence and take effect from the first day of January, 1898, hereinafter referred to as the commencement of this Act," Sir C. Dilke (Gloucester, Forest of Dean) moved as an amendment to substitute for the words "from the first day of January, 1898," the words, "such date after the first day of August, 1898, as the Local Government Board may fix by order published in the *London Gazette*." If there was any real intention of passing the Bill in the present session it would have to be very much simpler, and would have to be virtually framed by the Local Government Board. If this amendment were carried, he should be prepared to move to leave out the greater portion of Clauses 3 and 4, and the schedules, and to propose that the rules for the election of the governing body should be left entirely to the Local Government Board.—Mr. Burns hoped the amendment would be accepted. Unless the rules were framed by some such body as the Local Government Board, he predicted that many of the authorities who had petitioned for the Bill, and some of the educational institutions that were not opposed to it, would abandon the Bill, or ask to have it repealed, in consequence of the complexity of its machinery.—Mr. T. W. Russell said he must decline to accept the amendment of the right hon. gentleman. He did not believe that the arrangements for the establishment of the general council were unworkable; but, at all events, the Local Government Board could not take the responsibility of devising the perfectly new machinery which was proposed.—Mr. Warner said it was not a question of the Local Government Board nominating the members of this council, but simply of their drawing up rules for their election. After some further conversation the House divided on the amendment. For, 97; against, 176; majority against, 79.—Mr. Kimber (Wandsworth) moved to omit from the proposed title of the council "General Council of Plumbers' Education and Registration" the words "Education and." The object of the amendment was to limit the operations of the council to registration.—Mr. Hobhouse supported the amendment. The proposed council would be a body entirely unsuitable for the supervision of the education of plumbers. For the whole of England and Wales (exclusive of London, in regard to which a more reasonable proposal was made) two-thirds of the General Council of 24 members were to be connected with the

plumbing trade; and the remaining eight were to be members of the council of a borough, or other urban or rural council, or medical officers of health, or inspectors of nuisances, who were to be elected of large constituencies consisting of persons carrying on any trade employing plumbers, operative plumbers, and the members of the borough, urban, and rural councils. Could any body so elected be regarded as a proper educational authority? The largest proportion of this enormous electorate would be connected with the plumbing industry; and the result would undoubtedly be that the council would consist almost entirely of persons belonging to that industry. Such a body might be a very suitable one for registration; but it could not be said to be a suitable body to regulate without any control from a central authority the education and examination of plumbers. It was true that 20 additional members were to be elected by the general council from the nominees of a long list of sanitary institutes, technical colleges, and plumbers' associations; but this addition could not be said to render the general council a fit body to exercise control over education. Except in the case of London, there was no guarantee that the whole of this council would contain a single representative of the local authorities which were doing so much for the technical education of plumbers at present.—Mr. Lees Knowles hoped that the amendment would not be pressed.—Mr. Burns supported the amendment.—Sir W. Foster said that all registering bodies were necessarily concerned with education. The council would supervise without attempting to compete.—Mr. T. W. Russell resisted the amendment. The Committee divided, and the numbers were—For the amendment, 123; against, 153; majority against, 30. It being after half-past five o'clock, the debate stood adjourned.

LEGAL INTELLIGENCE.

PLANT V. BOURNE.—(Court of Appeal, June 24, before Lords Justices Lindley, Lopes, and Chitty). This was an appeal against a decision by Mr. Justice Byrne. The action was brought by a vendor for the specific performance of a contract for the sale of land. The purchaser resisted specific performance upon the ground that the contract did not contain a sufficient description of the land to satisfy the Statute of Frauds. The agreement was in the following terms:—"An agreement made the 12th day of February, 1896, between Robert Plant, of Putney, in the county of Surrey, gentleman, of the one part, and Robert Henry Bourne, of Trentham, in the county of Stafford, station-master, of the other part. The said Robert Plant agrees to sell, and the said Robert Henry Bourne agrees to purchase, at the price of £5,000, 24 acres of land freehold, and all appurtenances thereto, at Totmonslow, in the parish of Dracott, in the county of Stafford, and all the mines and minerals thereto appertaining; possession to be had on March 25th next, the vendor guaranteeing possession accordingly." The agreement was signed by both the parties. The plaintiff proposed to adduce evidence to prove that he was the owner of freehold land at Totmonslow, containing 24a. 1r. 26p.; that at the date of the agreement the defendant was well acquainted with the land; that he had, on Feb. 12, 1896, by appointment, gone over and carefully examined the land with the plaintiff; and that the agreement was afterwards entered into. The learned Judge refused to allow this evidence to be admitted, and held that the requirements of the statute were not satisfied. He accordingly declined to enforce specific performance. The plaintiff appealed. The Court allowed the appeal. Lord Justice Lindley said that he was unable to take the same view as the learned Judge had taken. The objection to the agreement was that it did not specify what 24 acres the purchaser agreed to purchase. The vendor contended that he was at liberty to show, by parol evidence, what was the subject-matter of the contract. The learned Judge held that the evidence was not admissible. He conceded that parol evidence was always admissible to identify the property; but he said that the property which was to be identified must be more clearly specified. In "*Ogilvie v. Foljambe*" (3 Mer., 53) (in 1817), Sir W. Grant, M.R., said that parol evidence could be admitted to show to what house and what premises an agreement to purchase "Mr. Ogilvie's house and to give £14,000 for the premises" related. That being so, all difficulty vanished in the present case. That decision of Sir W. Grant had always been regarded as an authority. It was followed by the Court of Appeal in "*Shardlow v. Cotterell*" (20 Ch. D., 90). The Court would be simply splitting hairs and making a distinction without a difference if it were to adopt the view put forward by Mr. Astbury for the defendant. The appeal must be allowed. Lord Justice Lopes and Lord Justice Chitty gave judgment to the same effect.

THE INDUSTRIAL DWELLINGS CO. AND THE PUBLIC HEALTH ACT.—At Southwark Police Court on June 24 Mr. Slade gave judgment in regard to an important sanitary prosecution, which had been before the Court at various times during the past

three months. Mr. Slade said the Metropolitan Industrial Dwellings Company (Limited) was summoned before him by St. Saviour's District Board of Works for disregard of a certain sanitary notice served upon them in respect to No. 7 Block, Mowbray Buildings, Red Cross-street. At the commencement of the hearing it was contended that the notice was bad, inasmuch as it ought to have specified the nuisance complained of under subsection B of the second section of the Public Health Act; and also that the company were not liable under section 4, as persons "by whose act, default, or sufferance" the nuisance arose, and "Reg. v. Parly" was relied upon. He thought that in the circumstances the notice was sufficient, and that the defendants were the persons upon whom it was properly served. He was aware of the difficulty which existed in carrying out the necessary alterations, owing to the limited space of ground upon which Mowbray-buildings stood, and he could not allow the question of expense to influence his decision, seeing that the Industrial Dwellings Company was a commercial speculation, competing with the common lodging-houses, which were carried on under stringent regulations. In his opinion the building could not at present be considered to be in a sanitary condition. He imposed a fine of 40s., and ten guineas costs. It was arranged that similar summonses with regard to six other blocks of the same dwellings should stand adjourned, in order that the defendant company might consider whether they would appeal against the magistrate's decision.

RIGHTS OF OWNERS OF BUILDING PLOTS.—The Master of the Rolls delivered the judgment of the Court of Appeal on June 24 in a matter affecting the rights of parties who buy land for building purposes. Some years ago a Mr. Brawn purchased of Lady Robinson a plot of land at Kingsthorpe, and built a house upon it, when, afterwards, a Mr. Revitt bought an adjoining piece of land, and erected upon it a house which Mr. Brawn complained obstructed his light and air. An action was brought by the latter, but it was dismissed by the Northampton County Court judge, whose decision was affirmed by a Divisional Court. The Court of Appeal now held that as Lady Robinson had reserved the right to deal with the other plots of land in any way she pleased, the plaintiff's claim against her successor in title failed, and the appeal was dismissed.

LIABILITY FOR REPAIR OF SEA WALLS.—The storms having damaged the sea-wall known as the Esplanade at Sandgate, a question arose between the Kent County Council and the Sandgate District Council as to who was liable for the expense of the repairs. The arbitrator appointed by the Local Government Board decided in the main for the District Council. Last Friday the Court of Appeal reversed this decision, on the ground that the promenade which was injured was intended as an attraction to visitors, and was not a highway for the use of the county generally.

THE LONDON COUNTY COUNCIL AND THE BUILDING ACT.—At the South-Western Police-court Mr. J. L. Schiefer, of Grove Mansions, Clapham Common, was summoned by the London County Council for having committed a breach of the Building Act by erecting wooden structures at the rear of the mansions without a license and did suffer the same to remain. Mr. Chilvers represented the Council, and Mr. W. R. Warren defended. The defendant was fined 10s. a short time since for erecting the structures without a license and the contention of the Council was that he was liable to daily penalties as long as the building was allowed to remain. Mr. Warren argued that as the defendant had sold his interests in the buildings he could not go on another man's premises and pull the buildings down. Mr. Francis said if he accepted the contention the defendant would be liable to penalties until the end of his days. He was of opinion that the summons had been taken out under the wrong section and therefore dismissed it.

BUILDERS AND BY-LAWS.—At the Birkenhead Borough Police-court, before Messrs. Wm. Jackson and T. L. Dodds, Cecil Edward Maples, of 14, Cook-street, Liverpool, was summoned for that he being a person laying out a new street exceeding 150 yards and not exceeding 300 yards in length—viz., a street in continuation of Mulberry-road there—unlawfully did lay out such street so that the width thereof is not 36ft. at the least. Mr. Fearnley, prosecuting solicitor for the Corporation, appeared for them, and Mr. Layton represented the defendant. Mr. Fearnley said the defendants had deposited plans for laying out a new street 30ft. wide continuing Mulberry-road from Wycliffe-street to the Mersey Railway and then to be continued about right angles in a southerly direction under the name of Ashley-street, continuing as such on the western side of the railway for 83 yards and then turning again at right angles towards Wycliffe-street again in a westerly direction. The street thus formed three sides of a square, the back of Wycliffe-street forming the fourth side. The Corporation contended that though this street had two names it was really one street, as the length of a street had to be taken from the

point of entrance to the point of exit. Treating this street in this commonsense way Mulberry-road and Ashley-street formed one street exceeding 150 yards in length and therefore should be 36ft. wide. By consent of the defendants, who wished the point settled, they were to be treated as though the street were actually laid out, but as a matter of fact the street as yet existed on paper only. Mr. Charles Brownridge, borough surveyor, was called to prove the plans and show that these two streets were in fact one and should be treated as such. For the defence Mr. Layton contended that in reality this was three streets, and should be treated as such. Mr. W. Jackson said that after hearing the surveyor and examining the plans they had decided that what should be looked at was the object of the by-laws under which these proceedings were taken. These were for the purpose of securing proper ventilation and preventing a congestion of traffic. In this case there would be no ventilation interfered with, because the end of the street abutted on the Mersey Railway, neither could there be a congestion of traffic, because carts would prefer the direct line along Wycliffe-street. The Bench were therefore of opinion that these were practically three streets and not one continuous street, and gave a verdict for the defendant, with costs—three guineas.

RE ROBERT CAMPBELL.—This debtor was examined by Mr. Dibb at the Manchester Bankruptcy-court. He had carried on business as a joiner and builder at Altrincham and Broadheath. Liabilities, £325; assets, £115, leaving a deficiency of £210. The causes of his failure, he said, were loss on a contract through miscalculation and want of capital. In a contract he had omitted to allow for £157 10s. for plumbing work. He had also lost £11 in bad debts and £25 in law costs. He expected that his assets would not realise a penny. If he had had time he believed he could have paid all his creditors 20s. in the pound. He had looked after the books of a friendly society for a number of years, and had neglected his own.—The examination was closed.

RE E. CAPPS, BUILDER, FELIXSTOWE.—This was also an adjourned examination, the statement of accounts filed on the last occasion showing a deficiency of £1,010 19s. In compliance with an order made by the Registrar the debtor had filed a further statement showing how his deficiency had arisen. He was now examined by the Official Receiver upon certain items included in this first statement, and he stated that he had undervalued the houses he had at Felixstowe, and the mortgagees were content with their security, the effect of which would be to reduce his liability by £600. Questioned by Mr. Messent as to certain other items, the debtor said there was £80 claimed by Messrs. Palfreman and Foster for goods for two houses at Chiswick, for which he was once contractor, but he had thrown up the contract, and the goods were sent afterwards. Judgment was, however, given against him in respect to that amount, but that was because the item was included in a bill in which were items of goods for which he was indebted, and he had not money enough to put in a defence, which would have involved his paying the larger amount first. The examination was provisionally closed.

RE JOHN LIMN.—A receiving order has been made in the case of John Limn, of Gough-street and Canton-street, Poplar, builder and contractor, Messrs. E. C. Kilsby and Son being the solicitors to the proceedings. The liabilities were estimated at under £1,000.

SURFACE WATER SEWERS.—DURRANT V. BRANKSOME URBAN DISTRICT COUNCIL.—This was an appeal (before Lords Justices Lindley, Lopes, and Chitty) against a decision of Mr. Justice North (reported in the *Times* of April 12 last, and in the *Times* Law Reports, Vol. XIII, p. 359). An important question arose as to the right of local authorities, in making up new roads, to turn new surface-water sewers into the natural watercourses of the basin in which those roads lie. The plaintiffs are the owners, as trustees, of the Durrant Estate, a large property, in its general character a building estate, situate partly in West Bournemouth and partly in the district of the Branksome Urban Council. The upper part of the river Bourne flows in a deep valley through the plaintiffs' property, the channel through which the river now flows being an artificial one. A portion of the valley is let to the Bournemouth Corporation for the purpose of public gardens. Owing largely to the nature of the soil, the stream, which in times of flood is liable to overflow, brings down a quantity of sand and silt, much of which is deposited in the bed of the stream and tends to choke the channel. Measures are taken by the owners of the estate, by means of "stops" or dams, and by from time to time digging out the deposited silt, to obviate the evil thus caused. It was stated that the average amount of sand dug out of the stream within the plaintiffs' estate in the course of a year amounted to 50 tons before the defendants constructed the drains which are the subject of complaint in this action. The defendants have recently taken in hand the making-up of a number of

roads in their district, situate almost entirely in the basin of the Bourne, and in so doing have laid down new surface water drains or sewers, which discharge into the upper part of the Bourne, where it flows through the Durrant Estate. The usual gullies and catchpits have been constructed, and thus stop a great deal of the silt from the roads; but, especially in times of storm, a large quantity of this material is washed with the rain-water into the stream. The roads thus drained by the defendants are mainly under their own jurisdiction, but are as to a small portion—viz., the Poole-road, which is a "main road"—drained by them by virtue of an agreement with the Dorset County Council. The plaintiffs complained that the increased flow caused by the defendants' works produced extra flooding and extra deposit of sand and silt, and they sought an injunction to restrain this discharge of water, sand, silt, or solid matter through the defendants' drains or other artificial works into the Bourne. Section 15 of the Public Health Act, 1875, provides that "Every local authority shall keep in repair all sewers belonging to them, and shall cause to be made such sewers as may be necessary for effectually draining their district for the purposes of this Act." By section 16, "Any local authority may carry any sewer through, across, or under any turnpike road, or any street or place laid out as or intended for a street, or under any cellar or vault which may be under the pavement or carriageway of any street, and after giving reasonable notice in writing to the owner or occupier (if on the report of the surveyor it appears necessary), into, through, or under any lands whatsoever within their district." By section 17, "Nothing in this Act shall authorise any local authority to make or use any sewer, drain, or outfall for the purpose of conveying sewage or filthy water into any natural stream or watercourse, or into any canal, pond, or lake, until such sewage or filthy water is freed from all excrementitious or other foul or noxious matter such as would affect or deteriorate the purity and quality of the water in such stream or watercourse, or in such canal, pond, or lake." And by section 308, "Where any person sustains any damage by reason of the exercise of any of the powers of this Act, in relation to any matter as to which he is not himself in default, full compensation shall be made to such person by the local authority exercising such powers." By section 9 of the Private Streets Works Act, 1892, (this Act has been adopted by the defendants), "The urban authority may include in any works to be done under this Act with respect to any street or part of a street any works which they think necessary for bringing the street or part of a street, as regards sewage, drainage, level, or other matters, into conformity with any other streets (whether repairable or not by the inhabitants at large), including the provision of separate sewers for the reception of sewage and of surface water respectively." Mr. Justice North dismissed the action with costs, holding that the above quoted sections authorised the defendants to do what they had done. The plaintiffs appealed. The Court dismissed the appeal with costs. Lord Justice Lindley was of opinion that the learned Judge had rightly construed the sections of the Public Health Act. It was important that section 308 gave a right to full compensation to the landowner. All the roads in question were in the defendants' district. His Lordship thought the point about the Poole-road came to nothing, for the duties of the defendants in relation to that road were, by section 11 of the Local Government Act, 1888, the same as if it were not a "main road." The plaintiffs had canalised the Bourne in 1877; whether it would properly be called a "canal" his Lordship did not know. His Lordship read section 15, and said that by the definition section (section 4) the word "sewer" included not merely a sewer for the removal of filth, but also a sewer for ordinary drainage purposes. The defendants were draining some roads in their district. Section 16 was important. (His Lordship read it.) It had been urged that no report of a surveyor as to the necessity of what the defendants were doing had been obtained. But that point was not really raised in the action. The action was brought for a much more important purpose—to contest the defendants' right to make the sewers altogether, not for the mere purpose of delay till the report of a surveyor had been obtained. The word "lands" in section 16 must include land covered with water. Though section 17 was not an enabling, but a prohibitory, section, the inference to be drawn from it, taken in connection with the other sections, was very strong. It said in effect, notwithstanding the previous enabling sections, You shall not pour filthy water into any stream, watercourse, or canal. What was the inference? That you may pour in any other water. That was the view taken by Mr. Justice North. Reading the sections together, his Lordship thought that the defendants were right. The appeal must be dismissed.—Lord Justice Lopes concurred. Section 15 was very clear, distinct, and large. Section 16 was very important, and if there was any doubt about its meaning

it was made clear by section 17. The inference was irresistible—viz., that if water was free from the impurities mentioned in section 17 the conveying of it into any stream, watercourse, or canal was authorised. In the present case there was nothing affecting the purity of the water carried by the defendants into the Bourne. And full compensation for any damage caused to the landowner was provided by section 308. Lord Justice Chitty had formed a clear opinion that the defendants were justified in what they were doing. Section 15 imposed on them a duty to make sewers, and section 16 gave powers for the carrying of the sewers which it was their duty to make. Section 17 must be read partly as a proviso and partly as an enabling clause. The first part of the section was prohibitory, the second part was explanatory. His Lordship would not say that section 17 of itself conferred a power; it was explanatory of section 16. The Legislature assumed that what they had already said justified the pouring of pure water into a stream, watercourse, or canal. There could be no question that silt was not foul or excrementitious matter. The value of section 308 was very great. As a rule, the Legislature did not interfere with private rights without providing compensation, and under section 308 the plaintiffs could obtain full compensation for any damage done to them by an increase of the sand or silt carried into the Bourne by the defendants' drain.

RE JAMES BROS.—Upon the application of Messrs. Pownall and Co., a receiving order was made on Saturday under a petition presented against Messrs. James Brothers, trading as builders at 8, Clifton-street, Finsbury. The petitioning creditors were Messrs. Daniel Norton and Sons, of Wharf-road, City-road. No particulars transpired.

Our Office Table.

THE electric-lighting works of the Shoreditch vestry, which were opened by Lord Kelvin last Monday, constitute a very remarkable municipal enterprise. The undertaking comprises, in addition to the electric-lighting plant, a dust destructor and public baths and washhouses, while a public library and museum and a municipal technical school are built on the same site. The destructor cells are capable of burning 20,000 tons of ashbin refuse a year, and the heat given off by the process is calculated to be sufficient to provide electric light and power for public street lighting and for private purposes for Shoreditch, and also to heat the adjoining baths and washhouses. It is stated that at a preliminary test 150lb. pressure of steam has been raised from dust alone, without the use of any coal, and that the results promise to be more favourable even than has been calculated.

A LETTER has been received by the Yeading District Council from Mr. Vickers Edwards, the county surveyor, in reference to the gift of Mrs. Brown, of Bramley, of the sum of £500 for the object of planting trees on the Dudley Hill and Kilinghall-road, from the Four Lane Ends, near the Peacock Inn, to Coney Lodge Bridge. In this letter Mr. Edwards states that the County Council most distinctly object to any trees being planted on the wayside likely to interfere with the width of the road, as the boundary extends from fence to fence. The reason for objecting to an avenue of trees is, that when such trees have had a few years in which to grow, they practically meet overhead, and exclude the action of the sunshine and wind from the road, which, of course, would have a very detrimental effect on the road. A road when covered in by trees is always wet, is bad to maintain, and is cut up with the slightest amount of vehicular traffic. Of course, if the council persisted in doing this, the county council would have to take such steps as the law allowed.

A SAND-BLAST apparatus was experimented with in removing the paint from the hull of the United States cruiser *Atlanta*, with the result of doing the work with great rapidity. A similar experiment was made later on the columns of the viaduct at One Hundred and Fifty-fifth-street, New York City, which were erected in 1890, and needed repainting. The removal of the paint and scale, exposing the clean iron surface, was most thorough, the rate being about 1sq.ft. in two minutes.

IN furtherance of their desire to remove the remaining bars and gates which obstruct the street traffic of London, the Highways Committee of the London County Council have been considering what course they should pursue. In a report which they will shortly present to the

Council they state that upon full consideration of the circumstances they have come to the conclusion that as regards six places only it is expedient that powers should be sought by the Council for the removal of the obstruction. They accordingly recommend that powers should be sought in the next session of Parliament for the removal of the bar in Brunswick-square, Camberwell, the toll-gate in College-road, Camberwell, the gate in Duncan-terrace, Islington, the gate in Nelson-square, Blackfriars-road, the gates in Montague-place, Tooley-street, and the walls in Caesar-street, Shoreditch.

THE arrangements for the summer meeting in Bristol of the National Association of Master Builders are approaching completion. The Mayor, High Sheriff, and President of the Chamber of Commerce have promised to give the delegates an official welcome to the city about mid-day on July 20. This will be followed by a meeting of the council of the Association and a general meeting of members; and in the evening the delegates will be entertained at a banquet at the Victoria Rooms by the Bristol Association. On the following day, by invitation of the president and members of the Bristol Association, there will be an excursion to Chepstow and Tintern *via* the Severn Tunnel. On July 22 the Bath Association have invited the delegates to visit that city.

A SALE of estates with which the Liberator Building Society was connected will take place at Winchester House on Wednesday, July 7, at two o'clock. The value of the estates to be sold is upwards of £250,000, and this represents the principal part of the remaining estates associated with the failure of the Balfour group. The estates are situated at Romford, Chingford, Norbury, Tilbury, and Clapham. One of these is Gidea Hall, which lies along the main road to Ipswich, at the eastern extremity of Romford town. The second property to be offered to auction is the Chingford-rise estate. This estate comprises 27 freehold villas, detached and semi-detached, all of which are let and produce over £1,500 per annum. When fully developed, the building land will give a total building frontage of over 25,000ft. The Clapham Park estate comprises three mansions, each standing in timbered grounds, with lodges, stabling, gardens, &c., in all about 43 acres. The Tilbury Dock estate, which is another of the properties, was laid out at the time of the formation of the Tilbury Docks, a large number of small houses being built for the accommodation of dock and riverside labourers. There are 349 houses and shops, and 26 acres of building land partly developed and available for building houses. The remaining estate is that at Norbury Park, near Croydon. This property forms the outlying portion of the estate occupied by John Hobbs, whose residence, Norbury Hall, with its adjoining grounds, occupies the central portion. The estate extends over 68 acres. The auctioneers are Messrs. Douglas Young and Co.

It has long been a matter of wonder on what principle the architectural drawings shown at the Academy year after year are selected, and it would seem that the pictures are judged more by size than excellence. According to the "Debats," amongst the pictures submitted for approval to them was a landscape by M. Harpignies. It was rejected as, apparently, not good enough for Burlington House. But the Hanging Committee have recently learnt that M. Harpignies has obtained, at the Salon of the Champs Elysées the Medal of Honour—or, in other words, one of the highest distinctions that artists in France can hope to acquire! As a matter of fact, M. Harpignies is a veteran painter nearly seventy years of age, well known and appreciated in France. It hardly says much for the Hanging Committee's knowledge of foreign art that the work of a man so celebrated in his country should have met with the scurvy treatment vouchsafed to a humble dauber. But they seem to have acted in sheer ignorance, and probably never carefully inspected the picture sent to them.

ONE of the new occupations of women, for which they are said to manifest a peculiar aptitude, is that of the sign-painter. Every observant passer-by in the streets of Berlin, says the *Industrielles Echo*, cannot fail to notice the number of women who are now busy at this branch of work. The ladies, like their male colleagues, have adopted a loose grey linen blouse for protection from the droppings of the paint-brush, and they adorn their heads with a neat

hood. The employers speak very warmly of the excellence of the women's work, which is not confined to merely letter-painting, but extends to the more decorative branches of the sign-painter's art. For sign-painting, in the mediæval cities of Germany, was certainly an art of a very high quality, and there is no reason why it should not become as exquisite and flourishing as it was of old. An increasing part of the interior decoration of rooms and shops is now confided to the women-painters, whose quick sense for beauty of form and colour expressly fits them for such work.

From Washington we hear that Supervising Architect Aiken has resigned his post, and Secretary Gage, it is said, proposes to fill the vacancy by a competitive examination conducted by the Civil Service Commission. A committee of architects will assist. In this way the general and technical skill of the candidates is to be determined. But how the administrative ability of the candidate is to be tested by examination it is certainly difficult to say. Art and administrative qualifications cannot be gauged in this manner.

The erection of public buildings in the Treasury Department of Washington, U.S., is to be open to general competition. Secretary Gage has consulted a number of prominent architects, and has found a willingness on their part to assist him in putting the Treasury law into effect. Architects are to be invited to compete for plans and specifications for the next Government building to be erected, and Congress will be asked to reimburse the unsuccessful architects for the actual expenses they are put to.

The adjournment of the debate on the report stage of the Plumbers' Registration Bill leaves that measure the first order for next Wednesday (the only day left open to private members for the remainder of the session), but even if the amendments relating to it which still stand on the paper should be disposed of, there is not likely to be enough time afterwards to enable the Bill to become law this session.

MR. ALEX. KOCH has just issued his yearly little volume of reproductions done to a concise scale of several of the architectural drawings shown at the Royal Academy, and to these he adds selections from other galleries, and a series of Continental buildings from photographs and drawings, making an entertaining collection, in which the British work shows to great advantage. As we have given in our own pages many of the subjects in our selection of illustrations from the Royal Academy, there is no occasion to individually particularise these smaller copies, which, however, are capitally rendered, and make a gathering for ready reference. This is enhanced by some photo-prints of sculpture, English and foreign, while several plans are added of the buildings represented. Several of the usual contributors are conspicuous by their absence, but this is due to their not being represented at the Academy this season.

"AMONGST the many Jubilee gifts," says the *Western Daily News*, "probably none gave greater all-round pleasure than did the only two received by the Little Sisters of the Poor at Hartley, on the outskirts of Plymouth. They were strikingly different in character, but each delighted the good mother and her fifteen Little Sisters, as well as the three or four score broken-down old fossils—men and women after their kind—whom the good sisters so tenderly care for and 'do' for in their beautiful home on the heights beyond Manna-mead. The one was a case of prime old Scotch whiskey, accompanied by a request that on Jubilee Day every venerable grand-fer and every grand-dam might drink to her Majesty's jolly good health. The other was an exquisitely-carved oak crucifix to stand upon the Tabernacle in the Sisters' Chapel. The cross stands upon three steps; said to represent the three cardinal graces of Faith, Hope, and Charity—known as a Cross of Calvary. The cross and figure are from the studios of Messrs. Harry Hems and Sons, Exeter."

SUPPORTERS of the movement in favour of the construction of a tunnel between Scotland and Ireland are greatly disappointed by the answer given by the President of the Board of Trade to the deputation who waited on him on Tuesday. But though disappointed, the supporters of the movement are not discouraged. On the contrary, they are determined to agitate until they get behind them such a force of popular opinion as

will compel the Government to give them some help. Certainly the paltry £1,500 asked for towards the expense of making borings might have been more graciously refused by Mr. Ritchie.

THE new American tariff law will have an important effect upon building interests, and American architects and contractors, as well as owners, are ruefully studying the debates of Congress. At present, the prospect is that the new law will nearly double the price of plate-glass, by imposing a duty of 80 per cent., in place of the present rate of 25 per cent.; lumber will rise about 10 per cent., as a consequence of the imposition of a duty of 2d. per thousand, and manufactures of lumber will rise still more, through the protective duty which is to be laid upon them; hardware, nails, and screws will also receive a protective duty, and plumbers' pottery will be greatly enhanced in price, for the same reason.

ON Wednesday the old-established and well-known business of the St. Pancras Ironworks was converted into a limited liability company under the style of the St. Pancras Ironwork Company, Limited. All the shares are held by the present partners, who become managing directors, and no change will be made in the system of carrying on the business, established in 1849 by the former proprietors, Messrs. Cottam and Cottam; nor, we are sure, in the measure of success so deservedly achieved and steadily maintained.

Trade News.

WAGES MOVEMENTS.

LEEDS JOINERS.—The master builders of Leeds have received notice from the Joiners' Society that the members of the latter organisation will henceforward decline to fix machine-made woodwork which has not been produced under what are regarded as fair conditions of labour. It is supposed that this is chiefly directed against a local firm with which the unionists had a dispute. It is felt that the decision places masters in an awkward position, inasmuch as they do not always know the conditions under which such material in their hands has been produced.

IPSWICH BUILDING TRADE DISPUTE.—The principle of arbitration has been accepted by both parties to the dispute in the Ipswich building trade; but some preliminary difficulties have arisen, and the men have not yet returned to work. We understand, however, that the men make two principal requests—firstly, that a day shall be fixed for the arbitration, so that it may not be kept hanging back for an indefinite period, and, secondly, that the men shall go to work under their own rules pending the result of arbitration.

At a meeting of the Leamington Parish Church Completion Committee, on Monday, a report was read from the architect, which included estimates for the contemplated completion of the fabric. The first estimate of £3,757 was for the whole extension up to the sills of the aisle windows. The second estimate, which comprised the whole extension complete, amounted to £10,768, with £486 extra for roof in oak. A further estimate for the completion of the tower amounted to £3,800. It was directed that a contract for the first-mentioned scheme should be obtained from Messrs. Smith and Sons, Milverton, at a cost not exceeding £3,750. The funds received and promised amount to £4,750, £2,000 of which will be required for repairs to the present building.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2218.

FRIDAY, JULY 9, 1897.

REASONABLE SUPERVISION.

FEW questions give rise to more doubt than the liability of the architect for buildings erected under his supervision. We generally like to trace back such questions, and endeavour to find out what the custom and tradition have been. In Mediæval times, when the architect was master builder or craftsman and superintended the execution of his own design, and was exclusively engaged on it, there can be no doubt his responsibility was continuous with his appointment, and was much more onerous than it is now. But the profession has vastly changed since those times: the modern architect's sphere is more limited, and chiefly consists in making designs and directing the execution of the work. The builder or contractor undertakes to carry out the building according to the designs and specifications furnished to him, and to make himself responsible for the performance of the work. According to this division of duties, the architect's chief responsibility appears to be that of preparing a skilful design that can be practically carried into effect—to use that amount of reasonable care and judgment that may be necessary in the preparation of working drawings and details, and in the specification. If this is a just view of the case—and we think it is—the architect's liability is limited to questions of construction, strength of parts to bear the weight and stress of various forces, the specification of proper materials, and further, to such skill in design and artistic arrangements as may be considered reasonable and necessary. All matters of actual execution necessary to carry out these intentions appear to belong to the builder as contractor. The first is required to bring art and skill; the second, management and mechanical skill in execution, and superintending the workmen employed, in finding proper labour and material. We can understand such a division of duty, and of the responsibilities attached to each, as they seem to be the natural result of the modern system of architectural practice. If the architect is no longer required to give his whole time to one building, and to superintend the laying of every brick and stone and the framing of every timber, it is no longer expected of him that he should become liable for any default in these matters. The one seems to follow the other. Strange to say, however, this distinction is not so clearly recognised in practice. The architect is expected to look after the work done by the builder, and to make himself responsible for a great deal that is done wrongly or that shows any serious defect. Legal tribunals have occasionally held the architect liable for defective materials and bad workmanship. In lawyers' phrase, there is an "implied warranty" on the architect's part that he is reasonably competent in the discharge of his functions, and if by neglect in superintendence bad material is used, or the owner derives no benefit, from any cause or defect in the building, the architect is held liable. By the French law the architect, as well as the builder, is held liable for negligent construction. Take the case of foundations. Is the architect liable for their failure or cracking of the walls? In one instance, "*Schreiner v. Miller*," 1885, he was held liable for his want of skill and care in not examining the foundations, and had to pay damages. A legal authority writes: "The fact that the builder is liable under an entire

contract for making proper foundations will not lessen the liability of the architect for neglect to examine them, and the employer has a double remedy, and can sue either builder or architect, or both together."

The main question which concerns the profession is, What is reasonable in the way of supervision? Although not expressed in so many words, those who write textbooks are careful not to define this point very clearly. The Courts only deal with actual cases before them, and if anyone reads over the rulings of some judges carefully, he finds very little to help him on the subject of superintendence. Juries know little of the details of the work or circumstances which often render it impossible for the professional man to give the attention necessary. We have the dicta of judges that an architect is not compelled to make a personal examination in every case, but is liable if he uses incorrect data. A general opinion among those who administer the law is that the professional duty of the architect is to examine and test by his own knowledge, statements or plans made by others upon the work in which he is engaged. Thus, if he is about to build an addition to an old building by raising it a story or more, he is held liable for any neglect to sound the walls or test the foundations. But we will suppose the building is miles away, a long railway journey, or the architect has other more pressing work to do, is he to be held liable for not testing the masonry or the soil, if any mishap or settlement takes place? He has given sections of the foundations founded on data; his walls and counterparts are thick enough, and the specification provides every precaution as to shoring, underpinning, and every care in the execution. The builder is held responsible for any negligence or the employment of inefficient methods. According to the above dictum, the liability will rest partly, at least, with the architect for not making a personal examination. And yet it seems no part of his special duty, which is to supply plans and specifications. Or take another case. An architect has to build or restore an edifice, and to make an estimate of the cost. For this purpose he takes general observation of the subsoil with which he is satisfied, and begins to prepare his sections. He does not discover the existence of a spring or bed of sand in one part till the trenches are dug out, and he thereupon incurs increased expense in pile-work, pumping, and shoring—greater depth is necessary, and the cost comes to far more than the owners expected. Now, this is quite as hard a case as the other. How is it possible for a professional man to excavate trial pits in every part, or to divine there is a spring or a bed of sand or peat? Notwithstanding this, in "*Moneypenny v. Hartland*," it was held that the architect could not recover his charges. According to this principle, the architect is supposed to be constantly on the works—an unreasonable supposition.

If we apply this principle to an architect's liability for any defects that may appear in any building carried out under his superintendence, it will appear that he would be responsible for a great many things—for every item, in fact, provided in the specification, which amounts practically to this, that he must not only specify everything necessary, but see that it is carried out. And this appears to be the prevailing opinion of the many. They think, when they engage an architect, he will see to everything; even the laying and jointing of drains, the preparation and laying of concrete; that he is responsible for every brick that goes into the building. But how is it possible for him to do so? An architect has his office miles distant from the building. Is it possible for him to see how the concrete has been mixed and laid in the trench, or the quantity of bad bricks that go into the wall? Or he is absent some days, and in

the mean time some work is done that turns out defective. We are supposing there is no clerk of works. A correspondent the other day asked, "What is the actual extent to which an architect may be held responsible for any defects in a building carried out under his superintendence?" As he very justly said, some clients imagine that an architect is responsible "for every nail driven and every brick laid," and he gave a case in his own experience. An architect is absent, the contractor takes advantage of this absence by hurrying on the plasterwork. For this purpose he leaves all the windows open on the hottest summer day, with a wind driving through the building. The first coat of ceiling is dried in 24 hours. Some time afterwards a part of the ceiling falls; the rapid drying had taken the "nature" out of the lime. Is the architect responsible?

To take a few trades which often bring upon the architect much vexation and trouble. What workman requires more watchful attention than the bricklayer? Some specify a number of requirements which they cannot possibly see carried out, like "flushing up" joints with mortar or "grouting" every few courses. Unless someone looks after it, the vertical joints are never filled with mortar. Wetting the bricks before use is another requirement absolutely necessary in dry weather. Who looks after it? The architect cannot. Quite as important is the provision that "headers" are not to be snapped. In face work there is a strong temptation to do this, as it saves facing-bricks. Selecting facing-bricks demands particular and close attention. In the absence of the architect, even for a day or two, some rods of porous and badly-burnt bricks can be put in; the particular kind of brick of the right thickness may be dispensed with. But is the architect to watch and see if every course of facing-bricks is of the same thickness as the backing, or that facing and backing are properly bonded together? Supervision may often be remiss in the matter of pointing brickwork. It is often specified that the work is to be pointed as it proceeds: is it expected the architect can be always on the alert to see if it is done? An owner blames him if the pointing crumbles and falls out of the joints during the first winter, because the builder has not done the pointing as specified, but after the completion of the work. Allied to "pointing" is the dishonest practice of colouring, and making brickwork look uniform in tint, by rubbing down and filling in with putty or cement cracks and inequalities. All these disguises soon disappear and leave behind a rough thick-jointed wall for which the architect is blamed. Is he responsible? Take again, slates. How is it possible for an architect to see that he gets exactly the slates specified; that they ring when struck, are of the right kind and colour? or see that the artistic qualities of variety in tint, &c., are obtained? It would be simply impossible to expect the five per cent. professional, with other work to look after, to do so. In plastering and painting there are numerous ways and means of ignoring specifications, in using inferior materials and pigments, which it would be extremely difficult for the architect to find out, unless he is a technical expert in those trades. So in the qualities of glass and the modes of glazing. Thin glass is often put in, despite the specification formula about ounces to the foot super., or thickness in fractions of an inch, or the mode of fixing. The windows let in the rain. How is it? The contractor says they have been properly made and glazed. This may be because the glass has not been properly puttied in the rebates, the sheets of glass have not been "back puttied," and the architect is held responsible. Other items on which the blame is laid to him will occur to

all practical readers. The same question arises in each. How far is the architect liable for his personal negligence in not seeing that what he has specified is carried out? Advisedly we say he cannot reasonably be held liable for any of these matters if he has specified them properly, and has visited the works at regular intervals. The frequency of his visits must depend on distance, importance of the building, and other circumstances. When there is a clerk of works, of course, his visits may be much less frequent. But the law and the ordinary client will hold him responsible, all the same, for many of these things, and it will be for him to prove that his personal supervision has been as frequent and thorough as the case demanded. At the present moment, one popular notion of the architect's value is that he is a superior builder, and that, by his appointment, everything will go right—an opinion which is, after all, a sound one as far as it goes. Were people to think otherwise, the professional architect would have still less to do than he has already. For a great many already think his duties and functions are ornamental and superfluous, and that his engagement, instead of meaning a better designed and constructed building, means the addition of a percentage which is of doubtful value in the result.

AN EXPANDED-METAL FLOOR.

THE strength of expanded metal floor construction has been the subject of a series of tests, some of which we have reported. These tests have been conducted in New York among official lists of various types of fireproof construction under the Department of Building. In one case a floor 14ft. by 12ft. was built on three 4ft. panels supported by 10in. steel I-beams. On the top flanges were placed expanded metal of 3in. meshes horizontally, and covered with a 3in. layer of concrete, made of Atlas Portland cement, sand, and cinders, in the proportion of 1 part cement, 2 sand, and 4 parts cinder. This concrete imbedded the webs and lower flanges of beams. A 2in. filling of similar concrete, with twice as much cinder, was put on top of first bed, and the ceiling was plastered. The latter was exposed to a high temperature for five hours, and the fire was quenched by a hose stream, which removed the plaster and exposed the wire mesh. The plunger of the testing machine or hydraulic ram was applied through yellow pine blocks 12in. square. The pressure was applied at a uniform rate, and after a lapse of 3½ minutes a load of 12,500lb. was reached. After this, pressure was increased to 13,200lb., and then relieved, and again increased to 13,500lb., the maximum. The pressure was again relieved until 10,800lb. was registered, and after increased to 12,000lb., at which a continuous failure of the arch took place. The strength seemed to vary up and down, and there was an intimate contact between the concrete and the expanded metal. Each time the arch was relieved of pressure it recovered some strength, and at 5,400lb. cracks appeared on the underside of slab. At 6,000lb. the strands of wire mesh parted. This test has proved, according to the experiment made by Mr. George Hill, M.Am.Soc.C.E., whose figures we quote, the great strength of this form of floor construction, and the active part the expanded metal plays when covered with a layer of concrete and the steel beams protected.

THE PERILOUS CONDITION OF SOUTH KENSINGTON MUSEUM.

THE Select Committee of the House of Commons met again on Tuesday, Sir John Gorst, the chairman, presiding. The principal witness, Sir John Taylor, chief surveyor of the Board of Works, said that at South Kensington there were many old and some new temporary structures in close proximity to the galleries, which were of an extremely inflammable character. Most of them were erected prior to the year 1875, when the department took over their control. Besides these, there were in the Cromwell-road some old and dilapidated buildings of a very inflammable character, occupied

Fig. 126.

Fig. 127.

for residential and office purposes. These buildings had, he believed, been taken over with the land. The residences of the three chief officials had been built by the Department of Science and Art, but the houses in Cromwell-road were of the ordinary character, and had no pretensions to being fireproof. The whole of the temporary buildings should be removed as rapidly as possible. The danger of the buildings had been placed before them by Mr. Street, an expert, who had been called on to report on the question. Since then very little had been done to improve their condition. There was no practical difficulty in renewing the roofs and making them fireproof; the only question was one of cost. The buildings on the south side had no pretence to fireproof construction. The floors and the roofs were both of wood. If money were provided by the Treasury, the Office of Works could at once proceed with the rebuilding. The plans were in part ready, and the only question was as to the front. He thought it impossible to make the present temporary buildings safe. The only plan would be to pull them down and put up another building. The report of Mr. Street had told them nothing they did not know; but it would be of value if it had the effect of forcing the Government to do something. The designs for the new building had been selected five years ago, and part of the working drawings had been completed, but there was no money to carry them further. He advocated the rebuilding of the Museum as a whole, and not in departments, and thought it could be completed in five years. He suggested that during the rebuilding place could be found for part of the contents of the Museum in the Tate Gallery at Millbank, which was nearly ready. The committee then adjourned.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXIII.

THE limit to the economical use of the solid-plated, single-webbed girder, or the double or treble webbed box-girder is soon reached. Though the metal is massed heavily about the top and bottom flanges there is the objection that there is a great deal of material about the central web which is practically inert, taking little or no share of the stresses, while adding to the dead weight. The next advance, therefore, is to proportion the web in such a way that the metal shall be arranged in definite lines corresponding with the nature and intensity of the different stresses transmitted; thus are developed the many types of lattice or trussed girders embodying different kinds of triangulation, and which form a wide study in themselves. In these, every strut and every tie is proportioned according to the stress which it is calculated to bear, and lightness is gained without sacrificing strength. In the lattice-girder, too, very much more variation in design is possible than in the plate-girder, since the ties and struts may be composed of flats, or flats and angles, or tees, or channels, or other sections, while the top and bottom booms may be made of flats and angles, or flats and

tees, or channels in many combinations, examples of some of the principal of which will follow. The problems that arise in connection with the design of plate-girders do not, therefore, make so great demands on the technical and practical skill of the designer, as do those which are associated with the forms of the braced girders; in the latter there are so many combinations possible of the elements of which they are composed that it is often very difficult to make suitable selection. These supply a most interesting study of the building up of simple elements into forms more or less complicated to stand stresses of varying kinds. Economy of material, minimum of weight, strength, stiffness, each and all have to be considered at once in such designs. No hard and fast rule can be laid down, and very dissimilar therefore are the means by which similar ends are attained by different engineers.

The elements of any lattice-braced girder are

Fig. 128.

the booms, and the web-members comprising ties and struts. The principal among the various arrangements which are adopted in the building up of booms of braced girders must receive brief notice first; these arrangements depend on various conditions, chief of which is the dimensions of a girder. The group of figures, 126, illustrate several of the sections which occur most frequently, proceeding from the smaller and lighter to the larger and heavier. In this group of figures, 126, A is the simplest form of boom, consisting of a tee only, to the web of which the bracings, of bar or of angle, are riveted. This is suitable only for very light, shallow, and short girders. B is the next advance, in which a plate is riveted to the tee, giving higher moments of resistance, so that the boom offers better resistance both to vertical and lateral deflection; but these forms are only suitable for shallow or thin bracings, which can be riveted to the outside of the web. When it is desirable to place the bracings centrally, then

Fig. 129.

Fig. 133.

Fig. 134.

two angles may be riveted to a continuous web-plate, as in C, or gusset-plates may be riveted between the angles at intervals, as at D, for the attachment of the ties and struts. E is the same construction, but with a covering-plate added. When girders become wider and deeper, the angles are placed farther apart, as at F, the angles inclosing struts of H-section, or of various built-up sections; while the ties may be of the same width but of lighter section, or, alternatively, bar-ties may be used attached separately to each angle on opposite sides. G is a section of a boom for specially wide girders, in which the

angles. Short lengths of narrow covering plates *bb* riveted at intervals unite the flange-plates of the top boom, the angles on its lower edge being connected with transverse bars and diagonal bracing *e*. The inverted plan of the lattice bracing is seen in Fig. 129, and many of the largest booms are built up by these or by methods similar in principle. The difference in weight in solid flange-plates and bracings is considerable; bracings can be used in some sections only, and then bracings alternate with solid plated portions. The webs of the bottom boom in Fig. 128 are united with diaphragms, *d*, at intervals. Fig. 130 is an example of a boom built up with angles chiefly. The bars or stays, *aa*, are but a few inches wide, and riveted to the angles at intervals of 3ft. or 4ft. The bars *b* are

Fig. 130.

angles are placed far apart, and both struts and ties are riveted to each angle, the space about the centre being unoccupied except for cross or bracing ties, which frequently pass transversely in pairs. H is a stiffer section, in which deep web-plates are added, being riveted to the angles to receive the bracings, and to stiffen the boom depthwise. In the group Fig. 127, J is another form

Fig. 131.

in which the width of the plates renders desirable a stiffening in the form of internal angles. K is another type in which, in order to avoid the use of very wide and correspondingly short lengths of flange-plates, two separate booms are placed side by side, and the girders are connected with diaphragms or narrow plates. L is a form built of four angles connected with bars riveted upon the outside flat faces. Fig. 128 shows a top and bottom boom, each composed of a pair of flanged vertical webs. On one side, the top and bottom respectively of each, continuous narrow flange-plates *aa* are riveted to the webs with

similar; but at intervals gussets are riveted of the same thickness as *bb*, and riveted between the angles similarly to *bb*. In this construction, therefore, the angles only are continuous, and the place of the ordinary webs is taken by bars and gussets. Fig. 131 shows a boom section built of continuous plates united with angles, the sides being rendered rigid with diaphragms of plate and angle riveted between. The bracing is riveted outside in this example. Fig. 132 illustrates heavy top and bottom booms built of continuous plates, and stiffened with external angles in a rather elaborate fashion.

Frequently the edges of heavy booms have to be stiffened thus along the free edges; this is effected

Fig. 132.

variously, as by the riveting of angles or of flat bars along them. The arrangements for stiffening will be controlled partly by the conditions imposed by the forms and nature of attachment of the bracings, partly by the extent of the stress in any given sections. The type and section of longitudinal stiffening may therefore vary in certain cases in different localities of the same boom; but, from the point of view of simplicity of construction, uniformity of section is usually desirable. Fig. 133 illustrates various methods of stiffening and strengthening both the edges of vertical webs and of flange-plates.

In Fig. 132 the super-position of flange-plates is shown. In order to proportion the various parts of boom flanges to the strains which they have to bear, the thickness often must be increased about the centre, diminishing to the ends. Fig. 134 is a diagram of flange-plates, showing the end-joints of the several plates of which it is composed; in a developed drawing of this kind the thicknesses are exaggerated in order to show the separate plates and joints. The utility of thin plates in the building up of flanges is clear; in a long girder the discontinuity of any single thickness is scarcely noticeable, so little does the general curve depart from the parabolic outline which coincides with the load. The several stresses on the booms are calculated from the maximum to the minimum, and the plates are cut to length to give the strength required in the several localities and joint-plates added where required. There are fewer joint-plates on a boom built up thus than in one the flange of which is composed of a single plate only, because some of the plates act as joint-plates to others on which they are super-imposed.

In these figures the metal is for the most part massed about the outer sections where it is arranged to the best advantage; in other words, the moment of resistance is high. Except in the plainer sections in Fig. 126, no metal occurs in the neutral axis. In nearly every case the flanges are wider than the distance over the webs, and continuous webs project beyond the angles.

J. H.

NATURAL WOOD FINISH.

THE growing scarcity of the first quality of white pine lumber suitable for house finishing has made this wood actually more expensive than oak or some of the other so-called hard woods. For this reason, and because householders generally seem to prefer it, the use of hard wood trim has become more and more general. One reason is that natural finish is easier kept clean, and does not show finger-marks like the old-fashioned flat white paint. This of itself is sufficient to commend it to the careful housewife. It was what made graining so popular in the days when hardwoods were articles of luxury, and it was the custom to grain the dining-room, the bathroom, and some of the other most used apartments. Alas, for the grainer, oak became cheap enough for everyone to use—the real wood actually costs less than white pine grained to imitate oak. Hardwood finish has come to stay, and it has driven much profitable business in the way of interior repainting away from the master painters.

The two most essential things to a good job of natural wood finishing are good workmanship and the right materials—materials specially adapted to the work in hand. The day was when this kind of work was but imperfectly understood by the house painter, and one kind of varnish was supposed to answer a multitude of purposes. In those days the painters and architects alike pinned their faith to English coach-body varnish for outside work, and to shellac for interior finish, without regard to the special wood that has to be treated.

To-day we have house varnishes for exterior and for interior work, for floors, for use over enamel finish. In addition to these we have the so-called hard-oil finishes—only another name for a special class of varnishes—and the liquid fillers or first coatings. Carriage varnishes have been practically driven out of use for house painting, since they are not so well adapted as the specially made varnishes for obtaining the results desired, and though a good carriage costs more money to make than a house varnish, it will not give as satisfactory or durable a finish under the conditions to which it is subjected in the ordinary dwelling-house.

When hardwood finish was first introduced—or, rather, we should say, when natural finishes

first became popular—it was the custom to employ shellac as a first coating. The expense of shellac led some of the manufacturers to experiment, until, finally, liquid-fillers or first-coatings were put on the market for use on white pine and other close-grained woods, which have proved in every way as satisfactory as shellac, and at the same time are easier to manipulate. The general nature of these fillers is well understood, and the painter who chooses to do so can make them for himself, perhaps with an apparent saving of money; but much of this shop-made filler is of little or no value, and it is more economical in the end to buy the factory-made product, because, being made by machinery in large quantities, the silex and other ingredients of which they are compounded are much more thoroughly and intimately mixed, and more uniform in their quality than can possibly be obtained by stirring these materials together with a paddle.

The first thing essential in a good job of natural finishing is that the wood must be clean, smooth, and free from dust. All pencil-marks must be sandpapered off, and all the rough edges and surfaces left by the carpenters must be carefully smoothed down.

If the wood is coarse and open-grained, such as oak, ash, chestnut, or mahogany, it must be given a coat of paste-filler, which should match the wood in colour as near as possible. When antique or other coloured finishes are desired, such as the forest green, now so popular with oak, the colouring matter must be added to the filler to produce the tint required. The filler is mixed with turpentine to the proper working consistency. One or two hours after the filler is applied it should be wiped off with tow, as this fibre has less tendency to pull the filler out of the pores of the wood than burlap or some other substances. In about 24 hours, or when the filler has become perfectly hard, the surface may be rubbed down with fine sandpaper, and then dusted off thoroughly preparatory to applying the first coat of varnish.

There is a little oil in paste-filler, which tends to darken the wood, so if it be desirable to retain the original colour of a light wood, instead of filling it, as just described, it should be given a coat of white grain alcohol shellac varnish, which fills the pores, and, as it contains no oil, does not stain the wood. But, unless it is particularly desirable to keep the wood very light, it is not advisable to use shellac on any wood except pine, as the varnish put on over it is very apt to scale and chip off. On yellow pine shellac must be used to kill the sap.

Close-grained woods, which include white pine, poplar or whitewood, cherry, birch, maple, sycamore, gum, and hemlock, need no filling, but require surfacing. Having no cellular tissue to fill up, it is merely required that the surface be sealed up, so that it will not suck the oil out of the varnish.

For this purpose either shellac may be used or a good liquid filler. A liquid filler of the right quality will cost less than shellac, hold out the varnish and assist it to retain its brilliancy, will dry flat and require little or no sandpapering.

The wood having been properly prepared and thoroughly freed from dust it should be given two coats of varnish, which will suffice for the better grade of dwelling-house work if a good quality of varnish is used. Three or more coats are applied in the finest grade of work, the effect being to aid a certain quality to the finish known as depth or fulness. The painter may save himself much worry and expense if he will use only such varnishes as are made by reliable manufacturers, and are adapted to the particular work under way. Many of the troubles that arise in using varnish are not due to inferior material, but to carelessness in the application of the varnish, or to the use of a varnish not adapted to the requirements of the case.

Proper light and ventilation are absolutely necessary to facilitate the proper drying and hardening of varnish. Applied in damp buildings, or in buildings that are not properly heated in cold weather, the drying and hardening will be materially retarded. Extremely hot weather will also keep varnish soft for some time. Each coat of varnish should be allowed to become thoroughly dry and hard before the subsequent coat is applied. All but the last coat should be rubbed with curled hair to cut the gloss, as, in order to produce a high gloss finish, the under coats must always be dead. If a high lustre is wanted, the last coat should be flowed on liberally.

If a partial gloss or 'egg-shell' finish is desired, rub the finish coat with fine powdered pumice-stone and rubbing-oil, wiping off clean and dry with a soft woollen rag. To produce a "dull finish," somewhat more dead than the eggshell, use water and pulverised pumice-stone for rubbing.

A polish finish is obtained by first rubbing with pumice stone and water and then with pulverised rottenstone or water, or furniture polish, and wiping off with a dry cloth.—*Hardwood.*

THE SEPTIC TANK SYSTEM OF SEWAGE DISPOSAL.

THE application of the remarkable discovery made by Mr. Donald Cameron, city surveyor of Exeter, is seen in the "Septic Tank System of Sewage Treatment," an installation of which writes Mr. Robert Anstey in the *Western Daily Press*, by the courtesy of Mr. F. J. Commin, F.S.I., I recently visited. It is situated about half a mile from the Cathedral-square, in a meadow adjoining the river Exe. There is little to indicate that anything unusual is taking place. In one corner of the field the eye catches a grass-covered mound, with some lines of masonry standing a few inches above the level of the meadow—the whole being inclosed by an iron paling. There are no buildings, no noisy machinery, no besmirched attendants. The cattle are grazing quietly a few feet from the mound. The fresh green trees are vocal with the song of birds, and in pleasing harmony the hum of city traffic mingles with the murmur of the weir. Closer inspection shows the mound to be a partially submerged tank formed of masonry and cemented on the inside. It measures 64ft. by 18ft., with a depth varying from 7ft. to 10ft., and deals with the sewage from a district containing about 2,000 inhabitants, its capacity of 55,000 gallons representing an average daily supply. Through a man-hole on the outside of the septic tank the raw sewage can be seen arriving at this point. There is a coarse grating to keep back large pieces of stone, wood, &c. Here the flow is divided, and enters the tank by two inlets placed near the bottom. Below each inlet there is a grit chamber for the reception of road gravel brought down by storm water. At the opposite end there is the outflow, a 9in. pipe placed transversely, projecting into the tank about 16in. below the sewage surface, closed at the end, but having a slot running its entire length. This arrangement of inlet and outflow insures a comparative absence of movement. Upon entering the still waters of the tank the solids present in the sewage, to a large extent, rise either to the top or sink to the bottom, forming at the bottom a thin layer of dark earthy matter, and at the top a somewhat solid scum from 3in. to 4in. in thickness. Light and air are, as far as possible, excluded. Under these favourable conditions, the micro-organisms or bacteria present in the raw sewage increase enormously, feed upon the solids, and excrete the same in a new and liquid form, the final results of this decomposition in the tank being the disappearance of the solids and the formation of ammonia, carbonic acid, marsh and other gases. The installation has been in operation since August last. Into the septic tank there has been flowing without a moment's intermission the sewage from a tenth of the inhabitants of Exeter. During that time nothing whatever has been added, and nothing whatever taken out, the solids having been decomposed by the growing bacteria. I entered the tank by means of an inspection well, placed in the centre, having a series of windows. At the bottom there is a settlement of about 3in. of earthy matter, and at the top a scum of from 3in. to 4in., neither having materially increased during the past four months; in fact, it would appear from the examination of another tank that had been in use for thirteen months, that it could be used for an indefinite period without requiring to be cleaned.

The question will naturally arise: What of the gases that must be evolved by the decomposing sewage? All analyses by Dr. Rideal of those present between the surface of the sewage and the roof of the tank show that they are composed of hydrogen—carbonic acid, nitrogen, and marsh gas—with an entire absence of oxygen. At the time of my visit the tank had not been opened for some days. Upon lifting the covering of the man-hole a slight, but not very objectionable, odour was perceptible, and Mr. Commin assured me that he never felt anything objectionable when standing

outside the paling that inclosed the tank and filters. This statement receives negative confirmation from the fact that no complaint has been made by any of the residents in the neighbourhood.

The houses are of the better class. One, standing in its own grounds, on the same level, is not more than 50 yards distant. The dissolved sewage, or effluent, as it flows from the tank, is slightly discoloured, and gives off a faint odour, and, like the air of the tank, is deficient in oxygen. It falls first into an iron trough, over the sides of which it flows in thin smooth sheets. It will be seen that this arrangement of discharge brings a large surface into contact with the atmosphere, from which it freely absorbs oxygen. This dissolved oxygen is of vital importance in the second, or filtering, stage. The filter-beds are five in number, and are formed of open, submerged tanks, each having a surface area of 80 square yards, with a depth of 5ft. Four are filled with crushed furnace clinker and one with crushed coke. Four are used in a cycle for a week, thus giving the fifth a week's rest. By an automatic gear (difficult to describe without drawings) the filters are filled and discharged without any attention from the attendant; in fact, all the manual labour required is an occasional oiling, and the alteration of the gear once a week in order that each filter in its turn may get a rest. This can be done by one man in an hour and a half. Supposing No. 1 filter is being filled, directly the liquid reaches within a few inches of the top the automatic gear cuts off the inflow and turns it on to No. 2. While this is filling, the liquid remains in No. 1. When No. 2 is full, the inflow is stopped, and turned on to No. 3, and at the same time the discharge-valve of No. 1 is opened. The filtered sewage or filtrate rushes out to the river. At the first rush the filtrate is very faintly discoloured, but a few minutes later it has a beautiful crystal clearness, and a flavour by no means unpalatable. An analysis of the filtrate shows that it contains nearly five times less of organic nitrogen than the 0.3 parts per 100,000, the amount suggested by the River's Pollution Commission as being permissible—a standard of purity not often attained by other systems of treatment. It is important to note that the changes that take place in the filter-beds are not the result of a straining process, but are due to the presence and growth of bacteria. These are of a different kind to those that broke down the solids in the septic tank. Were it otherwise, the filter-beds would soon become foul and useless. I took some of the crushed clinker from a few inches below the surface, and found it smelt very little different to ordinary garden mould, and this after nine months' constant use.

Scientists have for some time been aware of the fact that micro-organisms are killed by the results of the chemical changes they have themselves produced, and that the condition which is fatal to the family that produced it is a favourable one for the growth and increase of a near relation. In this fact we have a partial explanation of the changes I have attempted to describe. An important question will naturally suggest itself: What effect has this system upon the pathogenic, or disease-producing, germs? If in both stages favourable conditions are set up for the growth and development of bacteria, is there not a danger of retaining the disease germs alive, and also of greatly increasing their number? Without giving the technical data upon which the conclusion is based, it may be stated with emphasis, upon the authority of several eminent specialists, that "the chances of microbes surviving the passage through the filters are infinitesimal."

The system has now passed the experimental stage. At the instance of the city council it has been subjected to most exacting tests by chemical and bacteriological experts, and has come through the ordeal in a manner that must be gratifying alike to Mr. Cameron and the people of Exeter. Upon the expert reports the council have decided to lay down a plant for dealing with the whole of the sewage of the cathedral city. In comparison with the system of chemical precipitation, now in vogue at most sewage farms, the tank system has many distinct advantages. A few may be mentioned: Smaller initial outlay, working expenses practically nil, ability to cope with any sudden increase of sewage, no troublesome sludge, no depreciation of property in the vicinity, and results quite equal to any, and far better than most, other systems of treatment. Exeter was one of the first English cities to construct sewers, and it seems fitting that it should be the scene

A NORTH GERMAN CABINET OF DARK WOOD.

of the first application of a discovery that bids fair to solve the great question of sewage disposal.

NORTH GERMAN CABINET.

THIS Cabinet is full of curious and elaborate carving containing many small figures. The two panels of doors are intricately moulded, as also are the two drawer-fronts. This being a type of cabinet-making not often seen in this country, it is well worthy of study. The total width is about 9ft., and the height is about 7ft. 3in., and it is solidly made in dark walnut.

THE SCIENCE OF BRICKMAKING.*

THIS is a reproduction in a handy book-form of a series of articles that appeared in the *British Clayworker* last year, which has been published by permission of the proprietor of that journal. Mr. George F. Harris, the author, treats his subject in an elementary manner, and the book will be of value to brickmakers and clayworkers. Mr. Harris begins his subject in an interesting way by telling us of the characteristics of brick-earths as found near Erith or Ilford, in Essex; their fluvial origin; the remains of extinct animals found in the brick-earths of the Thames Valley; the flint implements, and shells, the evidence of which points to a river-channel or fresh-water origin. It is supposed the brick-earths of Kent and Essex accumulated in the river-channel were raised partly by a natural upheaval, partly by the channel becoming deepened by natural means, the mollusca and other fresh-water remains finding their way thither by being washed down by rivulets or by floods. All these facts are explainable by geology, and show how certain brick-earths in the Thames Valley are of fresh-water origin. Mr. Harris shows the practical bearing of these geological considerations, and he lays down some important rules for the guidance of the brickmaker. These deposits are, of course, not very deep, and they very in character horizontally. We advise all brickmakers and others to read this opening chapter. The mineral constituents of brick-earths are next considered—such as alumina, lime, iron, &c. The size of the granules composing the earth and the way the silica is combined chemically. The author observes the chemical composition of a brick-earth does not give an accurate idea of the possible active agents in the brick earth being subjected to the kiln.

These agents are, to a large extent, imprisoned in the mineral grains, and do not become involved in the partial melting of the mass. The author says "In many instances the value of a brick depends almost entirely on incapacity for fusion on the part of a large proportion of the minerals of which the brick is made. Possibly a good all-round brick would be where the bulk of its mineral particles were infusible at the temperature employed, and where the remainder were fusible enough to partially run, so as to cement or agglutinate the infusible particles firmly together." To this end we must know

(1) the nature of the mineral particles involved in the whole operation; (2) their behaviour under high temperatures; and (3) a knowledge of certain branches of metallurgical chemistry. Chemical analysis, Mr. Harris shows, is only useful up to a certain point, beyond which we must appeal to the microscope to aid us. The behaviour of mineral earths when under a high temperature is also necessary to be known. Describing the principal minerals found in clays used in brickmaking, such as kaolin or pure clay and felspar, the silica group, quartz, mica, iron, &c., the author goes on to deal with the chemistry of brick-earths. Little value can be attached to the analysis of brick-earths made by brickmakers without some knowledge of this subject. The author introduces his readers to some useful and easy methods of examining earths by the blowpipe, which gives a useful insight into the chemical constitution of these earths. Some earths, however, do not submit themselves to this test. The blowpipe only gives a qualitative, and not a quantitative analysis. So, also, the microscope is powerless to reveal the amorphous elements in earths. The blowpipe is, as our author says, handy, and can be carried about by the prospector. He can discover in a few minutes whether a white earth is a good china clay; whether an undesirable element like fluorine is present, or iron. The use of the blowpipe and its outfit are described. Later chapters deal with drying and burning, and durability. The author gives some useful information under drying, and the "doctoring" of raw earths to prevent cracking like sand, clay, lime, each of which ingredients may be useful for a certain class of brick-earth; but what may prevent cracking, will be bad in the burning. If care is exercised in the drying, cracking is not likely to take place: it is often due to the wetness of the earth. Of course, for clayey earths, the addition of sand or brickdust is useful; but it should be well incorporated before being placed under the press, and ground very fine. Again, the author refers to another cause of cracks in the indentations made by stamping the maker's name or trade mark on the bricks.

Under the head of the "Micro-structure of Bricks," the author alludes to the use of the microscope, by which the structure and homogeneity of the brick after burning can be examined. It enables one to detect things which the chemist cannot, what has taken place in the burning; the deleterious constituents are detected at their work, the small underburnt ingredients, semi-vitrified matter. Useful information is given as to the kind of instrument and its adjuncts. Few treatises give so much general and useful information of the nature and property of brick earths, their chemical constituents, and the mode of testing the qualities of good bricks. As a handbook on the physical properties of brick-earths and brickmaking it will be found very useful.

A BOAT BUILT OF IRON AND CEMENT.

ALTHOUGH we have been for some time prepared, partly from articles published in the *Building News*, and partly from perusing others, to anticipate a considerable extension of the present application of metal and concrete or cement to constructive purposes, we scarcely expected it would assume the form it has done. A brief description of this novel craft will, however, suffice to demonstrate that no insuperable "engineering difficulties" are entailed in the building of it, and that there are no details in its construction which are in the slightest degree likely to tax one's credulity. The ribs or framework of this Italian bark, for it hails from classic shores, consist of round wrought iron bars, about $\frac{1}{2}$ in. in diameter. When these are fixed in place, they form a complete skeleton, which is covered and protected by a close network of iron, with meshes $\frac{1}{4}$ in. wide, and securely fastened to it with metal clips. The network is subsequently coated both on the inside as well as on the outside with layers of concrete composed of pure cement, mixed with a given proportion of sand. Presumably the number of coating layers necessary, or the total thickness of the concrete skin, would depend upon the size of the vessel. As a final touch, the external surface of the skin is fine polished, which, in the first place, serves to preserve it from cracks and fissures, and what is equally important, greatly diminishes the liquid friction, and thus facilitates its passage through the water.

As might be surmised, a ship thus built is a good deal heavier, and consequently has a larger displacement than one constructed of wood; but she would be very much lighter than one built altogether of iron or steel, with a heavy inner and outer skin of solid metal plates. Again, the cost of the double skins in cement concrete is very considerably less than that of a corresponding plating of metal. It is stated that the strength or resistance of a vessel thus constructed is in no degree inferior to that of other ships built on very different lines. Be that as it may, but still the new departure is significant, and without for a moment either eulogising or depreciating the apparently *fin de siècle* attempt at shipbuilding we await the future development of it with both interest and circumspection.

T. C.

SANITARY APPLIANCES.

MESSRS. BROAD AND CO., Limited, South Wharf, Paddington, issue a comprehensive illustrated catalogue of their sanitary and drainage specialties, fireclay and earthenware closets and fittings, ridge and roofing tiles, moulded bricks, &c. The illustrations are coloured, and show every variety of sanitary goods, many of new design, white enamelled ware of a superior manufacture. We particularly direct attention to several new designs introduced by Messrs. Broad and Co., Ltd., such as their channel interceptors on white enamelled ware, designed specially for use in inspection chambers. In this interceptor the cap of the cleaning arm is made with a Stamford joint. All sizes and prices are given in this very perfect form. Broad and Co.'s "Locking Cup" for cleaning arm is a security against displacement. The "School Board Interceptor," made in white ware for the London School Board, 6in. or 9in. dia., and 4in. arm, and Broad and Co.'s patent white enamelled channel bends (half-circle section), and a specially designed bend to prevent oversplashing from subsidiary drains (three-quarter circle section) are worth notice, and the sizes, curves, and prices are clearly stated. The deep-section channels are worth notice. The 6in. channels are made $4\frac{1}{2}$ in.

* The Science of Brickmaking. By GEORGE F. HARRIS, F.G.S., &c. London: H. Greville Montgomery, Essex-street, Strand.

deep, and the 4in. channels 3in. deep. Broad and Co.'s "connecting pieces" for making a good junction between these channels, and a similar pipe in brown ware, are useful, and illustrations are shown. Complete disconnection between water and gully-trap can be secured by Broad and Co.'s "channel-shoe and reversible gully-trap" (p. 30), which is a clever combination of pipes. The trap is reversible and can be fixed at any angle, which allows the intakes to be kept in line with wall.

Other illustrations show some excellent channel blocks (white enamelled) for lavatories or traps, yard-gullies, grease-traps. Broad and Co.'s "Impermeable" pipes made of cream Bristol stoneware perfectly non-absorbent; a patent sink of glazed cane ware, besides various forms of stoneware goods; Broad and Co.'s white enamelled fireclay closets, on the flush-down system, drain plugs for testing, and an improved water-waste preventer. The terracotta goods, red moulded bricks, finial, roofing tiles, paving bricks, and clinkers are well selected in design and make. The catalogue will be found useful for reference.

CONSTRUCTION OF ARCHES IN CONCRETE.—VIII.

IN a previous article we drew attention to the Melan, the Roebing, the Metropolitan, and the Expanded Metal system, all of which belong to what we have already classified as the combined or compound system of arches constructed in concrete. While obviously possessing some features in common, they are all, nevertheless, rendered separate or distinct from one another by one or more distinguishing characteristics which claim our attention. For the present, we leave the first mentioned of the four systems alluded to, inasmuch as it has been previously described and illustrated in our columns. Of the next two, we are not in the possession of so much information as we should wish; but so far as the last—that is, the Expanded Metal system—is concerned, we have before us the results of an extended investigation and analysis of experiments conducted by engineers of unquestionable ability and reputation. Although the principle of combination remains constant in all these three systems, yet the last mentioned has some very essential properties of its own which merit attention. Following the order or method we have laid down, the Roebing system demands our notice, of which a partially isometrical view is represented in Fig. 1. It is, at any rate for the present, essentially a floor design, and not to be compared in point of span and accompanying dimensions with some of the examples which have been laid before our readers. It consists primarily of small concrete arches, turned between the stereotyped rolled wrought-iron or steel joists, the span of which latter, and consequently their size and sectional area, will depend upon, and vary with, the especial requirements of each particular case. In arches of comparatively very limited spans, the rule already stated for the proportion or the ratio between the span and the depth is frequently not adhered to. For, let R and R_1 = the respective ratios for a large and a small span concrete arch, put SS_1 , O , and D , for the corresponding spans and depths, then for the large arch we have—

$$R = \frac{S}{D} = \frac{1}{10}.$$

and for the smaller example—

$$R_1 = \frac{S_1}{D_1} = \frac{1}{8}.$$

But although the value of R remains fairly constant as defined by theory, that of R_1 is often determined more by practical than any other considerations. In Fig. 1, AA are the rolled floor beams, BB , in thick black curved lines, are arched bands of wire netting, peculiar to this system, which are further stiffened by iron rods $\frac{1}{2}$ in. in diameter at about every couple of feet apart. The concrete, sleepers, and wooden flooring, not required to be shown in the cut, are laid in the ordinary manner. Wire netting is also fixed horizontally along CC , upon which the plastered ceiling is secured.

While there is undoubtedly considerable latitude of selection allowed to the inventors, designers, and patentees of compound constructions of concrete and metal, and also to those who may desire to adopt them, there are nevertheless certain well-recognised and well-appreciated

FIG. 1.

principles which ought to govern the selection. One of the chief objects of the dozen or more different combinations now more or less in actual use was to diminish the great weight of the old brick jack arches, as they were usually termed, or, in other words, to reduce the total weight of the flooring to a minimum per square foot. In the first place, the ordinary rolled iron or steel joist with equal upper and lower flanges is, *par excellence*, the proper section to be employed, both as regards strength and economy for the beams or joists. Independently of practical experience, theoretical dictates, founded partly upon the value of the moment of inertia of this particular type of beam, have established the superiority of this form of section. It is represented in Fig. 2, and a very slight acquaintance with the principles of the calculus will enable its moment of inertia to be determined.* The expression for it is simply a particular application of the well known general equation for the moment of inertia of solid rectangular beams, in which if b be the breadth, d the depth of the beam, putting I for the value of the moment of inertia—

$$I = \frac{b \times d^3}{12}$$

In the example in Fig. 2, let b be the breadth of each flange, which are equal, and t the thickness, d the depth from outside to outside of flange, and t the thickness of the web of the joist. Then if I be the moment of inertia of the section with respect to an axis xx , the expression is—

$$I = \frac{[b d^3 - (b - t_1)(d - 2t)^3]}{12}.$$

It will follow therefore that the rolled steel or iron sections selected should have a somewhat similar formula for the value of their moments

FIG. 2.

of inertia; or, what practically amounts to the same thing, their shape and the proportions of their relative dimensions should not greatly vary from the example shown in Fig. 2. It may be here pointed out that the wire netting at BB of the Roebing floor system in Fig. 1 constitutes a permanent centring for the arch, and consequently no temporary or false centres are required when the erection of the arches is in course of construction. This is a decided advantage, although, perhaps, a small one, and it is possessed also by the Expanded Metal system, in which the expanded metal replaces the wire netting. Having determined upon the proper section for the floor-beams, there is one point more to which attention should be given, and that is to their spacing or distance from centre to centre. In a word, they should not be placed too closely together, unless the loading is so abnormally heavy as to constitute a case calling for especial treatment. Under ordinary loading—although it may be stated that no two engineers or architects agree as to what is ordinary loading—if the floor-beams are packed too closely together, and as their spans are comparatively limited, they will have but a proportionally small depth, which may not be deep enough to impart to them that amount of rigidity which they ought to possess. It has already been laid down as a rule admitting of no exception, that any system which relies, except to a very limited

* It may be mentioned here, for the benefit of our younger friends, that in nearly all examinations for professional situations worth anything at all, a certain amount of acquaintance with both the integral and differential calculus is required.

extent, upon the tensile strength of the concrete, should be sedulously avoided. One might just as well depend upon the tensile strength of cast iron.

A reference to Fig. 1 of the present article, or to similar sectional views of the compound systems of the construction of arches in concrete in former articles, will not fail to draw the attention of the reader to the fact that a much greater quantity of the one material is present in the design than of the other. It might be remarked that as the one material is much stronger than the other, so necessarily must the relative volumes, bulks, and masses of the two materials vary accordingly. To a certain extent, this assumption is admissible, but it does not go far enough. It nevertheless unquestionably leads up to the question, Is there any proper proportion to be observed between the absolute quantities of the two or more materials, as the case may be, which constitute the component parts of the whole design? This is an important part of our present subject, as many people are apt to imagine that a few tons of concrete more or less are of no consequence, and that the whole conglomerate mass is pitched in, and piled up in a happy-go-lucky, haphazard, half-reckless kind of manner. This is not the case, at any rate in good engineering and architectural practice; nor would it be permitted in even moderately high-class work. Before proceeding to another example of the combined system of building concrete arches, it will be as well to enter a little more in detail regarding the part played, and the relative quantities of the different materials needed, in that particular class of design.

The employment of steel and iron in almost an infinity of different sections, from wire of actual minimum diameter to heavy bars, to strengthen arches of concrete is now a very common occurrence, the object being in all instances to increase the ultimate resisting powers of the concrete arches where they may become subjected to stresses of a tensile character. The exact analysis or solution of the problem presents many difficulties, and, in fact, like numerous others of a similar nature, does not admit of a strictly or rigorously accurate adjustment. But at the same time, it is quite possible to arrive at a solution sufficiently approximately accurate to serve for all practical purposes. There are at first, two data to be obtained, which will vary nearly with every individual example, although the discrepancy will not be of any particular importance. In any case, whether large or small, an average can be calculated, which, from the number of experiments undertaken at different times for the purpose of establishing the data required, may be regarded as safe and reliable. Two of the most important of these are—(1) the modulus of elasticity of the particular description of concrete used, and (2) the length of time which has intervened between the date of the fabrication of the concrete and that when it is first subjected to actual working conditions. It is at this latter date that the value of the modulus of elasticity is to be determined, which will obviously depend upon the nature of the ingredients of the concrete, their respective quantities, either in terms of their weights or volumes, and the manner, more or less efficient, in which the whole mass is mixed and thoroughly incorporated. The very best ingredients will fail to give satisfactory results, if the mixing process be not of a most intimate character. Clearly the question of the quantity of water to be added to the mixture crops up here, and it is unfortunately one for the solution of which it is simply impossible to lay down any hard-and-fast rule. The opinions, and consequently the practice, of engineers with respect to the amount or proportion of water with which the ingredients should be mixed varies so widely that the one extreme may be represented by an almost fluid mass, and the other by an almost desiccated mixture. Between this limit, the nature of the site, when the concrete is to be

used for foundation purposes, will no doubt in some degree regulate the supply of water.

The value of the modulus of elasticity for concrete will depend altogether upon the composition and description of that material, but for the fairly good ordinary Portland cement specimens may be put at 1,000,000. But when the compound is used in the form of clinker or cinder concrete, which latter is common in the construction of fire-proof flooring for stores, warehouses, and other large buildings, the modulus of elasticity drops down to about 100,000. It may be accepted that in the combined systems of building arches in concrete which we are now considering, the working load, or loads, will be borne by the different members or component parts of the structure in direct proportion to their respective rigidities. Rigidity, or as it is frequently termed, stiffness, is that property of a body, by virtue of which it resists any force or forces tending to cause it to alter its shape or form. If we put W to represent the load upon any beam, L equal the length, a the cross-sectional area, b the breadth, d the depth, and V = the deflection for the load W , then the rigidity or stiffness of the beam is found from the general formula—

$$E = \frac{W \times L^3}{4 V a d^2},$$

in which E is the modulus of elasticity of the material. Since the rigidity of a body is inversely as the deflection, it follows that in a compound structure for similar areas, or quantities of component parts, the relative rigidities will have to each other the same proportion as their respective moduli of elasticity. The modulus of elasticity of ordinary Portland cement concrete has been assumed to be equal to 1,000,000, while the usual value for the same coefficient for steel is 28,000,000. It necessarily follows, therefore, from the preceding statement, that a single inch of sectional area of steel will oppose the same resistance to a deformation or alteration of form as 28sq.in. of concrete would do in a similar position. The resistance of the combined system may be determined by substituting a quantity of concrete for the steel wire or bar equivalent to twenty-eight times the sectional area of the latter, placed in the horizontal plane of the steel bar. This arrangement, in which D may be regarded as simple concrete beam, is shown in Fig. 3.*

FIG. 3.

Having found the moment of inertia for the beam, its strength, when the concrete fails by cracking on the tension side, may be then determined. Make M = moment of the resistance of the beam when the concrete cracks, I = the moment of inertia of the Transformed section, T = the ultimate tensile strength of the concrete, and x the distance from the neutral axis, $A-B$, in Fig. 3. The value of M is given by the equation—

$$M = \frac{T \times I}{x}.$$

We shall subsequently refer briefly to some particular applications of this general formula, but must first discuss the remaining combined systems introduced to our readers. It will be both interesting and instructive to compare the results of the experiments conducted in England with those arrived at by the trials and tests undertaken in Austria and on the Continent.

ARCHITECTURAL ASSOCIATION EXCURSION, 1897.

ARRANGEMENTS are now being made for the annual outing of the Architectural Association. Mr. Hampden Pratt, the new president,

* Those who wish to pursue this subject further are referred to a valuable work just published, "The Materials of Construction," by J. B. Johnson, C.E., Professor of Civil Engineering in Washington University, St. Louis, from which we have quoted. For a discussion of the case where the concrete cracks and the elastic limit of the steel bar is reached, as well as for the case where the concrete cracks on the tension side and then fails in compression because of the strength of the steel bar, see an excellent article by the author in *Engineering News*, Jan. 3, 1895.

will conduct the party, and Mr. Talbot Brown is the hon. sec. The following places, near Lancaster, are proposed to be visited (the County Hotel, Lancaster, is to be the headquarters):—Cloughton Hall, Lancaster, a very quaint 15th and 16th-century house, partly gone; Chesford-by-Hall, having a fine coat-of-arms over the west door; Melling and Tunstall churches; the bridge and church, Kirkby Lonsdale; Cark Hall, an old mullioned house of the 16th century, with very thick walls; Cartmell Priory; Borwick Hall, of the time of Charles I., where Charles II. stopped the night, sharing the hospitality of Sir Robert Bindloss—the hall was illustrated by a perspective and plans in our issue of Dec. 31, 1886; Beetham Hall; Hornby Church; Houghton Tower; Samesbury Hall, some half-dozen miles from Preston, on the high land between the Ribble and Darwen. This was a most secluded spot until 1825, when the new turnpike road from Preston to Blackburn was carried within 3ft. of the house. A view of the hall is given in Rimmer's "Old Halls of Lancashire," 1852, and a valuable monograph on the "History of the Ancient Hall at Samesbury," enriched by copies of old deeds and pedigrees, was published by Mr. James Croston, F.S.A., in 1871. The hall was "restored" in 1835, and was afterwards used as an inn; it was once quadrangular and moated. The minstrels' gallery was added during the restoration, when to make a front for the gallery parts of the beautiful screen and of a Jacobean bedstead were chopped up. The old windows, which are figured in Parker's "Domestic Architecture," have been replaced by others with attenuated mullions. Other particulars of the house are given in Alram's "History of Blackburn." The members will also visit Livesey Hall; Levens Hall, of formal-garden fame, illustrated by the late J. D. Sedding in his book on "Gardening"; Holker Hall, a seat of the Duke of Devonshire, on the banks of an estuary of the Leven, situate in a fine park; additions to the house were made by Messrs. Paley and Austin, who also restored Thurland Hall after a fire. It is a moated house, and sometimes is called a castle. This mansion will be included in the programme, to which for the final days Furness Abbey and Lancaster are given.

OBITUARY.

MR. JAMES W. GRUNDY, senior partner of the firm of Messrs. J. W. Grundy and Son, architects, of Brogren-street, Ulverston, died suddenly at his residence, Richmond-terrace, on Thursday morning in last week, from syncope, in his 76th year. Deceased was a native of Bentham, but commenced business as a joiner and builder over half a century ago, subsequently adding to it that of an architect. He was the architect for the Stone Cross mansion, the Ulverston, Dalton, and Millom Co-operative Stores, Croftlands, Ulverston Temperance Hall, Market House, Post Office, Sun Hotel extensions, Hinning House, Bootle; he also put up the Savings Bank clock, and remained the custodian of it to the time of his death; he was also architect for many other public and private buildings in the town and district. For years deceased was clerk to the Lighting and Watch Inspectors, sergeant and quartermaster in the local Volunteer corps, and was also a member of the local lodge of Freemasons. For some time Mr. Grundy has been in failing health, but has not been confined to the house. Up to recent years he took an active part in the affairs of the town.

The Bath City Council have raised the salary of Mr. Gilby, assistant waterworks engineer, from £250 to £350 a year.

The death is announced, at an advanced age, of Mr. Josiah Thomas, for very many years city surveyor of Bristol. Mr. T. H. Yabbicom, borough engineer, has been appointed by a committee to carry out the duties of the office pending a permanent appointment, which will probably not be made until the committees of the council have reconsidered the positions of the officers in the event of the Boundaries Extension Bill passing into law.

The foundation-stone of the new out-patients' wing which is to be added to the West Kent General Hospital at Maidstone as a memorial of the Queen's long reign, was laid on Tuesday week. The wing is being built at a cost of £2,800. Mr. Hubert Bensted, of Maidstone, being the architect. Mr. T. Elmore is the contractor.

COMPETITIONS.

BURY, LANCs.—The corporation adopted at their last meeting the following recommendations of the art gallery committee: That the following instructions be given to the architects submitting competitive designs of the proposed art gallery—viz., that the size of the rooms for the Wrigley Collection be 90ft. by 35ft. for oils, 37ft. by 23ft. for water-colours, and 30ft. by 23ft. for engravings; that the building line be set back as follows—viz., Moss-lane and Silver-street 12ft., Back Knowsley-street 2ft., and on the side near the Textile Hall 6ft.; that there be no caretaker's house on the premises; that the cost of the building be £18,000; that the question as to heating the building be left open; that the entrance to the gallery be in Moss-lane; that August 31 be the last day for sending in competitive drawings.

IPSWICH.—At the last meeting of the School Board, the works committee recommended for adoption the conditions under which they proposed that architects practising in Ipswich should be invited to send in competitive plans for new premises for the Higher Grade School to be erected on the Tower-street site. No premiums are offered; the board will pay the architect from whose plans the school is erected the usual commission of 5 per cent. on the amount of the accepted builder's tender; plans to be delivered on July 13th. On the suggestion of Mr. William Eade, F.R.I.B.A., a member of the board, it was decided to extend the time for sending in plans till September 14th.

NEWCASTLE NEW INFIRMARY.—A meeting of the Newcastle Infirmary Building Committee was held on Friday. Thirteen firms of architects, it was said, had intimated their acceptance of the invitation to send designs in competition for the new building. With regard to the application made to the Town Improvement Committee of the Newcastle Corporation, for a piece of ground adjoining the site at Forth Banks, a deputation was appointed to wait on the committee at their next meeting. As soon as the negotiations with the corporation for the site are completed, instructions will be issued to the architects. The premiums for the competition are as follows:—First, the execution of the work at the usual commission; second, £150; third, £100; and fourth prize, £50. It was agreed that the architects should be allowed six months from the issuing of instructions to send in their plans. The following is the list of competitors:—William Henman, Birmingham; T. Worthington and Sons, Manchester; Simpson and Milner-Allen, London; Gibson and Russell, London; Dunn, Hanson, and Fenwick, Newcastle; Oliver and Leeson, Newcastle; Armstrong and Knowles, Newcastle; Newcombe and Adams, Newcastle and London; Dyson, Newcastle; Marshall and Dick, Newcastle; Haswell, North Shields; Clark and Moscrop, Darlington; and F. Caws, Sunderland.

CHIPS.

While a steeplejack named John Booth, aged 60, was working on a chimney at the Jarrow Steel Works, on Thursday week, he fell a distance of 90ft., and was killed.

At the last meeting of the Rochdale Town Council, allegations were made that weak timber is being used in the erection of houses. The borough surveyor, Mr. S. S. Platt, has since been instructed to prepare a statement fixing the minimum strength which, in his opinion, should be allowed.

A bust of the late Sir John Pender, executed by Mr. E. Onslow Ford, R.A., was formally presented to University College, Gower-street, W., on Friday, together with a cheque for £5,000, to be applied to the endowment of the electrical laboratory of the college.

The Finance Committee of Aberdeen Town Council had under consideration on Friday a report by the burgh surveyor for the extension of the sewerage system of the city. The total cost of the works as recommended by the burgh surveyor is £75,000, but the committee agreed to recommend that a section of the scheme should meantime be departed from, leaving the estimated expenditure at fully £40,000.

A few days ago the representatives of the late Mr. J. H. Williamson formally opened their new brick-works (the Non-Porous Brick and Tile Company), situate by their colliery at Chesterton, by giving a dinner to the whole of their employés, including those from Goldenhill Colour Works, numbering over 300 in all.

Building Intelligence.

BIRMINGHAM.—Princess Christian visited Birmingham on Wednesday for the purpose of opening the new buildings of the General Hospital. The structure is of red brick and terracotta, and has been erected from the designs of Mr. William Henman, F.R.I.B.A., of that city, at a cost of £210,000. The central pile is in the Later Victorian style, with projecting wings flanked by towers and connected by transverse corridors, with a number of semi-detached blocks or pavilions harmonising in style with the central group, and extending over an area of some 500ft. in length by 400ft. in depth. The combined frontages measure 1,470ft. The site occupies the whole of one side of St. Mary's-square, in the rear of the new Victoria Law Courts. The predominating idea of the design is the employment of octagonal forms in the towers, turrets, buttresses, and gable terminals, the vertical lines of which are broken by horizontal bandings and panel work. Messrs. Barnsley and Sons, of Birmingham, have been the contractors.—Carr's-lane Chapel was re-opened on Sunday, after restoration. The old gallery fronts, which have been the subject of various experiments in decoration, have now been superseded by fronts of solid English oak. In the galleries the whole of the pews have been removed, and for them have been substituted single lift-up seats, similar in structure to those with which theatre-goers are now familiar. The walls and ceiling have been redecorated, and also the iron columns and arcing. The iron girders and supports at the entrance to the body of the chapel have been hidden under mouldings of fibrous plaster. Screens have been erected in the vestibule, and additional exits have been provided at the pulpit end of the chapel. The chapel is now lighted by electricity, chiefly by means of light brass pendants. The expenditure altogether will amount to about £6,000. Messrs. A. R. Dean, Limited, have undertaken the internal reconstruction and decoration.

FOLKESTONE.—The Hotel Metropole, on the West Lees at Folkestone, has just been opened under the auspices of the Gordon Hotels, Ltd., and furnished and decorated by Messrs. Smee and Cobay, of Moorfields, E.C., and 139, New Bond-street, London. The architect, Mr. T. W. Cutler, F.R.I.B.A., has designed the building in the Late Victorian style. The building is squarely designed with rectangular wings at the rear, forming courtyard, and the façade is relieved with square projecting bays and loggias and balconies. A copper-covered central dome with balcony round it surmounts the edifice. The sanitary work has been carried out by Mr. G. Jennings, of Lambeth. No soil or slop-drain has been permitted inside the building. All baths, w.c.'s and lavatories are detached from the main building by aerated lobbies. The grounds are laid out with walks, lawns, and flower-gardens, and a band-stand is situated in the centre. The walls are damp-proof, and the roof, floors, corridors, staircases, and walls are fireproof and sound-proof. No wood lathing or bratticing is used throughout the building. All communicating doors are double and sound-proof. The wiring for electric light requires no protection, and is Andrews' concentric wiring and cables. All corridors and principal rooms are warmed and ventilated with warmed fresh air. Fire-alarms are distributed over every floor, and fire hydrants cover the whole building. The foundations of the hotel were executed by Mr. H. Lovatt, of Wolverhampton, and the building has been erected and finished by Mr. W. J. Adcock, J.P., of Dover, Mr. Chedgoy acting as the resident manager. The building is faced with dark red bricks from the High Broom Brick Co., Tunbridge Wells, and terracotta executed by the Burmanoffs Company. The roofs covered with light green Tiberthwaite slates, the dome to centre roof being covered with copper by Messrs. Braby and Co. The constructional iron and steel work, some 700 tons, has been supplied by Messrs. Drew-Bear, Perks, and Co. The fire- and sound-proof floors by Banks' Fireproof Construction Syndicate, together with all coffered and other ceilings, cornices, encasement to iron columns, &c., which were covered with helical steel lathing, no wood lathing being used throughout the building. The partitions, where not brick, are constructed of iron framing and lathing, incased in solid plaster, and are perfectly fire-proof

—a patent of the above company. All the stair-cases and external steps are fire-proof and executed in Stuart's granolithic concrete. The rooms in roof are fire-, heat-, cold-, and sound-proof, being specially finished with Anderson's silicate cotton. All communicating doors between rooms are removable, and are double and sound-proof. All sashes are removable, and can be cleaned inside rooms, and are fitted with N.A.P. patent fastenings. The warming and ventilation, cooking apparatus, complete installation of electric light and bells, and the whole of the engineering work (except lifts) has been executed by Messrs. J. Slater and Co. In the basement, the kitchen, larders, pantries, service-rooms, and offices are lined throughout with glazed bricks, also dado in corridors, and paved with wood-block flooring. The service, luggage, and passenger lifts have been erected by the Otis Elevator Co., with all the latest improvements. The visitors' hall, main staircase, balustrade, dining-room, chimney-piece, &c., have been executed in marble by Messrs. Burke and Co., from the designs of the architect. The marble mosaic floors are by Burke and Mainzer and Co. The Carton-pierre enrichments to large and small dining-rooms, ball-room (Renaissance), drawing-room (Louis XV.), billiard-room (Spanish Renaissance), were executed by Messrs. G. Jackson and Sons, from the architect's drawings. The stained glass and some decorative painting are by Messrs. Campbell, Smith, and Co. Two subject panels in lounge were modelled and painted by Messrs. Moria and Jenkins. The whole of the furnishing and equipment of the hotel has been specially designed and executed by Messrs. Smee and Cobay, and the decorations were carried out by them under the directions of the architect. The hotel contains over 250 bed and sitting-rooms, and on the ground floor, arrival entrance and hall, visitors' entrance hall and lounge, entrance to ball-room and suite. Two dining-rooms, reception-room, drawing, reading, smoking, and billiard-rooms, and the necessary service rooms. The hotel stands in its own grounds of about four acres, and is bounded by roads on all sides. Mr. W. Woodward and Mr. J. Davies have acted as clerks of works, and the building has cost about £150,000.

HITHER GREEN.—The Prince and Princess of Wales will open on Monday next the new Park Hospital erected by the Metropolitan Asylums Board for the treatment of scarlet fever, diphtheria, and enteric fever at Hither Green, near Lewisham. The hospital is said to be the largest for acute cases of fever in the United Kingdom. It stands on a site of twenty acres on the summit of a slight hill clothed with trees. The buildings forming the hospital are 42 in number. There are 18 pavilions containing 108 wards, varying in size from those for single beds to others 120ft. long for 20 beds, with separate residences for the officials and larger homes for the male servants, the female servants (with accommodation for 90 maids), and for the nurses. This last consists of three blocks, containing about 200 rooms in all. The servants, kitchens, stores, &c., are arranged in the centre, with a water and clock tower, and to the east, west, and south of this centre are grouped the various pavilions for the different diseases, all separated one from another, and the whole being connected to the central administration by arcaded covered ways open to the air. Beneath these are subways for steam heaters, water and steam pipes, electric cables, &c. The whole hospital is heated by steam and hot water, lighted by electricity, fitted with fire appliances and electric alarms, telephones, and other modern appliances. Wells are being sunk on the site to supply water from the chalk, the estimated maximum daily consumption being over 200 tons. An apparatus is provided for softening the water before it enters pipes and boilers. All the cooking is done by gas or steam, and the walls of the kitchen buildings are lined with glass. The architect of the hospital is Mr. Edwin T. Hall, F.R.I.B.A.

PETERBOROUGH.—The completion of the present restoration of the north-west gable of Peterborough Cathedral was marked by the formal placing in position, on Monday, of the cross which terminates the gable. The whole of the cross, with its original base, was lifted into position in one piece. The dean, Dr. Ingram, Canon Clayton, and Miss Alderson, daughter of Canon Alderson, assisted in laying the bed of Portland cement on which the cross was to rest. The work has been carried out by Mr. John

Thompson, of Peterborough, and very few new stones have had to be introduced to take the place of those which were completely ruined by the weather. There are only two new stones in the outside order of the great arch, and with the exception of two small patches the large string course has been replaced intact. Every stone has been put back into its original position, having been carefully numbered before being taken down.

SHERINGHAM.—The new church of St. Peter's, Lower Sheringham, and the new burial-ground recently added to the churchyard of All Saints', Upper Sheringham, were consecrated on St. Peter's Day by the Bishop of Norwich. The building consists of a nave 87ft. long, with a lofty arcade on each side, north and south aisles 75ft. by 10ft., chancel 35ft. 6in. by 22ft. inside screens and 42ft. between walls, with an arcade and aisles on the north and south sides. Porches are built at the west end of the north and south aisles and to the vestry. The chancel will be eventually inclosed by screens, forming an ambulatory around the sides. Accommodation is provided for 600 people in the nave, chairs being used, to which are fixed kneeling-boards. The font is against the west wall of the nave. The organ-chamber will be in the north chancel aisle. A large bell-cote has been constructed at the west end of the nave, to hold three bells. The walls externally are faced with flint, with Douling stone dressings for the windows, &c., and the roof is covered with slates. The architects are Messrs. St. Aubyn and Wadling, of London.

WALTON.—The Baptist Chapel at Walton, near Felixstowe, is being renovated and enlarged at a cost of £900. The memorial stone was laid last week. The north and west walls have been rebuilt substantially. A new floor and new benches, the latter all facing the east end, are to be laid. The pulpit and platform, formerly occupying a position along the north side, are to be rebuilt along the east wall, and designs for a new baptistery, to be placed near the same spot, have been prepared by Mr. Alfred Cunder, F.R.I.B.A. Two narrow side galleries will be fixed, and a deeper end gallery, and the roof of the chapel will be raised internally some 4ft. The contractor is Mr. Robert Girling, of Ipswich.

WOLINGHAM.—On Saturday, the Bishop of Durham reopened the parish church, after undergoing important renovations and improvements. An addition has been made to the west end of the church, where the baptistery is now located, together with some additional seats, the floor of the church has been entirely relaid with blocks of wood upon a concrete foundation, the church has been re-seated, and a new pulpit added, all being of Hungarian oak. The altar is also new, and an improved heating apparatus of hot water has been fixed together with a new lighting arrangement, the gas brackets being suspended from the roof in place of the old fixtures on the pews. The total cost has been close upon £800. The alterations were carried out from designs by Mr. C. H. Fowler, F.S.A., Durham, by Mr. Westgarth, builder, Wolsingham; Mr. W. Hudson, joiner, Bishop Auckland; and Messrs. Dinning and Cooke, of Newcastle-on-Tyne.

The old Bell Hotel, Holborn, the last of the famous galleried coaching houses in London, was put up to auction on Monday at the Mart, Tokenhouse-yard, as a building site of 7,200ft. The highest bidding for the 80 years' lease, with the licence, was £11,600, at which premium price it was sold to Mr. Fitch, surveyor, of Furnival's-inn. The rent will be a peppercorn for the first year, and £750 per annum for 79 years.

At a general meeting of the Institute of Painters in Oil Colours, held on Monday night, Sir E. J. Poynter, P.R.A., Sir E. Burne-Jones, Mr. G. F. Watts, R.A., Mr. Frank Dicksee, R.A., and Mr. Frederick Sandys were elected honorary members. Mr. W. Llewellyn, Mr. Julius Olsson, Mr. Niels M. Lund, Mr. W. B. Wollen, R.I., Mr. Alfred Withers, and Mr. Robert Noble, A.R.S.A., were elected members.

The Duke of Devonshire, as Lord President of the council, and official head of the Department of Science and Art, has appointed Mr. George Coffey, B.A., to the office of superintendent of Irish antiquities in the Dublin Museum.

A petition was filed in the Lincoln Court on Tuesday week against George Arthur Gill, of Bardney, plumber. The usual receiving order was made, and the debtor has, upon his own application, been adjudicated bankrupt.

Engineering Notes.

LEITH.—During the past six months good progress has been made with the erection of the new wet dock at Leith. Since the beginning of the year four or five steam navies have been engaged in excavating the area for the new dock, and early the contractor, Mr. John Best, commenced the construction of the dock wall by putting in the concrete base on which it rests. One part of the masonry has now been raised to a height of 28ft. The whole of the foundation of the north wall has now been laid. The wall is about 20ft. thick at the base, and diminishes in thickness till it reaches the top, where it is 8ft. The coping of the wall is 40ft. above the bottom of the dock. Steam navies are also at work excavating the new entrance lock from the east pier which is to be 70ft. wide, and is to be fitted with iron gates worked by hydraulic machinery. Another steam navy is employed digging a passage between the new dock and the Albert Dock. The swing bridge across this lock has now been placed in position in order to give communication to the west side of the Albert Dock while the passage is being constructed. The bridge is 130ft. long, 27ft. wide, and weighs about 350 tons, and is to be fitted and worked by hydraulic machinery. On the bridge there are two lines of rails and a footpath on each side. The deepening of the entrance channel is also proceeding, a dredger being engaged in this work, one third of which has been completed.

WATER SUPPLY AND SANITARY MATTERS.

LONDON WATER SUPPLY.—The Water Committee of the London County Council have prepared a series of resolutions which they will ask the Council to pass at its next meeting. (a) That, in the opinion of the Council, the water supply of the Metropolis should not continue in the hands of private companies. (b) That, in the opinion of the Council, the undertakings of the Metropolitan water companies should forthwith be purchased at the fair and reasonable value of the same, regard being had to the rights, special circumstances, and obligations of the companies. (c) That the management of the water supply should be effected either (1) by the London County Council supplying its own area directly and outside authorities in bulk at a fixed price; or (2) by the London County Council supplying its own area only and the outside authorities supplying their areas; or (3) by a new body supplying directly the whole area both within and without the county. (d) That, in any case, as the County of London contains 87 per cent. of the ratable value and over 79 per cent. of the population of the whole area supplied by the Metropolitan water companies, and will thus be liable for more than four-fifths of the purchase money, it is desirable that the London County Council should, in the first instance, be the purchasing authority on behalf of the population of the whole area concerned. (e) That if the undertakings of the water companies are not acquired, it is essential that effective powers of control should be given to the County Council, and, further, that the position of the companies should be reconsidered and the law amended, particularly as regards their power to make and recover rates and charges and divide profits, and their obligation respecting the supply of water.

NEWPORT PAGNELL, BUCKS.—At a meeting of the Newport Pagnell Rural District Council, the scheme of main sewerage and sewage disposal for the town of Newport Pagnell was approved after being fully considered and approved by the Parochial Sanitary Committee, and it was decided to apply to the Local Government Board for sanction to a loan for carrying out the work. The scheme has been designed by Mr. D. Balfour, M.Inst.C.E., F.G.S., of Newcastle-on-Tyne and Edinburgh. The whole of the town is to be properly sewered with freelay socketed pipes, and, where subsoil is wet, Hassall's watertight jointed pipes are to be used, especially adjoining the rivers Ouze and Ouzel. The sewage will discharge into an underground storage tank, from which it will be lifted by centrifugal pumps driven by gas-engines in duplicate, and forced through a rising main to the disposal works, where it will be specially treated by chemical or bacteriological tanks and land. Special means are to be taken also to prevent the flooding of the town during heavy rains by means of relief culverts.

In the House of Commons, on Monday night, Mr. Balfour announced that the Government had accepted the recommendation of the Committee on the Housing of the Wallace Bequests, and will purchase for the nation the mansion in which this splendid collection now rests.

PARLIAMENTARY NOTES.

WESTMINSTER HALL.—Colonel Welby (Taunton) asked the First Commissioner of Works last Friday whether it was intended to complete the architectural design of the north front of Westminster Hall by filling the niches with statues of personages connected with the history of our country. Mr. Akers Douglas (Kent, St. Augustine's): There is no proposal, such as my hon. and gallant friend suggests, under the consideration of the Office of Works.

PLUMBERS' REGISTRATION BILL.—This measure, as amended, again came before the House of Commons sitting in committee on Wednesday night. Mr. Briggs moved to insert in Clause 3 after "established" the words, "in each county and borough council area in England, Wales, and Scotland." His object was to give to the local authorities, who knew the needs and wants of the localities, the power to carry out the Act.—Mr. Whittaker complained that amendments were being accepted which entirely altered the whole framework of the Bill. He did not consider the amendment of his hon. friend much of an improvement. If there were to be registration and examination, there ought to be uniformity and one registration body. On a division the numbers were:—For the amendment, 70; against, 166; majority, 96.—Mr. Warner moved an amendment to the effect that it should be left to the Local Government Board to make such arrangements as would be necessary for creating a council. The clause before the House and the schedules were far too complicated to admit of their being discussed with any adequacy in what remained of that sitting. The only practical course open to the supporters of the Bill was to agree to delegate some of the authority of that House to the Local Government Board, and to empower that department to frame rules for the constitution of the Plumbers' Council.—Mr. John Burns wished to hear the views of the secretary to the Local Government Board on this suggestion. Under the complicated scheme provided in the Bill, simplicity and uniformity of registration could not be hoped for. The Local Government Board was well qualified by its past experience to frame rules for the formation of the proposed general council, and the sanitary education of our plumbers was surely a matter in which the Board ought to take a special interest. The officials of the Board had damned this Bill with faint praise, and the secretary to the Board apparently did not know what attitude to take up.—Mr. T. W. Russell said that the same proposal that was now made was made in the Standing Committee, and was so unpopular that a division was not even taken. The hon. members who had spoken to-day proposed to lay a very serious duty upon the Local Government Board, a department which was overburdened with work already. The provision in the Bill in regard to the appointment of the general council had been carefully considered by the Local Government Board, and they were of opinion that the schedule was adequate for the purpose. Considering the work the Local Government Board had to do, he must decline, on behalf of the board, to undertake the proposed responsibility.—After remarks from Sir F. S. Powell and Mr. Tomlinson, Sir J. B. Maple said he could not understand a Government complaining that too much work was put upon one of its departments; but he considered that plumbers had no more right to be examined than bricklayers or any other class. It ought to be the duty of the Local Government Board to see that architects, surveyors, engineers, and foremen of building works were properly qualified as well as plumbers. The plumber, after all, carried out his work under the instructions of the architect and of the foreman of the works.—Sir J. Lubbock said he understood that the main ground why the Local Government Board refused this duty was in consequence of the character of the duty. Surely it was for the House to say what should be done, and then doubtless it would be carried out adequately by the officials of the Local Government Board.—Mr. Wolff thought it was of the greatest importance that the examination should be of a uniform character.—General Laurie believed that whether the amendment was adopted or not, the Local Government Board would ultimately have, owing to the defective proposals of the Bill, to take over the work the amendment proposed to place on them. Sir H. Fowler said his experience of the Local Government Board was that it was very much undermanned and very much overworked. On that ground, therefore, he could not vote for the amendment. The House was anxious to throw everything on the Local Government Board, and then when the Board did their best they were attacked for what they were doing. Sir J. Brunner thought the Local Government Board was the best authority to control the examinations. The House divided, and there voted—For the amendment, 99; against, 199; majority against, 100.—Mr. Whittaker moved to leave out the whole of Clause 3 after the words "The general council shall consist of the following members," in order to insert words providing that the council should consist of the following:—One representative

of each of the bodies enumerated in the Schedule B, and ten operative and ten master plumbers (in each case six being from England, two from Scotland, and two from Ireland) to be elected by the registered operative and master plumbers respectively. He said that the general arrangements in the Bill for the election of a general council were clumsy and unsatisfactory; and as the council was to discharge the most important and responsible duties, it was highly necessary that it should be a competent and impartial body. His amendment would obviate the necessity for huge meetings all over the country to elect representatives on the council.—Mr. Knowles opposed the amendment on behalf of the promoters of the Bill. It offered no adequate machinery, whereas the constitution of the general council under the Bill was most carefully considered by the Grand Committee, who made the general council as representative as possible of plumbers, sanitary persons, and other individuals who would be effective members of it. He could not see how in any particular the proposed new general council was any improvement upon the one in the Bill.—Sir J. B. Maple decidedly preferred the constitution of the general council set out in the amendment to that in the Bill. For instance, what did ironmongers know about the examination of plumbers?—General Laurie and Mr. Burns spoke in a similar sense. A division was challenged, but on the question being again put, the amendment was negatived and the debate stood adjourned.

CHIPS.

The aggregate for last week at the Auction Mart was only £46,243, and a comparison with those of the corresponding week of last year—£231,263—affords a striking proof of the present flatness of the market. Not only was there a shorter supply, but the demand was very feeble for all classes of property, and nothing like a proper average of the lots submitted found purchasers.

The Liverpool Corporation have decided to place at the disposal of the Parks Committee the sum of £7,690 for the purpose of laying out part of the site of Kirkdale Gaol as a recreation ground. This new place of recreation will contain about 6½ acres of land.

A successful artesian bore has just been completed in Baston Fen, on the estate of the Right Hon. Lord Kesteven. The water rock was tapped at a depth of 170ft., when a very fine supply of water was obtained, rising 20ft. above the service, and yielding an overflow of 5,000 gallons per hour. Mr. Noble, of Thurlby, was the contractor for the work.

A reredos has been erected in Olney parish church. The work has been carried out by Messrs. Jones and Willis, of London and Birmingham. Caen stone has been used, relieved by pillars of Devonshire marble, coloured black, grey, and red. The centre panel contains a lamb, representing the Agnus Dei, and the side panels contain figures emblematic of the four evangelists, the tops of the panels being diapered and fitted with crocketed labels. The tracery is carved in the Gothic style, with conventional capitals, and figure-heads at the top of the marble pillars, four pinnacles surmounting the centre portion.

A five-light window, illustrative of scenes from the Old and New Testaments, has just been erected in Clifton Church, near Tamworth. The five lights show the Birth, Baptism, Crucifixion, Resurrection, and Ascension of Our Saviour, and in the tracery above are pictures of subjects from the Old Testament. The work was entrusted to Messrs. Jones and Willis, of Birmingham and London.

We omitted to mention last week, in our notice of the opening of the new Shoreditch dust destructor, that the roofs are glazed on the patent system of Messrs. W. E. Rendle and Co., of Westminster Chambers, 5, Victoria-street, S.W.

The Bishop of Norwich visited St. Margaret's Church, Starston, on Wednesday week, to dedicate the churchyard cross which the parishioners have erected to commemorate the Queen's record reign. The cross is of Portland stone, and follows generally the design of St. Martin's Cross, Iona; it is 14ft. high; the carving introduces V.R., 1837-1897, with the rose, shamrock, and thistle.

On Sunday week special services were held at St. An. An new, Old Chesterton, in celebration of the insertion of a stained-glass east window. The central figure of the window, which has five lights, is Our Lord in glory, crowned as Head and King of the Church, and wearing His priestly robes as the Great High Priest. The five lights also contain at the top the Four Evangelists, with their symbols. Beneath these, in the three centre lights, are the Annunciation, the Nativity, and the Presentation in the Temple. On the north side is the figure of St. Andrew, on the south St. Michael; these have underneath the arms of St. Andrew and of Hervey de Stanton.

FIRST AND SECOND PREMIATED DESIGNS FOR THE SUTHERLAND INSTITUTE, LONGTON.—MR. ALFRED BEIT'S MANSION IN PARK LANE.—THE SWANSEA METAL EXCHANGE.—WESLEYAN MISSION SCHOOLS, GROVES, HULL.—A HOUSE AT CASTLEMORTON.—DETAIL OF FRONT ELEVATION OF SELECTED DESIGN FOR THE NEW CITY HALL, BELFAST.

Our Illustrations.

SUTHERLAND INSTITUTE, LONGTON.

We illustrate this building by the two designs placed first and second by Mr. W. Gilbee Scott in an open competition, and whose selection was afterwards endorsed by the Longton Town Council. This double event was won by Messrs. Wood and Hutchings, architects, of Burslem and Tunstall. The site was given by the Duke of Sutherland, and the foundation-stone was laid in January last, with Masonic honours, by the Prince of Wales. On the ground floor provision is made for a free library, and the remainder of the building will be devoted to technical purposes, having well-arranged rooms for science and art, cookery, and manual training. A caretaker's house is also provided, and the site is large enough to permit of easy enlargement in the future. The buildings will be constructed of brick, with stone dressings, and fireproof construction throughout, the estimated cost being £8,000, but the contract is not yet fixed.

MR. ALFRED BEIT'S MANSION IN PARK LANE.

THIS house, which is now (except in respect to some of the internal decorations) complete, has been erected on a leasehold site belonging to the Grosvenor Estate. It is bounded on the north by Mount-street, on the east by Park-street, on the south by South-street, and on the west by Park-lane. On the north and east the house is separated from the street only by wide areas. On the west and south, however, space has been left inside the fence wall for a garden. In studying the plans it will no doubt strike the observer that apparently little advantage has been taken of the southern aspect, so important in this climate. The reason forms a key to some peculiarities both in plan and design. Originally it had been intended to erect two houses on the site, and Mr. Alfred Beit, the owner of the house, took a lease of the northern portion only. In these circumstances no view could have been obtained from windows looking south, and but little sunshine would have shone on the southern wall. It was not until after the building had progressed too far to alter the plan that Mr. Beit took a lease of the remaining portion of the ground, and decided to erect upon it the winter garden and billiard-rooms shown on the plans. All architects will appreciate the difficulties which attend efforts to make such additions as this harmonise with a design already complete in itself. It will be noted that all the lines have been picked up, and that the treatment of semicircular arches carried on black granite columns, already adopted for the north porch and west bay, has been repeated in the addition. The plans speak for themselves. All the reception rooms are on the ground floor, and provision has been made for the easy circulation of guests at large entertainments. The centre

hall and staircase are of English oak, elaborately carved. The suite of rooms on the first floor facing west, above the two drawing-rooms, are Mr. Beit's private apartments. There are on this floor, in addition, two bedrooms and dressing-rooms. Above this, again, are guests' rooms, all these enjoying a magnificent view over Hyde Park. The men-servants are accommodated in the basement, and the women servants on the east side of the second floor. It should be noted that the height of the building was limited by the terms of the lease. The walls are faced with brown Portland stone, and the columns are of Aberdeenshire black granite, half-polished. The floors of the balcony over the west bay and of the flat over the billiard-room are of marble. The contractors are Messrs. G. Trollope and Sons. The architects are Messrs. Balfour and Turner, of 10, Buckingham-street, Strand.

THE SWANSEA METAL EXCHANGE.

THE Swansea Exchange (Incorporated) have just opened their new headquarters, Fisher-street. For the past ten years the members of this important organisation have been meeting at the theatre of the Royal Institution of South Wales; but it was felt that a more suitable and commodious meeting-place should be erected for the Exchange business transactions. The committee accordingly secured a site at the rear of the "Cambrian" office in Fisher-street. Plans were prepared by Mr. H. W. Wills, architect, of Castle-square, and the building of the exchange was intrusted to Mr. Thomas Davies, St. Helen's-avenue, who has now carried out his contract. The new Swansea Exchange is built in an adaptation of what is known as the Queen Anne style, in red brickwork, with stone dressings. The main entrance is from Fisher-street. The principal entrance has columns on either side, whilst above there is some carving with a centre figure allegorical of Swansea. The corridor is tiled, and leads into the large exchange, the inside of which is 50ft. by 40ft., and 20ft. high, and has a curved elliptical roof. It is lighted by elliptical windows, containing upon them the arms of Swansea. The building also contains 21 other rooms, arranged in suites for offices. The roof is covered with tinplates instead of slate, though with what success it is as yet difficult to say. The building, which cost £4,000, is in a most central position, and should afford a convenient meeting-place for commercial men.

WESLEYAN MISSION SCHOOLS, GROVES, HULL.

THESE buildings, just completed, are situated upon a good corner site at the junction of Jennings-street and Cleveland-street, and comprise an assembly hall 53ft. 6in. long by 36ft. 6in. wide, with side balconies and end gallery (accommodating about 600 persons), approached by good entrances from Jennings-street, and surrounded by twelve class-rooms, library, kitchen, &c., on the ground floor—as will be seen by the plan given with the view. A large junior school and minister's vestry are planned at the rear, with an entrance from the side street. There are large class-rooms on first floor for young men and young women respectively, available for week-night meetings. The hall has a partly-open timbered roof, and is lighted from above by a continuous clerestory glazed with leaded lights. The walls are faced with Lincolnshire red pressed bricks; the bricks are from Ruabon. The weatherings are in Howley Park stone, and the tracery windows are executed in Ancaster stone. The inside joiner's work is framed in Californian red wood with panels of red deal, slightly stained and varnished. The front windows and inside door panels are glazed with leaded lights. The builder is Mr. Edward Good, Barmston-street, and the architects are Messrs. Gelder and Kitchen, of Lowgate, Hull.

HOUSE AT CASTLEMORTON.

THIS was built in 1890 for Mr. R. H. Cazalet, seven miles from Great Malvern, in brick rough-cast in cement with red tile roof. It has three sitting-rooms, one 31ft. by 14ft., and seven bedrooms, with bath-room and hot and cold water supply. The builder was Mr. Wm. Porter, of Malvern Wells. The architect is Mr. C. F. A. Voysey.

BELFAST TOWN HALL.

WE have already given plans, views, and elevations of both the first and a second design selected in this recent important competition. The first we printed on June 18 and the second on June 25 last. To-day is published a detail drawing of

the chosen design, front elevation. The architects are Messrs. Thomas and Son, of Westminster, and for further particulars of the scheme our readers will do well to refer to our previous descriptions of the work.

CHIPS.

On Saturday afternoon Mrs. Thos. Ashton laid the foundation-stone of a new technical school and free library at Hyde. It is estimated to cost £12,000.

The Roman Catholic cathedral of the Immaculate Conception at Sligo was consecrated last week. The building is Late Byzantine in style, very plainly treated, and has cost, from first to last, £58,000.

The Pension Office building at Washington is asserted to be the largest brick building in the world. Its rectangular base is 400ft. by 200ft. The exterior measurement is 316ft. by 116ft. on the inner court. The height from floor to glass roof is 89ft. Each of the supporting columns is 25ft. in circumference at the base, and contains 100,000 bricks. The first story walls are 3ft. thick, and 2ft. 2in. above. The interior of the building is divided by brick partitions into 170 rooms.

At Tuesday's meeting of the London County Council, the Works Committee reported that a recent sale by auction of timber unused by the Works Department had resulted in a loss of £674. The cost of the timber was £2,781, including rent.

The Works Committee of the Edinburgh and District Water Trust opened, on Monday, eight tenders in connection with Contract No. 6 of the new water-supply scheme. The work involved consists of ten miles of tunnelling and covered aqueducts, beginning at Broughton Station, and joining Mr. Best's contract at Broomlee Station. The offers varied in amount from about £130,000 to about £100,000. The five lowest were remitted to the engineer for examination and report.

The Hartlepool Board of Guardians having to vacate their present premises for the extension of the municipal buildings, have decided to purchase a site of 1,200 square yards in Hart-road as a site for their new offices, and will expend about £3,000 in building.

On Sunday week the R.C. Bishop of Down and Connor laid the foundation-stone of the new church of St. Vincent de Paul Ligoniel, Belfast. The church will seat about 1,300 persons. The nave walls are now about ready for roofing. It consists of nave and aisles, the general dimensions being 100ft. by 50ft. and 50ft. from floor to ridge. There are five bays on each side of the nave, and a projecting semi-octagonal apse, with which is connected a sacristy, and a meeting-room on the first floor above the latter. The style is Gothic, and the building is faced with ashlar.

At a meeting of the Morley Town Council, on Monday, it was decided to make an application to the Local Government Board for sanction to borrow £8,000 for the erection and furnishing of public baths, according to plans and specifications submitted by Mr. Fox, of Dewsbury.

The formal opening of Port Royal Harbour, Peterhead, took place on Monday. The area of Port Royal as now extended and deepened is nearly six acres, and the work has cost £32,000, including £12,000 for forming a quay wall in the South Bay. The quantity of rock excavated has been 160,000 tons, and the whole work has been carried out within a year.

A pulpit has been erected in Holy Trinity Church, Dorchester, as a memorial to the late rector (Rev. H. Everett). The work was intrusted to Mr. Harry Hems, of Exeter.

At the Town Hall, Wolverhampton, on Monday, Mr. Rienzi Walton, C.E., held an inquiry on behalf of the Local Government Board with regard to applications by the town council for sanction to borrow £23,847 for paving work, £7,600 for the public baths, £2,500 for the purchase of the Exchange Hall, and £2,050 for the purchase of the site for the new free library.

The new church of St. Peter, Bocking End, near Braintree, was consecrated last week. The section completed consisted of nave with clerestory, chancel vestries, and base of tower. The walls are of stock bricks, with red brick quoins, and the roofs are covered with red tiles. Mr. J. T. Micklethwaite, F.S.A., of Westminster, was the architect, and Mr. W. Parmenter, of Braintree, was the builder.

The old tower of the parish church of Cadoxton-juxta-Neath is about being restored, under the superintendence of Mr. C. B. Fowler, F.R.I.B.A., of Cardiff. The cost is estimated at £300, and it is proposed to add three bells, making a peal of six, at an additional cost of £200. The tower is one of much interest, and is in Early 14th Century style. It is proposed to restore only the portions which are perished and dangerous, preserving all the sound parts.

FIRST FLOOR PLAN

SECOND PREMIAED

A sepia-toned photograph of a grand, multi-story classical building, likely a government or institutional structure, viewed from a low angle. The building features a prominent pedimented roof, numerous windows with arched tops, and a series of columns. A large, ornate entrance is visible on the right side. The building is reflected in a body of water in the foreground, creating a symmetrical effect. The overall tone is historical and formal.

QUESTIONS.

[11701].—**Floor Construction.**—I have a building to erect, about 100ft. square, with first and second floors supported on columns. The floors will have to bear heavy weights, probably approaching 5wt. per square foot. What would be the most substantial and economical construction for floors that must be laid with stone or concrete slabs? Hints as to the proportions of the concrete arching, thickness, resistance of lateral thrust, structural ironwork, &c., would oblige.—DEVONIAN.

REPLIES.

[11691].—**Ornamental Plaster.**—There is a very interesting and practical book, entitled "Plastering: Plain and Decorative," by W. Millar, published by Mr. B. T. Batsford, 94, High Holborn.—CONTRACTOR.

[11694].—**Sound.**—Prevention of the transmission of sound through walls can only be attained, I believe, by means of a judicious application of Fred. Jones and Co.'s patent combined silicate cotton and plaster slabs. "W. T. T." should obtain samples, &c., from manufacturers.—J. C.

LEGAL INTELLIGENCE.

A BIRMINGHAM ARBITRATION.—In the Birmingham Racecourse Company's arbitration, two arbitrators, with Sir Douglas Galton as umpire, sat in Birmingham for fourteen days, extending over Christmas and the commencement of this year, to deal with a reference to them of the claims of the Earl of Bradford and of Lord Newport, who alleged, in connection with the making of the new racecourse on their lordships' lands near Castle Bromwich, that considerable works provided for by the lease had been left undone, and that other works had been imperfectly and improperly carried out, and heavy damages were claimed in default of the execution of such works. The Racecourse Company claimed that, if their lordships' claims were just, it rested with the Nottingham Contract Corporation, Limited, who undertook all liability for them, to make good whatever was ordered as against them. The award of Sir Douglas Galton, the umpire, has now been made. It is in favour of the Earl of Bradford and Lord Newport, and against the Nottingham Contract Corporation, who are ordered to recoup the Racecourse Company in respect of nearly all the works and payments ordered, and the Nottingham Contract Corporation are also ordered to pay the whole of the costs attendant on the arbitration.

A BUILDER'S ACCIDENT POLICY.—Before Mr. Justice Henn Collins and a special jury last week the case of "Gibbs against the Norwich Accident Insurance Association" was decided. This was a claim by Anne Gibbs, executrix of Edwin Gibbs, of Cardiff, builder, against the defendants to recover a sum of £1,000, the amount of an insurance effected with them on the life of the deceased. The deceased on August 19, 1895, signed a proposal form for an insurance for £1,000 on his life, the premium for which was £5, and effected a fire policy at the same time. On September 3 Mrs. Gibbs wrote for her husband to inquire whether the insurance had been accepted, and on September 4 received an answer in the affirmative, and in fact the policy was signed by two of the directors and the secretary and sent to their Cardiff agents on August 26. On October 1 Gibbs met with an accident by falling off a ladder on some buildings he was erecting, and received injuries which resulted in his death on October 5. A message was brought to deceased's daughter on the day of the accident, but the injuries were reported to be slight. On her way to the infirmary to see her father she called at the office of the company and paid the premium, her mother having told her two days before to do so, a fact which had escaped her memory. The reason she gave for paying it when she did was that she was afraid if it was not paid her father would lose the advantage of the sick pay which he was entitled to under the policy. At the time she paid the premium she did not inform the agent of the accident, and this fact was strongly relied upon by the defendants as a suppression of a material fact. They also sought immunity from liability under a proviso in the policy that it was issued upon the express condition that the policy was to have no effect in any year unless and until the premium for that year should have been duly paid. It was further contended by them that they were protected by an arbitration clause in the policy. The jury found in favour of the plaintiff on all the issues, and judgment for £1,000 was entered for her. A stay of execution was granted on the money being brought into Court within a week and notice of appeal given within 14 days.

THE RIGHT TO CONSTRUCT PIERS IN LAKES.—At Appleby, before Mr. Justice Bruce, the case of "The Attorney-General and the Bowness-on-Windermere Urban District Council v. The Furness Railway Company" terminated last week. The plaintiffs sought to obtain an injunction to restrain the defendants from erecting within a part of Bow-

ness Bay on Lake Windermere a new pier, or extending the already existing pier, and they also claimed damages for trespass. The defendants, who had owned the existing pier since they commenced running their steamers on the lake in 1870, were anxious to extend the pier to accommodate larger boats. The greater part of the existing pier is within that part of the bay of which the council are tenants. The defendants accordingly gave notice to the council of their intention to enlarge the present pier by adding about 90ft. The council objected to the proposed extension on the grounds that it would be a serious obstruction to navigation on the lake, and that it would greatly interfere with the public right of way and navigation over the lake. Damages for trespass were claimed, because defendants had placed their plant and machinery upon the land of the council, thereby causing an obstruction. The plaintiffs were willing for the defendant company to erect a pier on an adjoining site. The defendants urged that they only proposed to extend the pier on that part of the bed of the lake beyond that of which the council were tenants, also that the public had no right of way over the lake, and that Lord Lonsdale was entitled to the soil and bed of Lake Windermere, and that they had, as his tenants, received his written consent to the proposed extension of the pier. The defendants submitted that the plaintiffs had for some years past been filling up the foreshore and the bay at the shore end of the pier, thereby depriving them of the use of a considerable part of their pier. Numerous witnesses were called by the plaintiffs to prove the public rights on the lake. The following cases were quoted during the hearing:—"Bourke v. Davies," "Harrison v. Duke of Rutland," "Regina v. Russell," "Rex v. Ward," "Attorney-General v. Terry," "Marshall v. Allowater Steam Navigation Company." A large body of evidence was also called by the defendants. The learned Judge, in summing up the case, left several questions to the jury. Ultimately the jury found that the public had from time immemorial exercised the general right of navigating the lake in all directions and over the part of the waterway in which the defendant's proposed to erect the new pier without hindrance; also that various landing-places on the lake had been used by the public as of right from time immemorial, and that the right of passing in vessels and boats from the landing-places at Bowness over the part of the waterway in which the defendants proposed to erect the new pier to other public landing-places on the lake had been similarly exercised. They found that the proposed pier would be an obstruction, but they could not agree whether the benefit to the public outweighed the inconvenience caused. The learned judge gave judgment for the plaintiffs, and granted an injunction.

STAINED GLASS.

WESTHOUGHTON CHURCH, BOLTON.—Five new stained-glass windows have just been placed in the south aisle of this church, the subjects being respectively: "The Nativity of Our Lord," "Samuel and Eli," and the Works of Dorcas. The windows are from the studio of Messrs. Powell Brothers, of Park-square, Leeds.

DEWSBURY.—A three-light stained-glass window has just been placed in the south aisle of St. Mark's Church, Dewsbury, in memory of Arthur and Stanton, sons of Mr. Samuel Mayman, of Dewsbury. The subjects illustrated are: "Samuel Ministering before the Altar with Eli," "Our Lord Disputing with the Doctors," and the "Incredulity of St. Thomas." Each picture is in rich and harmonious colours, and surrounded by delicate canopy work. The window has been designed and executed by Messrs. Powell Bros., of 30, Park-square, Leeds.

The Corporation of Hull have signalled the bestowal of the dignity of a city on the ancient borough and county of Kingston-upon-Hull by adopting, by a large majority, a scheme for paving all their main roads and certain other streets with wood instead of granite.

The new promenade at Colwyn Bay is approaching completion. It will cost about £13,000, and is being constructed by Mr. Jacob Biggs, contractor, Farm-street, Birmingham. The esplanade and roadway (20ft. wide) extends from the railway station eastward about a mile, forming an inward curve below the embankment of the London and North-Western Railway. The surface of the promenade varies in width from 40ft. to 90ft., and is being asphalted by the Val de Travers Company. It is provided with cart crossings, kiosks, lavatories, &c. The outer wall is being constructed flush with the surface, so that at high tides the waves will reach the promenade proper. The approach to the new work is obtained by means of a subway constructed beneath the railway line at the east end. Eventually the promenade will be extended another half mile, so as to reach Old Colwyn. The undertaking is being carried out under the supervision of Mr. William Jones, A.M.I.C.E.

Our Office Table.

PROBABLY there are few, even amongst archaeologists, who are aware that there are within seven miles of the Bank of England the well-defined remains of a Roman camp. This camp is situated on Uphall Farm, on the eastern bank of the river Roding, between Ilford and Barking, and is of the usual four-square shape on a slight elevation above what was formerly marshy ground. The vallum, though much reduced by centuries of agricultural operations, is still recognisable on all four sides, whilst on the river side there is a higher elevation, evidently for look-out purposes. Now this relic of the past is threatened with extinction by the irrepressible builder, the farm being advertised for sale (to-day) as building land. Cannot the destruction of this antiquity of some 15 centuries be prevented? If the area could be dedicated to public purposes and the inclosure turned into a garden or even cricket field, it would be of lasting benefit to the fast-growing population of this district. Once destroyed, it can never be replaced.

THE annual exhibition of drawings, needlework, designing in paper and colour, modelling in clay and cardboard, woodwork, cookery, laundrywork, and kindergarten, executed in the various schools of the School Board for London, will be held at the Hugh Myddelton School, St. James's-walk, Clerkenwell Green, E.C., from Friday, the 16th July, to Wednesday, the 21st July (Sunday excluded), from 12 o'clock noon to 8.30 p.m. The exhibition will be opened by the Marquess of Londonderry, K.G. (Chairman of the Board.) Practical demonstration lessons in cookery, laundrywork, and needlework will be given each day. Admission to the exhibition and demonstration lessons will be entirely free, and it is hoped that the public will largely avail themselves of this opportunity of seeing specimens of the work being done in their schools.

IN order to make way for the memorial to Lord Leighton in St. Paul's Cathedral, the Dean and Chapter propose to remove to the crypt the monument erected by the nation to the memory of Captain Burgess, who was killed in the action off Camperdown, 1797. The relatives of the gallant captain protest most vigorously against it. There is grave doubt, however, whether they can make their opposition effective. If it were a parish church the monument could not be moved without a faculty, and the Diocesan Chancellor would require the family to be cited. But in the case of a cathedral the Dean and Chapter are supreme. The Burgess monument was erected by special command of George III. in response to a unanimous request from the House of Commons.

THE London County Council will shortly receive a proposal from the Highways Committee for providing the electric light on the Victoria Embankment and Westminster and Waterloo Bridges. It is recommended that the Council shall establish its own building and plant for producing the light, and that lamp standards shall be placed at the sides, and not in the centre of the carriage-ways. It is proposed that there should be provided in all 90 arc-lamps of the Jandus pattern, and that of these 54 should be placed on the Victoria Embankment, 27 on each side, 10 on Waterloo Bridge, 11 on Westminster Bridge and its approaches, and the remainder at Northumberland-avenue approach and other points, eight being placed on the piers adjacent to the Embankment. The proposed site for the generating station is a piece of ground adjacent to the Charing Cross Station of the District Railway, power having been obtained in a recent Act to use the ground for that purpose. It is not intended under the present scheme that the lamps on the river wall shall be lighted by electricity, but should this be decided on later, the generating plant provided will be sufficient to supply the additional energy required. The committee do not think it advisable that the ornamental gardens on the Embankment should be lighted by electricity. The first cost of the installation is estimated at £22,000, and the cost of maintenance will be about £1,900 a year. The present annual average charge for lighting the Embankment and bridges is about £1,300.

ONE of the most destructive fires that have occurred in Ayr since the disastrous burning of the woollen mills, exactly twenty-one years ago, took place yesterday week, when the Town-hall and organ were destroyed in the course of less

than an hour, and other surrounding buildings were seriously injured by either fire or water. The hall, built from plans prepared by Messrs. Campbell Douglas and Sellars, had sitting accommodation for 1,400. It contained a handsome organ, which cost about £2,000—a sum which was raised largely through the efforts of the late Dean of Guild Hunter. Adjoining the hall were the offices of the town clerk, chamberlain, and surveyor; in front, aligning the street, were shops; while behind, at the south-west of the hall, were the houses of the keeper and other employees of the burgh. The whole buildings cost about £40,000. This was exclusive of the spire which rose from the centre of the block.

THE Departmental Committee on Dangerous Trades have issued an interim report upon the dangers connected with electrical generating works. The peculiar danger is the liability to shock, which is often fatal if, by accident, anyone comes into contact with the conductors when charged to a high pressure. The contact need neither be very perfect nor direct; provided two parts of the body are made to touch conducting materials which themselves differ in pressure by 1,000 volts or more, or even by much less if the contact with the flesh is very good, a dangerous—and possibly fatal—shock will result. High-pressure overhead wires, even if insulated over their entire length, can never be considered as entirely free from risk. As illustrating the dangers incidental to the use of electricity, it has been stated that, in addition to minor accidents, of which we hear little or nothing, fourteen deaths have been reported since 1892. The committee make a series of recommendations for the furtherance of safety in these works, and suggest that all persons engaged in them shall be instructed in methods of artificial respiration to be applied in case of accidents. They further recommend that a specially-qualified person be appointed to advise the Secretary of State or the chief factory inspector on matters requiring technical knowledge of electricity.

THE proposed new builders' by-laws for Scarborough, which will in a fortnight become law, will, Mr. A. W. Sinclair, builder, of Commercial-street, in that town, writes, "very detrimentally affect the growth of the town, greatly increase the cost of houses, without a proportionate increase in size or convenience, and consequently will touch the pocket of each resident by increase of rent." As he says: "One cannot have 18ft. asphalted back streets, concrete under the whole area of buildings, inspection chambers built of glazed bricks in every yard, greatly increased yard area, thicker walls and timbers, drains laid in concrete, and other requirements, without paying for them."

THE question of constructing subways under the streets of London for the reception of the tubes and wires of the gas, water, electric, and other companies, which was mooted rather more than a year ago, but which fell through owing to the magnitude of the scheme and the large expense it would involve, has again been under consideration; and it is now proposed to introduce a Bill into Parliament to construct such subways. The rents to be paid by the various companies using them are to be determined by agreement, or failing agreement by arbitration of the Board of Trade. The expenses of construction and maintenance will be shared by the local authorities and the London County Council.

AN instructive illustration of the advantages of the municipalisation of tramways appears in the third annual report of the working of the Glasgow City Tramways. The number of passengers who travelled on the cars was, in round numbers, ninety-nine millions, and the money they paid in fares amounted to £365,761. Had, however, the fares been in force which were exacted when the tramways were under private management, £180,000 more would have had to be paid by the passengers than they actually did pay. The gross profits for the year were no less than £84,596, which is about the same as for the preceding twelve months, notwithstanding the increased competition there now is owing to the new District Subway, the Glasgow Central Railway, and other suburban lines opened during the year. Since the Glasgow tramways have been taken over by the corporation, halfpenny fares, which have proved very popular and very profitable, have been instituted, and arrangements are now in progress for the introduction of electric haulage, which has been recommended by a committee of the city council that has lately made personal

examination of the most approved methods of electric traction for street cars, both on the Continent and in America.

THE 46th annual report of the Birkbeck Building Society states that during the financial year just closed the total receipts have reached the large sum of £18,967,010, exceeding by more than one-and-a-half million pounds the total receipts of all the other incorporated and unincorporated building societies in the United Kingdom—numbering 2,625—as shown by the Chief Registrar's return, presented to Parliament on the 23rd April last. The receipts from subscriptions have amounted to £240,082, and from deposits to £14,678,767. The withdrawals have been £13,880,483, showing a balance over the preceding year of £1,038,366, or a total increase since 1892 (a period of five years) of £3,438,741, after allowing for the large amounts withdrawn during the panic in that year. The total liabilities on subscriptions and deposits now exceeds nine millions (£9,113,454). The balance of assets in excess of liabilities amounts to upwards of four hundred thousand pounds—£400,186 16s. 4d. The total assets are £9,513,641. The 15th triennial bonus has been apportioned this year in accordance with the rules. The sum, with the bonus previously set aside, but not yet payable, will absorb £61,179 10s. This amount is provisionally credited to all members holding investing shares, but the bonus is only payable provided the instalments have been regularly made, and then not until the shares have been ten years in existence. A further sum of £25,000 has been added to the permanent guarantee fund, which now stands at £200,000, the whole amount being invested in consols. During the past year 2,538 members have joined the society, whilst 2,212 current accounts and 7,173 deposit accounts have been opened, making a total of 11,923 new accounts. The shareholders now on the register number 12,760, current accounts 17,818, and deposit accounts 48,919, making a total of 79,497 accounts now open. The number of shares in existence at the close of the year is 65,985. Since its establishment the society has returned to the shareholders and depositors more than one hundred and eighty millions (£180,130,323), the whole amount having been repaid upon demand. The amount advanced to borrowers has been £3,225,315, and the amount of interest and bonus paid to investors and depositors is upwards of three millions sterling, the exact figures being £3,057,331.

CHIPS.

The annual meeting of the National Trust for Places of Historic Interest will be held this (Friday) afternoon at 4.30 p.m. at the Society of Antiquaries' room, Burlington House. The Duke of Westminster will take the chair as president, and among the promised speakers are the Marquis of Dufferin, Sir W. B. Richmond, R.A., Sir Henry Howarth, and Mrs. Octavia Hill.

The foundation-stone of a new chancel was laid at Stockingford, Nuneaton, on Saturday, the 19th ult., by Lady Wickman. A silver trowel was presented to Lady Wickman by the architects, Messrs. J. R. Veall and Son, Wolverhampton. The cost of the chancel, &c., is about £300. The builder is Mr. T. Smith, of Chilvers Coton, Nuneaton.

Lady Esther Smith, who was accompanied by the Hon. W. F. D. Smith, M.P., performed on Monday the ceremony of laying the memorial-stone of the new parish house of St. Clement Danes and Clare Market. The building is being erected on a site in old Clare Market at the corner of Vere-street and Sheffield-street.

Princess Christian's prizes will again be offered for competition at the Artists' Guild (Exhibition-road) Ninth Amateur Art Exhibition in November next. The exhibition is open to all amateurs.

It is expected, says the *Western Mercury*, that the conference of the National Association of Master Builders, to be held in Bristol on the 20th inst., will be attended by about 150 delegates from all parts of the kingdom. The last conference of the Association in Bristol was twelve years ago, under the presidency of the late Mr. W. H. Cowlin. The president of the Association this year is Mr. T. F. Rider, F.R.G.S., of London. The arrangements for the forthcoming conference have been carried out by the local committee, consisting of Mr. A. Krauss (president of the Bristol Association), Mr. W. Church (vice-president), Messrs. C. A. Hayes, Geo. Wilkins, Geo. Humphries, E. Walters, F. N. Cowlin, and H. J. Spear (secretary). The questions to be discussed include the apprenticeship indenture, the Workman's Compensation Bill, and the Plumbers' Registration Bill.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2219.

FRIDAY, JULY 16, 1897.

MODERNISM IN ART.

A GREAT deal is implied under the term "modernism." It includes not only what is modern in construction and method, new inventions in building, but that modern spirit and feeling which have entered into and permeated our art generally, and it is in this sense chiefly that we now speak. The spirit of modernism, the very opposite of that which we call antiquarianism, is characterised by certain qualities and attributes which may generally be grouped under mechanical labour, repetition, and cheapness. We find it in building operations owing to the methods and modern apparatus employed, as well as in all those processes of manufacture which are employed in decoration, the manufacture and design of fabrics of all kinds. It meets us everywhere, from the building of the factory and warehouse to the design and finish of the suburban villa, or the fashionable and so-called "artistic" riverside residence or bungalow. Wherever we turn, there is a stamp of modernity on every new erection, on every piece of furniture and wall-paper; and what is it? It is an indefinable something which cannot be mistaken for an instant for anything genuinely old or antiquated, even though the architect or manufacturer has striven hard to give his work an antique look or character. In spite of appearing in an old dress or style, we cannot mistake the modern spirit and handiwork. Attempts are made sometimes to disguise our materials—to produce an appearance of roughness or irregularity in the work. In building, the architect endeavours to impart an ancient effect to his roofs and gables by using hand-made bricks and tiles of uneven colour; by giving a roughness of texture to his walls and plaster and timber-work by various devices in pointing, moulded and ornamental brick and plaster-work. For this purpose stains, antique glass and metal-work are employed. The furniture dealer who tries to mimic the antique resorts to all manner of devices to give his copies of old cabinets, tables, and chairs all the marks of worm-eaten surfaces, rude framing, and chisel-marks, diversity of colour, in which disguises he is cleverly helped by the metal-worker, the makers of stained glass and textile fabrics. These attempts are not often dictated in an honest spirit, and in proportion as they are dishonest they invariably fail to give satisfaction. But, it may be asked, Why copy the antique? If our construction and methods are superior, why not honestly express them? The answer suggests a psychological reason. Is there not something lacking in our modern work? The mind and eye appear to look in vain for real pleasure in modern buildings and work—a want of some quality to appeal to the artistic sense and feeling. The mechanical turned-out brick and tile and the machine-cut moulding have something cold and unsympathetic about them, like a piece of mechanical music. We can build more scientifically; our sanitary arrangements and fittings are much better than the old; but for some reason we naturally find more pleasure in an old house: there is an element in it we cannot obtain in the newly-built house, and that is sentiment. There is no feeling of association in the new-built dwelling, and even the copy we get of Tudor or Queen Anne or

Georgian has a poor, half-starved, meagre appearance compared with the original. When we copy the style—and we can do so perfectly on paper—we cannot put in the real workmanship of the age which produced it; the very conditions and causes which created the style are absent from our new work, and we feel almost instinctively it is an imitation. Do we not find this to be so in nearly all our modern restorations of churches and domestic buildings? The tool-marks, the mode of laying the stones, besides the want of mere age in toning down the stonework, are different. If we copy the accidents of age and the weather, we are apt to do so wrongly. Take a "spic-and-span" villa built in a cottage *orné* style, or a half-timbered residence on the banks of the Thames, like we see dozens of from Richmond to Henley. No one can mistake any of these for the genuine work of the age they represent. There is all the thinness, mechanical finish and flimsiness that distinguish a cardboard model from the real building. One thing that strikes us in these imitations is the mechanical look of regularity about them: the timbers are spaced with unerring accuracy, both sides are precisely alike; added to all, there is a smoothness and a slightness in the work which shows its origin. The old timbered houses, as we see them in Cheshire, Surrey, and Sussex, are very different: the studs are often irregular and not over-straight or evenly wrought, and they are much bolder and more massive. They are real sawn square timbers, not mere boards. Can anyone believe, when he looks on the careful restoration of the old houses in Middle-row, Holborn, that they really represent the half-timbering of the original? When we compare the old timbered roof with the modern imitation, we perceive the same difference: the regular spacing, the smooth timbers, the trim neatness of the modern, the rough-hewn rafters, uneven spacing, and warped timbers of the old. The rigid straightness of the machine-cut timber is absent. But there is the attempt now, even, to correct this tendency. Hand-made goods are sometimes substituted—better, of course, much; but the spirit of modernism is manifest in them also. There is something we can distinguish between the "hand-made" of the fifteenth century and the "hand-made" of the nineteenth. The "modern antique" is visible in it, because it assumes the air of quaintness; it takes particular shapes and details without the corresponding motive which gave them rise. These are a few of the general characteristics of modernism in art.

Let us examine a little more closely a few of those branches of architecture where the modern spirit prevails, and, first, brick-work. We can distinguish an old from a modern brick. It is always well-burnt, hard, of a good colour, and somewhat thin; whereas a new brick of the facing kind is often porous, by no means well-burned, but of true shape. The edges, though sharp, can easily be chipped. The Fareham first quality red is, perhaps, the nearest we have to the old brick. The modern taste is to get "uniform tint to be approved"; but the old brickwork we see in manor-houses and garden-walls wore a variety of tints, mottled brown, and red, and blue, just as they came from the kiln. The joints were generally struck as the work proceeded; whereas the modern method is to point at completion, to rub and stain the brickwork and tuck-point. The old jointing was also honest: the mortar was of good quality, and the joints were kept at a fair thickness; but the modern joint is often wide and irregular to fill in cracks and imperfections in the bricks, and upon these joints the brick-pointing is planted. The intensely modern brick front is generally faced with bricks of even tint, or rubbed down, and stained, and tuck-pointed. If

there is any diaper work, it is executed with black header bricks of even tint. The arches are in gauged work in orange-red rubbers, set with lime-putty in narrow joints; there is an air of intense neatness. We see such fronts to perfection in the neighbourhoods of Sloane-street, Hans-place, and other Western suburbs, some of them modernised half-timber Gothic. "Queen Anne" woodwork is even more brought under the bane of modernism. Every piece of wrought timber is machine turned out. The modern open-timber roof has its trusses sawn and planed down to the finest scantling; the modern barge-board looks as if it was cut or perforated by the yard, with a mechanical precision that contrasts strongly with the old hand-wrought kind; the mouldings are intensely hard and straight, and we have none of that artistic sense of adaptation and sympathetic tooling which we see in hand-made joinery. What can be more intensely modern than plaster-work? The modern plasterer is no longer the artist he was a century ago. We find him adopting all kinds of modernisms. His panelled and moulded ceilings are executed with a mechanical precision in line and surface which robs them of all the life and spirit of the old examples. Those very little irregularities of line of mouldings and roughness in the surfaces of the old plaster ceilings gave them a character which we only imperfectly copy in our newer methods of "running" and "floating." Our embossed fibrous plaster and other modern fabrics breathe a different spirit, though they are all based on old designs. The spirit is absent, and we can only account for its loss in the use of the tools we employ, in mechanical modes of reproduction—in other words, the elimination of hand labour. What of our ironwork? The spirit of the ancient hammered work has fled. Look at the modern railway station, as we see it in some of our main lines. There is that miserable overhanging roof over the platform, sloping sometimes one way, sometimes another. It is supported by rolled iron rafters, braced, filled in with some elaborate cast-iron ornament; or below the constructional ironwork a cast-iron spandrel of an ordinary commonplace pattern is placed, one end bolted to an iron column or supported on a corbel in the brick wall of the station. There is no connection between the cast and wrought ironwork, both of which are in the worst of taste, and join very unhappily with the brick structure behind. What with the "pressed" bricks of the station, the blue-moulded brick labels round the windows, and the obtrusive ornament, the building is a good example of all that mechanical processes can do. A recent writer has supposed the only "genuinely modern feature of architecture is the plate-glass window, and the most abhorred by all artistic architects," but we think modern ironwork is more so. A large plate-glass window is very modern, but it is not so fussy and obtrusive as cheap ironwork.

A word, too, on decoration. We have been studying "art" in many things, and our decoration of to-day is certainly far less modern in design than it used to be in the sixties; but, if we may say so, we have rather been producing the "modern antique" with a vengeance. Our efforts to produce antiquated effects, patterns, and colour, have rather overshoot the mark, and we have really been unconsciously defeating our very intention by endeavouring to reproduce, by modern mechanical means, old wall-hangings, papers, and fabrics. The consequence is that much of what we prize as "art decoration" and furnishing is really more modern in feeling than the ordinary productions they try to supersede. The real spirit and essence of modernism is cheap imitation—the desire, but failure, to produce by modern processes what is really old.

COMPETITION CONDITIONS.

ALTHOUGH there have been many suggestions for the conduct of architectural competitions, they remain practically a dead-letter. Those who compete comprise many men who are willing to regard competition as a mere speculation, and to risk their labour and skill on the barest chance. With their eyes open, they are quite ready to embark under any conditions that may be proposed, however unreasonable they may be. The leading architects of New York have drawn up a set of conditions that appear to meet the requirements of competing members, to which we may draw the attention of our readers. The first of these is that in any case "the undersigned shall be paid at least a sufficient sum to reimburse them for their cash outlay in preparing competition drawings." A most desirable condition. What architect of any repute will undertake to devote weeks or months to the preparation of a design without any remuneration whatever? Is it fair that any professional man should be called upon to give his time and labour for the bare chance of winning? Why should even the youthful tiro be expected to spend money out of pocket on such a venture? These are questions that will appeal to everyone who competes, for if a contest of skill is necessary to insure the highest standard, it is surely right that every competitor who gives away his brains should have returned to him any sum he has spent in producing his design. Another condition is that "in case of limited competition the number of competitors shall be definitely named, and that the number shall not be increased without the consent of all competitors." This also appears fair. A competitor in such a trial likes to know the real number of rivals he has to contend against, and the kind of steel he has to encounter. Then there is a stipulation that the ordinary fees published by the American Institute shall be paid as compensation to the successful competitor; that a professional advisor, or advisors, be appointed to act with the promoters in preparing a proper programme, which shall define the drawings required, and the rules of the competition. That, in the opinion of the signatories, the adviser, or advisers, be practising architects, and it is suggested that the best result can be gained by first appointing the architects to compete, and then to arrange with the promoters as to the terms of competition, and to nominate the professional adviser. Such a plan might save much heartburning and trouble. The independent mode of appointing the assessor by the promoters before the conditions of competition are prepared without consulting the competitors can never work satisfactorily. There is always a feeling among the latter that the committee are studying their own interests in nominating an assessor, and the adviser is looked upon rather askance by the competing candidates, who suppose, not unnaturally, that the assessor is appointed to assist the committee in framing stringent conditions, and that he will be biassed in his judgment. The competitors are certainly the right party to have a hand in the election of their own judge, and a mutual arrangement like that proposed by which both promoters and competitors should have a voice in his appointment seems to be the fairest course. And what more reasonable than that the competitors should help to decide upon the terms which they agree to abide by?

How much trouble and disagreement between promoters and competitors would be avoided if this plan were always followed. There would be no complaints made about unjust conditions which are now so frequent. Of course, the professional adviser will examine all drawings, and place out of competition any who has not fulfilled the terms of

competition as to date of reception, drawings and details not required, or those which do not conform exactly to the requirements, and the authors of such plans are not to receive any further consideration. Such a condition looks a little stringent; but if a competitor purposely exceeds the requirements, or does not comply with any of them, it is only fair to the remainder that he be ruled out of the contest. Too often the transgressor has been tolerated—aye! even rewarded. The man who has sent in a coloured perspective against the rule, or has submitted large drawings or models, finds many favourites, and sometimes wins, because he has been so bold and unscrupulous as to ignore the conditions others have honestly conformed to. An important condition is the last but one. It reads as follows:—"Inasmuch as the object of a competition is to adopt the general *motif* of a design to be further elaborated, and to select an architect for the work, rather than secure plans perfectly studied in all their details, the undersigned will enter upon no competition unless it shall be agreed that an award shall be made, and that an architect shall be appointed on the consideration of the relative merits of the several schemes as shown by the drawings, and that no demand shall be made for additional drawings, or for a new competition." If such a condition as this had been in force, much bitter disappointment and injustice might have been saved. The object is first to prevent unnecessary detail and labour in the design, to secure a good idea or scheme, and to select an architect. In many competitions, the idea has been to select an elaborated set of drawings, and afterwards to allow its author to alter his plans to bring them into agreement with the conditions which others have more carefully obeyed. Sometimes—and we all know instances—a highly coloured and clever perspective wins, although the plans are not equal in merit to others. The author is selected; but, as future consideration shows it impracticable to carry out the author's design as drawn, he is asked to make alterations, or the committee, having found out their mistake, rather than acknowledge their error, boldly invite a new competition, to the scandal of the local authority and the gross injustice of the competitors. We are doubtful whether the last condition is desirable—namely, that all designs should be signed by their authors, which we think in many instances would be prejudicial to the merits of the designs thus identified.

LIBRARY PLANS AT THE GUILDHALL.

DURING the present week an interesting exhibition of library plans and designs has been held in this great City of London hall, in connection with the second International Library Conference, of which Sir John Lubbock, M.P., is the president. The gathering also included a collection of library furniture, fittings, and appliances showing the latest developments and improvements which have been made in these matters. As institutions of this class increase in scale and importance, so in proportion the necessities of ready and reliable indexes or classifications make enlarged demands upon librarians and their subordinates. To meet the requirements thus created, the manufacturers of so-called "library requisites" are evidently directing their endeavours towards compactness of form and simplicity of construction, so as to save space and clerical labour as far as possible in the working of a public library. American ideas, in not a few instances, have unmistakably been adopted, and every sort of adjustable alphabetical accessory for changing, cataloguing, checking, indicating, and fixing up papers, magazines, and books as well as

their readers in comfort and convenience, finds a scope for increasing enterprise. All who are interested in the planning and arrangement of library buildings would do well to visit the exhibition to which we have drawn attention. Unfortunately, the catalogue was all behindhand; but the exhibition was open to the public without charge. The architectural drawings shown, though by no means exhaustive, may be described as fairly representative of the latest examples of buildings erected for the purpose, as the following notes will show, while photographs of such libraries as those at the Guildhall and Gray's Inn were included in the collection. The largest photograph in the hall is a remarkably fine one, representing Earl Rosebery and the Libraries Commissioners grouped in front of the Passmore Edwards Public Library at Hammersmith on the occasion of its public opening by the ex-Premier last summer. The portraits of Lord Rosebery, Mr. J. Passmore Edwards, General Galsworthy, M.P., Mr. Bull, M.P., and other notable persons more or less locally distinguished, are very clearly rendered. The building, too, appears well in detail. Its plans, by Mr. Maurice B. Adams, the architect, find a central place on another screen, by the side of the Chelsea Central Library, built some few years since from the designs of Mr. J. M. Brydon. Mr. E. B. P'Anson's Library at Clapham has a very different plan to the last named, and Mr. J. Johnson's Library at Bermondsey, with its lighting on all sides, compares with neither. The Edinburgh Library, planned on a cruciform arrangement, is a substantial and handsomely-fitted building from the designs of Mr. G. Washington Browne. Hanging close by is the new Library for St. George's-in-the-East, about to be erected by Mr. J. Passmore Edwards from Mr. Maurice B. Adams's plans, for the district of Shadwell. Messrs. Karslake and Mortimer's Clerkenwell Library—another institution worked on the open-and-ticket system—ingeniously utilises a corner site. The West Ham Institute, by Messrs. Gibson and Russell, is shown on the other side of the hall. The Central Library, Peckham-road, presided over by Mr. Edward Foskett, the well-known librarian, is one of the most extensive in South London. The architect was Mr. R. P. Whellock, whose small water-colour here exhibited should be mentioned. The Cardiff Free Library, shown by plans and elevations sent by Messrs. Seward and Thomas, is in a Classical style, with bold cornices. The Aston Manor Library and Institute, built at Birmingham, is more freely handled, and externally aims at picturesque quality. The Charles Lamb Memorial public library, which is now being built at Edmonton at the cost of Mr. J. Passmore Edwards, is represented here by the pen-and-ink perspective, published in our pages a few weeks ago, by Mr. Maurice B. Adams, its architect. The Lewisham Central Library is in evidence in a line view drawn by Mr. A. L. Guy, architect; and the Gamble Institute and Library, likewise illustrated in the BUILDING NEWS, from St. Helen's, was planned by Messrs. Briggs and Wolstenholme. St. Mary's Library, Battersea, is contributed by Mr. H. Branch; while Messrs. Potts, Son, and Hennings are to the fore with the Passmore Edwards Library at Whitechapel. Cheltenham Library, on the same screen, is a work of some pretensions by Messrs. Knight and Chatters. A large sheet of plans is shown by the Central Libraries Association of all the public libraries in Manchester; and a plan of the Queen's reading-room, Victoria, illustrates a method of classification elaborately simple. The Passmore Edwards Library, Kingsland-road, Shoreditch, by Mr. Maurice B. Adams, is an adaptation and enlargement of a building originally erected for another purpose. The Lord Leighton Memorial

Institute now approaching completion as part of the South London Art Galleries for the Camberwell Library Committee, at the expense of Mr. Passmore Edwards, is also exhibited. Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

TESTS OF THE WEARING QUALITIES OF FLOORING MATERIALS.

AT the suggestion of Mr. Frank Furness, architect, of Philadelphia, a series of tests has been carried out to determine the relative durability of various flooring materials. The experiments were carried out on May 15, by Messrs. William Gray and Sons, who are the largest contractors for stonework in Philadelphia, and they were made under the careful supervision of Mr. William J. Gray, who has given his affidavit as to the accuracy of the results as herewith published. The accompanying diagram, in which the results are drawn to scale, was furnished to the *Scientific American* by Mr. Furness.

In carrying out the tests the specimens were cemented to identical blocks of sandstone, each of which weighed 21lb. The samples presented a surface 6in. square, and the thickness of each sample was the same as that commonly used in the various floorings. In the diagram the upper figures represent the specimens attached to the blocks before being tested, the thickness of the specimen being shown to scale. Thus the interlocking rubber tile specimen was $\frac{3}{4}$ in. thick, the No. 1 Vermont marble was 1in. thick, the Oregon pine $2\frac{1}{2}$ in. thick, and so on.

The samples were all placed face downward upon a horizontal iron rubbing-wheel 10ft. in diameter, which was run for a space of one hour at a speed of 75 revolutions per minute. A suitable frame held the blocks loosely in place and prevented them from rotating with the wheel,

care being taken to let the full weight of the blocks bear upon the wheel. The face of the wheel was freely supplied during the test with the best sharp rubbing-sand and water.

The wear of the various flooring materials is shown in the lower line of diagrams, which represents the lower left-hand corner of each specimen drawn on a half-size scale. The diagonal shading shows the portion of the materials which remained intact, and the clear space beneath shows the amount that was worn away by the wheel.

By far the best showing was that made by the interlocking rubber tile, which only lost $\frac{1}{8}$ in. as the result of an hour's grinding. On the other hand, the marble mosaic collapsed altogether, the 1in. strip being rubbed entirely away within 15 minutes under a pressure of a little over $\frac{1}{2}$ lb. to the square inch. The whole slab disappeared in 35 minutes under the same pressure.

Next to the rubber the English earthen tile showed by far the best results, losing only $\frac{1}{8}$ in. in thickness; and of the stones, the granolithic made the best showing, losing $\frac{1}{8}$ in., flagstone coming next with $\frac{1}{4}$ in. wear. The marbles wore away very fast, No. 1 Vermont marble losing $\frac{1}{2}$ in. Their average resistance, indeed, was not as high as that of the woods.

One of the most curious results is shown in the action of the woods, where teak lost nearly double as much as the softer white pine, the wear being respectively $\frac{1}{8}$ in. and $\frac{1}{4}$ in. Yellow pine showed the same wear as white pine, and the oak specimen lost the same amount as its great rival, Oregon pine, which was reduced by $\frac{1}{8}$ in.

ROYAL ARCHITECTURAL MUSEUM.

THE Duke of Westminster, K.G., President of the Royal Architectural Museum, occupied the chair at the annual meeting, held on Friday last, in the central gallery of that insti-

tution. The following report was adopted, after being read and presented to the meeting by Mr. Maurice B. Adams, hon. sec. Dr. William Garnett, of the London County Council, proposed the election of the council and re-election of the Duke as President, a motion which was carried unanimously. The President, in thanking the meeting, expressed his warm appreciation of the work which was being done by the schools at the museum, and he remarked that the unostentatious labours of the council in conducting the affairs of the institution relieved the President of much responsibility. Among the speakers were Messrs. J. Hungerford Pollen, J. P. Seddon, W. R. Lethaby, Sidney Lee, W. Pain, and Maurice B. Adams. Mr. Pain is the architect for the extensions to the building facing Tufton-street, as described in the annual report. The results of the recent examinations in connection with the Science and Art Department have proved, so far as the returns have been made known, are most satisfactory to the students at the Royal Architectural Museum, as, for example, out of 53 candidates presented in drawing from the antique, 36 passed, while of the 61 students who competed for work from the life, no less than 59 passed, two only failing—an unprecedented percentage of successes. In anatomy 18 candidates entered and 13 succeeded. The report is as follows:—"The council of the Royal Architectural Museum and Westminster School of Art, in presenting their report for the year 1896, are pleased to state that, although the exceptionally favourable result of the previous year's operations has not been reached, there is a balance of income over expenditure amounting to £582 0s. 7d. As before, this result is due to the continued success of the School of Art, the fees from which amounted to £1,090 0s. 6d., whilst the grants from the Technical Education Board of the London County Council (£500) and from the Science and Art Department (£201 6s.) on the

students' works, examination, and attendance, were larger than in 1895, so that the total receipts on account of the school were £1,821 6s. 6d., against £1,843 10s. 6d. in the previous year. There is very little fluctuation in the subscriptions to the museum, amounting in 1896 to £86 16s., and derived chiefly from subscribers who have from its earliest years been staunch supporters of the institution. It was stated in last year's report that it was in contemplation to acquire premises adjacent to the museum for the purpose of building additional classrooms, and the council, after much consideration, decided to carry out this proposal, seeing that the opportunity for enlargement was not likely to recur. Plans were accordingly prepared by Messrs. Lee and Pain, and a contract has been entered into for the erection of the new building at a cost of £2,322. The full expenditure, including the provision of lighting and warming apparatus, will probably amount to about £2,630, exclusive of architects' charges. The work is now proceeding, and is to be completed by Christmas next. It is hoped that the additional accommodation thus provided will not only relieve the museum from some encroachments necessitated by the growth of the School of Art, but that it will conduce greatly to the extended success of the school itself, which, from small beginnings, has been gradually developed until it has become known far and wide, attracting students from all parts of the United Kingdom, and even from Canada and the United States. Towards this large outlay subscriptions have been received or promised amounting to £310 3s., including the sum of £100 contributed, with his customary munificence, by his Grace the Duke of Westminster; £100 has been transferred to the enlargement fund from the current account, and there is also a reserve fund of £300 Consols; and the Technical Education Board of the London County Council have undertaken to advance £500, to be repaid by deductions from their annual grants in four instalments. There is also a considerable balance at the bank, from which perhaps £1,000 may be provided in the course of the current year. Nevertheless, a substantial amount remains to be found, and additional subscriptions from friends of the museum and school will be gratefully accepted. It was but fitting that an institution enjoying the patronage of her Majesty the Queen should participate in the congratulations offered to her Majesty, on the attainment of her Diamond Jubilee, by her loyal and devoted subjects in all quarters of the globe; and an address of congratulation, engrossed on vellum, and signed, on behalf of the council, by his grace the president and by the hon. secretary, has accordingly been forwarded to the Home Secretary for presentation." In replying to a vote of thanks proposed by Mr. J. P. Seddon, the Duke said that there could be no doubt of the immense advantage which it would be to the school to have the additional premises now being added to the institution. He called attention to the fact that a substantial amount of the funds necessary to carry out these alterations remained to be found, and that, as on most occasions of this sort, they had to appeal to a generous public to supplement with their contributions the efforts of the society.

PUZZOLANA AND ITS PRACTICAL USE.*

PUZZOLANA is one of the oldest materials used for making mortar, especially hydraulic mortars. It entered largely into the construction of all the important works built by the Romans from the earliest period of their existence as a nation, and is fully and quaintly described by Vitruvius in the fourth chapter of the second book of his work. The remarkable hardness which the Roman mortars attained with age was largely due to the employment of puzzolana mixed with fat, lime, and sand. Formerly, puzzolana was found principally in the neighbourhood of Naples, and especially at Puzzoli—hence the name. At the present time similar material is known sometimes under different local nomenclature, like that from the River Rhine (Germany), where the hard, stone-like variety is called "tuff-stone," the powdered, "trass"; from the Azores Islands, where the name of puzzolana has been adopted, but a red variety is called "tetin"; from Schemnitz (Hungary); from Auvergne (France); from Teneriffa, where it is called "bosca," &c. The "Santorin-earth," from the Greek Island

Santorin, is also to be ranged with the puzzolanas. Puzzolana is of volcanic origin, and in its natural state appears as a deposit of powdered and coarse ashes, and often contains pieces of pumice-stone. Where such ashes were mixed or deposited in water, the mud thus produced hardened to a certain degree while drying. The tuffstone of the River Rhine is a good example of this. In case the yet moist puzzolana were covered by a hot lava stream which allowed evaporation of the water after an energetic action of oxidation on the hydrous oxide of iron, which, at the same time, lost part of its water, the colour of the puzzolana changed to red, and often the part in contact with the hot lava became as hard as a brick. An example of this is the "tetin" of the Azores. The latest Tertiary period produced the best puzzolana now used in mortar. H. Von Dechen* and L. Dresselt accord that the trachytic-leucitic and pumice-stone tuffs of the Laacher See (River Rhine) originated at the end of the Tertiary period and the beginning of the Loess deposits. It may be observed that only trachytic and pumice-stone tuff is fit for mortar purposes, while the leucitic tuff yielded almost no useful result. However, leucituff yields an excellent building-stone, especially for ornamental work, and has been used extensively in churches and other monumental buildings in Germany. The origin of the leucitic tuff is somewhat different from that of the trachytic and pumice-stone tuff, as it is considered not to be ejected, but to flow out from the volcano in a mud steam—Moja. The Italian puzzolana is mostly obtained by digging it from open pits of slight depth; however, very large deposits are also found. That of Trentaremi, furnishing a brown-yellowish puzzolana, is more than 600ft. deep, of great extent and situated immediately on the sea. The average production in 1885 amounted to 100 tons per day. The deposits of the dark gray puzzolana of Santa Maria della Bruna, near Torre Anunciata, on the slope of Mount Vesuvius, is estimated at 2,000,000 tons, and can furnish 150 to 300 tons per day. Comparatively little care is exercised in the selection of the localities from which puzzolana is taken, a matter of great importance, although it is evident that a natural material of this character, the product of successive volcanic eruptions, must vary greatly in its chemical and physical constituents. Besides neglecting the necessary preliminary tests and explorations, the Italian manufacturers have been very careless in the grinding and screening of the puzzolana after it has been excavated, and, as a necessary consequence, the manufactured article varies greatly in quality. The Italian puzzolana, besides being poorly manufactured, is inferior to other puzzolanas, such as are found on the Rhine (Germany) and in the Azores, in the character of the material itself. This want of uniformity in the Italian puzzolana has made the French engineers employ less of it in their marine constructions than they did formerly. Therefore, it is not surprising that Italian puzzolana from Castelmare, imported into the United States by a Boston firm in 1886, proved an entire failure. The Dutch engineers, on the contrary, whose very existence depend on the stability of their hydraulic works, employed "trass" (which is closely allied to the Italian puzzolana, but is selected and manufactured with much greater care), in all their important places, on account of its cheapness and strength. Puzzolana of the Azores is a yellowish to brownish, sometimes greyish, earth-like powder, which is often fine enough to use as a mortar without grinding or screening. "Trass," on the contrary, is a pulverised stone called tuff-stone, which is about as hard as brick, varies in colour from bluish-grey to yellow, and is found as a porous mass, interspersed with pumice-stone. The harder the tuffstone the better its quality. The tuffstone, especially in the valley of Brohl, on the river Rhine, is generally—sometimes up to 100ft.—covered by powdered puzzolana containing much pumice-stone, which is called "mountain trass," and is by far inferior to tuff-stone for mortar purposes. Both puzzolana and trass are the products of the eruptions of former volcanoes, and, although quite different in their physical appearance, they give nearly the same chemical analysis. They also give the best results for hydraulic mortars when the materials have been

found at the original place of deposit, near the volcano from which they were first ejected. General Q. A. Gillmore, in his standard treatise on limes, hydraulic cements, and mortars, makes the following reference to trass and puzzolana: "Trass, or teras.—In the valley of the Rhine, between Mayence and Cologne, and in various localities in Holland, a substance of volcanic origin is found called trass or teras, which has been extensively employed throughout that region, particularly by the Dutch engineers, for the production of hydraulic mortar. It is derived from immense pits or quarries occupying the sites of extinct volcanoes, and enjoys in every particular the distinguishing properties of Italian puzzolana, closely resembling it in its composition and in the details of its manipulation, requiring to be pulverised and combined with rich lime in order to render it fit for use, and to develop any of its hydraulic properties." The above description of the trass and puzzolana is substantially correct, except that General Gillmore should have said "between Coblenz and Cologne," instead of Mayence and Cologne, and should have omitted the words "in various localities in Holland," as no trass is found in Holland unless it is imported from the above-named locality in Germany. The following analysis shows how much trass and puzzolana resemble each other, and also that the chief ingredients are silica, alumina, and iron oxide. The proper amount of lime that is necessary to use with puzzolana and trass mortars varies with the character of the work and the quality of the puzzolana and lime. Mortar composed by volume of one part each of puzzolana, powdered lime, and sand probably gives better results than any other combination of these materials, although larger proportions of lime and sand may be used where great strength is not required. At the great harbour improvements at Kiel (Holstein) the following mixture was adopted:—

3 Volumes of trass.
2 Volumes of fat lime paste.
7 Volumes of sand.

In Holland the following composition is the standard for the hydraulic works:—

	Trass.	Shell Lime Paste.	Sand.	Stones.
	Vols.	Vols.	Vols.	Vols.
Strong Trass Mortar	1	1	—	—
Second Quality	2	4	1	—
Third Quality	2	6	3 $\frac{1}{2}$	—
Concrete	1	1	—	1 $\frac{3}{4}$ to 1 $\frac{1}{2}$

In the United States the ordinary market limes make, when mixed with puzzolana, very strong mortars; some of the best results having been obtained with common Rockland lime. The lime should be slaked with about 40 per cent., by weight, of water, two or three days before mixing with the puzzolana, to give the unslaked particles a chance to be air-slaked. General Gillmore, in his work on limes above referred to, says: "Experiments seem to prove that fat lime slaked to powder will give better mortars with trass and sand, or with trass alone, if left exposed to the air for a month or more after slaking, than if made into mortar when perfectly fresh." After the lime has been slaked it should be screened through a sieve of 400 meshes per square inch. Of course, other kinds of lime may be used just as well in puzzolana mortar. The right proportions of the mixture should be ascertained by previous experiments. Unlike cement mortars, which have to be used soon after mixing, the puzzolana and trass, after the lime, sand, and water are added to them in the proper proportions, can be left at least 24 hours undisturbed, and be worked over just before using, without injuring the quality of the resulting mortars. This is of great advantage in building operations, inasmuch as the quantity of the mortar for each day's work does not have to be so accurately determined. As trass and puzzolana commence to harden only after the addition of the lime, they can be stored even in damp places for any length of time without deteriorating in the slightest degree. Trass that had been kept exposed to the atmosphere for three years, and which was then mixed with one volume each of powdered lime and sand, gave a tensile strength at the end of five months of 204lb. per square inch. This quality makes it possible to export trass and puzzolana without risk, whereas with Portland cement great trouble is experienced in the ocean voyage, either from dampness or overheating, and the cargo rarely

Loss	0.35	0.31	0.80	0.40	0.70	0.40		0.33	5.78	0.55	0.30	0.22

In the above analysis, all that is lacking to make a good material for hydraulic mortar is the lime, and this is therefore added to with sand.

arrives in as good condition as it was when shipped. The ability to keep puzzolana and trass also enables the engineer to carry on large works more advantageously, as he is not obliged to estimate so closely the quantity of cement required for each piece, and he can make better arrangements in regard to its purchase and storage. To get a Portland cement mortar of equivalent strength to the puzzolana, and near the price of it, large quantities of sand must be added. This brings up the question of the weakening effect of certain sands upon cement mortar, and, from some very carefully-made German experiments, we find that the same cement mixed with fine and impure sands can lose two-thirds of its strength. The bad effect of the inferior sand upon a puzzolana mortar would be less in proportion to the smaller amount of sand used. Puzzolana and trass mortars form very little "laitance" as compared with cement mortars, a very desirable quality when laying concrete in mass, under water, where cement mortars tend to separate in layers, according to the specific gravities of the component parts. This is not the case when puzzolana or trass is used. The change of volume, either contraction or expansion, so common with cement mortars, is not observable with puzzolana or trass when the lime is perfectly slaked. The following table, in which the quantities have been determined by very careful measurements, will enable anyone to calculate for himself the relative economy of using puzzolana and trass mortars in preference to either Portland or Rosendale cement. The weights of the three cements and of the lime and sand were obtained by filling a litre with each material, and shaking the measure as they were poured in, until the litre would hold no more, thus insuring absolute compactness.

TABLE A.

	Weight: Kilograms.	Amount of Water absorbed: Litres.	Amount of Space occupied by Solid Material in one Litre.	Space occupied by each Metre of Mortar: Litres.
Portland Cement	1.63	0.480	0.520	520
Rosendale Cement	1.40	0.500	0.500	500
Puzzolana or Trass	1.25	0.370	0.630	630
Sand	1.70	0.350	0.650	650
Powder or Slaked Fat Lime	0.72	0.600	0.400	400

TABLE B.

AVERAGE PRICES OF MORTAR MATERIALS IN NEW YORK.

Weights.	Cost. Dols.	One Cubic Metre contains Kilo.	Cost. Dols.
Portland Cement 1 bbl. net, 170 Kilo.	2.15	1630	20.61
Rosendale " 1 " " 136.2 "	1.00	1400	10.27
Puzzolana or Trass " 1 " " 1250 "		1250	10.00
Fat Lime " 1 " " 136.2 "	0.70		
Slaked to Powder = 2.25 vol.		720	1.65
Sand " 1 c.yd. 1315.0 "	0.65	1700	.87

Tables A and B may be changed by substituting for the weights of the materials when compacted, the weights of the same when poured loosely into the measuring vessel—as, for example, the standard weights per struck bushel when measured by falling from a hopper placed at a uniform height. But this change will not affect the results shown in Table C relatively for the

three cements. The tensile strength for Portland and Rosendale mortars, given in the last column of Table C, is taken from Mr. Eliot C. Clarke's paper printed in the *Transactions of the American Society of Civil Engineers*, published in April, 1885. It was compiled from about 25,000 breakings of 20 different brands, and fairly represents the average strength of ordinary good cements of

	1	1	0.750	1.65	11.94	6.73	5.13	116
Puzzolana or Trass	1	1	0.750	2.43	12.49	4.69	3.59	60
	1	1.5	0.875	2.83	12.91	5.14	3.92	200
	1	2	1.000	3.33	13.33	4.45	3.33	187

the two kinds. The amount of water used was just sufficient to make a plastic mortar, somewhat stiffer than is commonly used by masons, about 25 per cent. for neat Portland and 33 per cent. for neat Rosendale. The amount of water used by Mr. Clarke in his experiments being about the same as was used with the puzzolana mortars, enables us to make a fair comparison. If less water had been used, all the above figures would be more. Mixed with 20 per cent. water, puzzolana mortars composed of one volume each of puzzolana, lime, and sand, 28 days old, break at more than 200lb. per square inch. The following tables give a summary of results in regard to the proportion of the compressive strength compared with the tensile strength, the latter being admitted at 100. The mixtures are made by volume.

Puzzolana or Trass.	Fat Lime.	Sand.	Compressive Strength.
1	1	1	683
1	1	2	732
1	1	3	826
1	1	4	810

With slow-setting cement treated in the same standard manner, the results were:

Cement.	Lime.	Sand.	Compressive Strength.
1	—	1	825
1	—	2	822
1	—	3	789
1	—	4	808
1	1	6	770

The above figures prove clearly that puzzolana or trass mortar shows better proportions of compressive strength to tensile strength when a larger amount of sand is added, so as, by diminishing its plasticity, to render it more similar to cement mortar, and consequently be struck into the testing mould like cement mortar. While the air cannot escape as easily from the fat puzzolana or trass mortar as from the cement mortar, the density of the test cube, and consequently the strength, is diminished in a proportion which averages 98:100. Therefore, in practical work, where no ramming of the mortar takes place, the result will, in proportion, be more advantageous with puzzolana or trass mortar than with cement mortar. To test the density or impermeability to water, circular conical discs of 20 square centimetres surface at the smallest face, and 15 millimetres thick are made of standard mortar, and immersed in water to harden, the

same as for tensile-strength test. By means of a rubber ring the hardened disc is tightly fitted into a cylinder in such a manner as to produce by an air-pump a vacuum in the lower part of the cylinder underneath the mortar disc, while water is filled in the upper part of the cylinder, on top of the mortar disc. The water thus effects a pressure of one atmosphere upon the mortar disc. After 24 hours the percolated water is carefully collected and weighed. Results:—1. The mixture being made by volume, the fat lime slaked to paste, and the mortar discs hardened for six weeks under water:—

Trass or Puzzolana.	Fat Lime.	Sand.	Water.	Water-pressed Trough. Grammes.
2	1	0	0.180	0.00
1	1	1	0.150	0.03
1	1	1	0.075	0.10
1	1	1	0.000	0.14
1	1	2	0.150	0.14
1	1	2	0.050	0.06
1	1	2	0.200	0.01
1	1	3	0.075	0.59
1	1	3	0.200	0.29
1	1	3	0.300	0.10
1	1	4	0.050	0.66

2. The fat lime being slaked to powder and the mortar disc hardened for four weeks under water.

Trass or Puzzolana.	Fat Lime.	Sand.	Water.	Water-pressed Trough. Grammes.
2	1	0	0.800	0.10
1	1	1	0.450	1.15
1	1	1	0.500	0.25
1	1	1	0.550	0.15
1	1	1	0.600	0.07

To surpass the quantity of water of the last mixture would be injurious, as the quantity of water and lime is of essential influence to the density of the mortar. Cement-sand mortars thinned as in practical use are less dense, because the cement does not fill up as perfectly the spaces between the particles of the sand as is the case with puzzolana or trass and lime in puzzolana or trass mortars. Slow-setting cement of standard tensile strength and standard mixture, after four weeks' hardening under water, transmitted 1.25 grammes of water, and mixtures of—

Cement.	Lime.	Sands.
1	—	4
1	—	4
1	1	6

treated in the same manner transmitted all of the water. To Dutch and German engineers these

treated in the same manner transmitted all of the water. To Dutch and German engineers these well-known facts have been of decisive importance in many of their large works, especially in the construction of sluices and basins. The adhesive strength of mortar to stone is of great importance, especially in concrete. In the following table the figures of adhesion have been established in connection with the compressive

Mortar Mixture by Volume.			Water.	Proportion of the Adhesive Strength of the Concrete.
Puzzolana or Trass.	Fat Lime Paste.	Sand.		
2	1	0	0.180	108
1	1	1	0.150	101
1	1	1	0.075	121
1	1	1	0.000	115
1	2	2	0.150	109
1	1	2	0.050	126
1	1	3	0.100	90
1	1½	3	0.075	109
1½	1	3	0.050	95
1	1½	4	0.100	73
1	1½	4	0.050	78

strength, which is taken at 100. The test specimens are prepared in the same manner as for compression tests. As bricks show too great a difference between themselves, congenerous basalt

pieces have been used for the concrete. To one volume of ready mortar, two volumes of basalt pieces have been added, after they had been immersed in water for some time. The specimens were left to harden under water for six weeks. The mortars with more lime show mostly higher proportional figures in concrete than those with less lime. Therefore, a larger addition of lime should be made to mortar used in concrete than to that used without stones. While up to the admixture of two volumes of sand the concretes show higher strength than the mortars without stones, the adhesive strength decreases with larger additions of sand in such a manner that it does not even reach the strength of the mortar without stones. By this it is easily understood that cement mortars with much sand (as generally used, 1 volume of cement and at least 3 volumes of sand) attain by far inferior strength in concrete than the same cement mortars would show without stones. These differences in strength ought to be greater with cement mortars than with puzzolana or trass mortars, because, in consequence of their greater density, the puzzolana and trass mortars have more points of contact with the admixed stones than the more porous cement mortars. Adhesion tests with cement mortars made into concrete and treated in the same manner as with puzzolana and trass mortars gave the following results:—

Cement.	Lime.	Sand.	Proportion of the Adhesive Strength of the Concrete.
1	1	3	76 : 100
1	1	4	62 : 100
1	1	4	72 : 100
1	1	6	95 : 100

For the valuation of the mortar materials it surely merits consideration that in most of the mortar mixtures used in concrete works puzzolana and trass mortars yield a higher strength by the addition of the stones, while the more porous cement mortars show a much more inferior strength, as is found by the usual test of the mortar without stones. As no large structure can be executed without interruption, the joining of the separate layers of mortar is of special importance. The more or less perfect junction of already hardened to freshly-applied mortar is not dependent upon the final hardening of the mortar, but rather upon its adhesive capacity. Experiments in that line have been made as follows:—Specimens made as for tensile-strength tests were at once immersed in water. After 24, 36, &c., hours some of them were taken out of the water and divided into halves, while the other specimens remained under water to ascertain later their tensile strength. Each of the halves were put again into a mould, and the remaining empty If of the mould fill up again with fresh mortar, fully pressed to the old half specimen and re-pressed at once. The cement used for this test, according to standard test, left one day in the air, showed 16·85 kilos tensile strength. The less strength stated in the following table is caused by the necessary immediate immersion of the specimens.

TABLE I.

Mixture.	Medium Temp. of Water.	Tensile Strength after 28 days. Kilos per Square Centimetre.	
		Regular Specimens.	Specimens joined after 24 hours.
1 Trass, 1½ Fat Lime Paste, 3 Sand, without water	10½° C.	15·00	12·00
Cement, Standard Mixture	19½° C.	11·25	6·25
This answers the proportion of:—			
Trass-Puzzolana Mortar		100 : 80	
Cement Mortar		100 : 55	

TABLE II.

Mixture.	Temp.	Regular Specimens.	Joined after 36 hours.
Trass, the same as in Table I.	15½° C.	13·25	9·25
1 Trass, 1 Fat Lime Paste, 1 Sand, and 5 per cent. Water	15° C.	14·50	11·00
Cement, Standard Mixture	15° C.	9·50	4·00
This answers the proportion of:—			
Trass Mortar	1½:1	100 : 70	
Trass Mortar	1:1	100 : 77	
Cement Mortar	—	100 : 42	

That trass or puzzolana mortar, even after so long an interruption of the work, makes as perfect

a junction as shown by the table, is certainly very important, and the only guarantee for impermeable masonry. It is more important yet with concrete work under water. Usual cement mortars often form very much "laitance," which has to be removed before a new concrete may be put on. As the formation of "laitance" is but a consequence of decomposition of the mortar, it ought to diminish the hydraulic properties of the mortar. With the plastic trass or puzzolana mortars, such decomposition and formation of "laitance" is almost unknown. Hardening under sea-water is by no means injurious to puzzolana or trass mortar. Even much higher strength is obtained than when hardening in soft water. This has been stated in many maritime works by the Governments of Germany, Holland, Portugal, &c. Taking the tensile strength of the mortar hardened in soft water at 100, the same mortar hardened in sea-water showed the following results:—

Trass.	Fat Lime Paste.	Sand.	After 28 days hardening.
2 parts	1 part	— by weight	111
1 part	1 part	1 part by weight	169
1 part	1 part	2 parts volume	132

At the Polytechnicum in Delft, Holland, tests were made by Professor van der Kloes, at the pretty low temperature of 7·9° C., yielding an average tensile strength after one month's hardening, with 2 parts trass and 1 part of fat lime:—

In soft water.	In sea-water.
7·84 kilos.	10·56 kilos. per square centimetre
That means a proportion of:—	100 : 135

Trass has been used in the construction of most bridges over the Rhine, Weser, and Elbe, at the maritime works of the German Government, and especially in Holland and Belgium, the docks at Antwerp having required 60,000 tons. Trass was also used in building the large aqueduct that supplies the city of Verviers, including the enormous masonry dam, "le barrage de la Gileppe," in Belgium, about twenty-five years ago. To show how trass and puzzolana can hold their own as competitors with Portland cements may be mentioned the fact that when, about fifteen years ago, it was found necessary to build some hydraulic works, sluices, &c., for the improvement of the River Main, in close proximity to the celebrated Portland cement works of Dyckerhoff and Schifferdecker, trass was selected as the material to be used on account of its strength and cheapness, although it had to be brought about three hundred miles. Large contracts have been made for supplying the Chinese Government with trass manufactured by D. Zervas' Sons, Cologne, Germany, owners of extensive tuffstone quarries and trass mills near Andernach, Krufft, and Brohl. According to the official reports of the Board of Trade in Lisbon, puzzolana was imported from San Miguel, Azores Islands, to Portugal, in 1801, and was there used with great success in the erection of important buildings. Of late years this puzzolana has been used with great satisfaction in the following railroad constructions:—East Railroad, South Railroad, and Central Railroad; in the harbours, docks, and bridges in Porto, Lisbon, Ponta Delgada, &c.; also in the hospital, aqueduct, and reservoir, together with many other structures in Lisbon and other cities in Portugal. In the harbour and dock works of Figueira, which required over five years to finish, the mortar was: one volume puzzolana, one volume Alcantara lime, and one volume sand. This mortar got so hard that fire was produced when it was struck with a hammer. Trass and puzzolana have as yet rarely been used within the United States, probably because they have not been advertised enough. A few small works made with puzzolana of the Azores produced excellent results, even under very unfavourable circumstances. It may be proper at this point to mention one report in regard to this. Mr. Henry S. Kearney, Chief Engineer of the Board of Electrical Control in New York, says in his letter of September 2, 1887, "I can state that I put the concrete made of puzzolana in last fall in Green Point for foundation of a large engine, which has been running very satisfactorily since last spring. As I have not had any occasion to inspect it, there being no complaint, I can say that it is satisfactory. I consider the time (November and December) when concrete was placed, being very unfavourable, and my not being troubled since the engine has been running, a very satisfactory test and very much in favour of the cement and its future use." The writer of this article inspected the work mentioned. The block containing over fifty cubic yards was as solid

as a monolith. The place where the block had to be put in was swampy, subjected to the effect of ebb and flood, and the foundation secured by but a small pile work. The weather was so cold that every morning a solid ice cover had to be removed from the work-pit to put the concrete in, and the concrete—consisting of 1 volume of Puzzolana from the Azores, 1 volume of Rockland lime slaked to powder, 1½ volume of concrete stones—had to be used at once after mixing to prevent its freezing. All other cement-work at the place had to be stopped on account of the great cold. Some smaller puzzolana concrete works at the same place showed all the same perfection. Up to the present time real puzzolana has not yet been discovered within the United States, where the geological conditions offer little expectation in that regard.

HYDRAULIC LIMES.

As the hydraulicity of lime depends chiefly on the presence of silicate of alumina or clay—the more clay, within a certain degree, the more hydraulic the mortar becomes. Thus, up to 10 per cent. of clay the limes are feebly hydraulic; up to 20 per cent. they are ordinarily so, and up to 30 per cent. eminently hydraulic, so that the lime will set under water. Amongst the best limes for setting under water are those called grey stone limes, which come from Dorking, Merstham, and Guildford. Thus the admixture of clay will often be found to improve the water-setting properties. Ordinary hydraulic limes harden under water in from six to eight days, while those of the latter class, which contain most clay, harden in from one to four days. One important point is the slaking of these limes. The more hydraulic they are, the more sluggish the slaking is. Hence, hydraulic works often burst from the slaking of the lime which has not been properly prepared for its use. It should be all hydrated before placing, and this requires more time than ordinary lime. The "fat" limes, on the other hand, slake fiercely, as they contain nearly pure carbonate of lime; they develop also great heat and steam. They fall into a bulky powder, and possess little setting power, being slowly soluble in water. For waterworks, in which rapid setting is necessary, Frenssalt found this concrete mixture excellent: 30 parts of hydraulic lime, measured in bulk, and before being slaked; 30 parts of Terras of Andernach, 30 parts of sand, 20 parts gravel, and 40 parts of broken stone, a hard limestone.

EBURITE FAIENCE.

At the new General Hospital, Birmingham, the opening of which we recorded last week, a noticeable feature is the decoration of the out-patients' waiting-hall, which is carried out in "Eburite Faience," a unique treatment introduced by Mr. Alfred Whitehead, of 35 and 36, Prudential Buildings, Park-row, Leeds, who was many years chief designer and architect to the Burmantofts Works.

The treatment of the hall referred to consists of dados carried round the room and round the columns in rich brown glazed majolica ware, the whole of the upper part of the rooms, columns, and arches being treated with Eburite Faience in various shades of ivory and light brown, relieved with a few bright majolica bands. This Eburite Faience is a speciality prepared for Mr. Whitehead by Mr. John Campbell, the Campbell Tile Co., Stoke-on-Trent, and this is the first instance in which Mr. Whitehead has used it. The effect seems to give extreme satisfaction to all who have seen it. It is a dull or egg-shell glazed material, and the general impression in cream colours gives the effect of old ivory, which is a very pleasing departure from the glitter of the majolica ware generally in use. The room is 46ft. wide by 95ft. long, with aisles on either side and a nave arcade consisting of six bays spanned by flat segmental arches filled in with ornamental spandrels and cornice over, above which are clerestory lights. From this hall branch off the doctors' and patients' entrances into the quadrangle of the main building, each 10ft. wide. The whole of the work has been prepared and carried out under Mr. Whitehead's contract and direction, and is well worth inspection by all interested.

A new organ for Mill Hill School, the gift of Sir W. H. Wills, Bart., M.P., is being built by Messrs. Vowles and Co., of Bristol.

LAND TITLE AND TRUST COMPANY'S OFFICE, PHILADELPHIA.

PROPOSED OFFICE BUILDING FOR THE LAND TITLE AND TRUST COMPANY, PHILADELPHIA.

WE are indebted to the *American Architect* for this illustration of a competitive design, prepared by Messrs. Kennedy, Hays, and Kelsey, architects, of Philadelphia, Pa., U.S.A., for the new offices of the Land Title and Trust Company, to be erected in that city.

THE PARK HOSPITAL, HITHER GREEN.

THE formal opening of the Park Hospital, Hither Green, near Lewisham, by the Prince and Princess of Wales on Monday afternoon last, brings into public notice a building, or rather group of buildings, of exceptional importance, and one of the largest infectious hospitals in the kingdom. It is the ninth hospital erected by the managers of the Metropolitan Asylums District for the reception of patients of the parishes and unions of the Metropolis. The Park Hospital is situated on elevated ground near Hither Green Station on the South-Eastern Railway, and about a mile from Lewisham. Its average level is about 95ft. above high-water mark, but the land slopes about 30ft. from east to west, and nearly as much from north to south, an inclination which has been taken advantage of in the planning of the pavilions, of which there are 18. We gave a general view of these and a description in the *BUILDING NEWS* of November 20, 1896, from which our readers will see the general distribution of the buildings on the site. There are eight two-storied pavilions for scarlet fever, four for enteric or diphtheria patients, and six isolation pavilions for other cases. These cover an area of 20 acres, or about two and a half times the area of St. Thomas's Hospital. Externally the buildings are of stock brick relieved by red brick and red terracotta. The scarlet-fever cases are provided for in 48 wards for 368 patients, diphtheria and enteric fever in 24 wards for 120 patients, and 36 isolation in wards for 60 patients, making a total of 548 beds for patients. The scarlet-fever pavilions are on the right or west side, the diphtheria and enteric fever wards on the east, and the isolation blocks in the south or rear. In the centre are the one-story kitchen block and administration buildings; these are connected to the pavilions by covered ways. The steward's stores, water tower, dispensary, and telephone exchange, and the servant's residences are in the centre. The latter face the road. The laundry, boiler, and engine-houses, workshops, and disinfecting house are at the south-east corner, and the medical superintendent's house is at the right-hand of main entrance on the north side. The is also between the two entrance-roads, a discharging-room and mortuary, &c., are on the left-hand side of entrance. The steward's house also commands the entrance to the stores and kitchen yard. The number of staff accommodated is 316, including the medical superintendent, assistant medical officers, of which there are 5, matron and housekeeper, nurses (191), domestic servants (90), and other servants.

The pavilions are axially arranged nearly north and south, and all of two stories, and have fire- and sound-proof floors; there is no internal communication between the two floors, the upper floor being reached by an external staircase opening from the covered ways. Lifts are provided at each staircase for coals, food-trolleys, &c. From the plan it will be seen the nurses' home is in the rear on the south-west, the highest point. The covered ways are arched and open, and connect all the buildings, and are constructed of brick and concrete, the floors and steps of red granolithic concrete; under them are subways for water and steam mains and heaters, electric light, telephone, &c., and all these are accessible. We notice also that below the ground-floor ward of every pavilion there is a low-arched space for ventilation. Each scarlet-fever pavilion has on each floor three wards, one for twenty beds (120ft. long), one for two beds, and a single-bedded ward, a ward scullery with hot-plate kitcheners, sink, &c., and other offices, a bath-room, two w.c.'s for patients and one for staff; sink-room, two bed-pan slop-sinks, lavatories, and movable baths. A few details deserve notice. Hot-water radiators are employed in cases designed to admit fresh air, which enters warmed into the ward at a slow velocity, calculated to change the air in each ward three times

per hour. Inlets for fresh air are provided, and admit of adjustment. Each ward has two central open fireplaces, and stacks of flues designed by the architect, every flue of which can be swept from the external basement. These flues are surrounded by aspirating flues, which produce an up-current, and draw off the vitiated air of ward. Externally, the stacks are made of blue-green faience, and make pleasing breaks in the wards. There are eight air-flues and four smoke-flues in each stack, which is 3ft. 6in. square on plan. All pipes are accessible. The windows are sliding sash below, and open lights falling inwards above. Some of the buildings have a specially-designed window by the architect. There are no hollow linings; the frame is solid, but the sashes slide, and are made to open inwards to throw the air upwards. They can be regulated to any angle, and can be opened to admit air through the full area of the frame—i.e., double the area of an ordinary sash-window; the weights and sash-lines can be removed without taking the sashes out, and the linings are made to open for sweeping. These windows can be cleaned, painted, and reglazed from the inside—very desirable points. The laundry is in two parts for patients and staff; the soiled linen enters at one end, and passes through several cleansing processes to the distributing room at the other end. The disinfecter is at the entrance to laundry-yard, and is fitted with Lyon's apparatus. The water supply is from wells in the chalk, and the water-tower in the centre, with a four-dial clock, forms a feature seen in our view. We may note that the kitchen block is internally faced with glass, making a clean and bright surface. Internally the wards present a light and cheerful appearance; the floors are close boarded with teak, the walls are cemented and painted of two colours, a dala of dark chocolate, having a glazed and washable surface, and all the angles between floor and walls are rounded off in cement. We can only briefly refer to the other buildings. The female servants' block has a separate cubicle for each maid, large mess and sitting-rooms, and a separate flat of rooms for the matron. The nurses home, on the south-west, is divided into three houses, connected with iron and glass corridors on each floor; each nurse has her own bedroom, and separate dining and sitting-rooms are provided for charge and assistant nurses. The w.c.'s and lavatories are in detached towers as in the pavilions. Mr. Edwin T. Hall, F.R.I.B.A. and F.S.I., is the architect, and his plan was selected in public competition in 1894. Mr. Hall has personally supervised every detail of this extensive range of buildings. He has been ably assisted by Mr. Turner, the chief clerk of works, and Mr. Mansell, assistant clerk of works. Messrs. Leslie and Co., Ltd., of Kensington, are the contractors, and the contract amount is £210,000. The work has been well carried out under the personal supervision of Mr. Shingleton, assisted by his manager Mr. Kitchener, and the ground foreman of the works, Mr. Easter.

THE SEPTIC TANK SYSTEM OF SEWAGE TREATMENT.

THE particulars we gave last week of this system have elicited several inquiries which will be probably found answered in the following paper, which was lately read before the Devon and Exeter Architectural Society by the originator of the system, Mr. Donald Cameron, the city surveyor of Exeter:—After enumerating the various methods of dealing with sewage and pointing out their drawbacks and failures, the lecturer proceeded to say that "such considerations as these forced me to the conclusion that no system of treating sewage can be satisfactory which does not follow as closely as possible the lines laid down by nature. I therefore set myself to devise a system in which the work of natural agents should be forwarded to the fullest extent. For many years past, in such leisure as I could snatch from the duties of a very exacting position, I have devoted myself to researches and experiments with a view to ascertain what conditions would best further the desired object. Of this work the septic tank is the outcome. In this system no chemicals are employed, and there is no "treatment" of the sewage in the ordinary sense of the term, its purification being accomplished entirely by natural agencies. The septic tank itself is merely a receptacle designed to favour the multiplication of micro-organisms, and bring the whole

of the sewage under their influence. To this end the tank is of ample size, though not larger than would be necessary with chemical precipitation, and covered so as to exclude light, and, as far as possible, air. The incoming sewage is delivered below the water level; and the outlet also is submerged, with the two-fold object of trapping out air and avoiding disturbance of the upper part of the contents of the tank. On entering the still water of the tank the solids suspended in the sewage are to a great extent disengaged, going either to the bottom or to the surface, according to their specific gravity. In the absence of light and air the organisms originally present in the sewage increase enormously, and rapidly attack all the organic matter. By their action the more complex organic substances are converted into simpler compounds; and these in turn are reduced to still simpler forms, the ultimate products of the decomposition in the tank being water, ammonia, and carbonic acid and other gases. Other nitrogenous compounds may also be present, but they will all be soluble in a slightly alkaline solution—a condition which obtains with every normal sewage. No sludge is found. Examination of the bottom of a tank which has been in use for six months reveals only a thin layer of black earthy matter—the burnt-out ash of the solids of the sewage—together with the mud and grit brought down by storm water. So far as accumulation at the bottom is concerned, it would seem that a tank may be used for an indefinite time without requiring to be cleared. The larger part of the solids in the tank are found at the top, where a somewhat tenacious scum soon forms, consisting of the lighter solids in process of decomposition. After a tank has been a short time at work, the scum increases in thickness very slowly. In one case after thirteen months' work, the scum was only a few inches thick. The effluent from the tank is comparatively clear and inoffensive, and not liable to any after fermentation, the work of decomposition being already done. In this state there can be no reasonable objection to its discharge into tidal water. It is eminently fitted for utilisation on land, containing as it does all the constituents of the sewage having any manurial value in a form immediately available as food for plants; while its freedom from suspended matter removes the difficulty met with in irrigation with crude sewage. It is also in a fit state for filtration. The filtration of sewage or sewage effluent is not a mere straining action; if it were so, the filters would soon clog and become useless. Moreover, the effluent from the septic tank, being free from solids, is not susceptible of improvement by straining. The work to be done consists in the oxidation of the ammonia formed in the tank; this is thus converted into nitric acid, which at once combines with the bases present to form nitrates. This oxidation, like the previous decomposition, is the work of micro-organisms, but of a kind totally different from those which operate in the tank. The latter are largely of the species classed as anaerobic, living in the absence of air and light, and exercising in many cases a reducing or deoxidising action. The organisms which work in the filter, on the other hand, are aerobic, the presence of oxygen being absolutely necessary for their life and work. Consequently the conditions prevailing in the tank must be reversed in the filter, to which oxygen must be freely supplied. To this end the filters are best constructed of some porous material, such as coke breeze or crushed furnace clinker, affording abundant interstitial space. Furthermore, as has been shown by experiments made, filtration must not be continuous, or the oxygen contained in the filter will soon be consumed, when the nitrifying organisms will die off, rendering the filter useless until new colonies shall be formed. Filtration, therefore, must be intermittent, a change of air being supplied to the filter after every dose of effluent. It is found that a filter worked in this way retains its purifying power for an indefinite period. In my system attendance is altogether dispensed with, an arrangement being adopted whereby the filters are filled and discharged automatically. In a small plant, the filtering area may be divided into two parts, each of which would be filled in turn while the other is emptying and at rest. The action of the alternating gear is as follows:—The supply of effluent to each filter and the discharge of the clear water after filtration are controlled by valves, all connected to one rocking-shaft. The clear water from each

filter passes into a bed of gravel underlying it, from which it is led by drains into a collecting well. As the effluent fills the filter, the clear water rises in the collecting well, and the filter becomes full, a small quantity of clear water overflows from the collecting well into a bucket carried by the shaft. The water thus thrown into the bucket bears it down, rocking the shaft, and thereby actuates all the valves. The flow of effluent to the filter already full is stopped and its discharge-valve opened, the effluent being turned on to the empty filter, whose discharge-valve is at the same time shut down. The water rushing out from the filter last in use draws down after it through the filtering material the charge of air required for dealing with the next dose of effluent. When the bucket which rocks the shaft sinks into its lower position, its contents are discharged through a counterbalance chamber, in which a part of the water remains to hold the valves in place until the other filter shall be full. The overflow from this second filter passes into another bucket, which was raised into position by the sinking of the first, and by means of which the valves are brought back into their original position. The first working installation consisted of a small tank only, which dealt with the sewage of over thirty houses, as well as that of a large reformatory. It also received a considerable amount of storm water. This tank was in use for thirteen months, during which it gave a uniformly clear effluent. At no time was any solid matter taken out of it, nor did it require cleaning at the end of the period. The fitness of this tank for its work having thus been demonstrated, a second plant was laid down to deal with the sewage of over 300 persons, ranging from 7,500 to 10,000 gallons daily. In addition to the tank, two coke breeze filters were provided, having a united area of about one-hundredth of an acre, and furnished with the alternating gear before described. The gratifying experience gained with the first tank has been confirmed by the second, while the uniformly good results given by the filters show how completely the tank does its work of preparing the sewage for filtration. The filtered effluent is quite free from smell, and in the bulk of a large tumbler shows the merest trace of colour. It is often absolutely colourless. Analyses show that it comes up to the exacting standard of purity laid down by the Rivers Pollution Commission. These results were somewhat unexpected, seeing that a two-filter plant does not admit of the period of rest after filling and before discharging which has been regarded as necessary. In view of the results thus obtained, the Exeter City Council, guided by the reports of chemical and bacteriological experts, have adopted the septic tank system for the disposal of the sewage of the whole city, subject to the sanction of the Local Government Board; and plans of the proposed works are now in hand. For the more complete demonstration of the capabilities of the system the council have constructed a larger plant to deal with the whole flow of one of their outfall sewers, amounting to 90,000 gal. per day. This installation consists of a tank 64ft. by 18ft., ranging in depth from 7ft. to 10ft., with five filters 5ft. deep, filled with coke breeze and furnace clinker, and having a total area of 400 square yards. One filter will always be held in reserve, the four others being worked in one cycle, in the same way as the two-filter plant already described. By having four filters in a set instead of two, it becomes possible to give each filter a period of rest after filling before it is emptied, and a period for more complete aeration after each discharge. Instead of straining off the floating solids and intercepting the road-grit outside the tank, it was decided to turn into it all the solids brought down by the sewer, so as to place it under exceptionally severe conditions. The only outlet is the effluent discharge pipe 6ft. above the bottom, there being no other avenue by which either solids or liquids can escape from the tank. The foregoing description deals only with the main features of the system, passing over those minor details which do not affect its fundamental principles, though they are none the less necessary for insuring constant and reliable working. The tank is protected by patent, and a patent for the alternating gear has been applied for. In the matter of cost, the advantage of the septic tank system is not less marked than in that of efficiency. The capacity of tanks and filters required is not greater than with chemical processes, and the whole cost of machinery for preparing chemicals, agitating and

FIG. 135

FIG. 136

FIG. 137

dealing with the sludge, and buildings for its accommodation and for storage of sludge, is saved. The only additional item of cost with the septic tank system is the alternating gear, the valves themselves being common to both systems. The annual cost of working is practically nil. Not the least advantage of the system is its power of dealing temporarily with volumes of sewage far in excess of the normal capacity of the plant, a feature which renders it possible to

bracings and of stiffeners, and that a limit is soon reached, at which it becomes more economical to adopt other designs. Flat bars occur as ties in many of the largest girders, but they are only used as struts in small ones. They lack the stiffness necessary to enable them to resist crippling tendencies; they are often increased in number and riveted at their crossings; but the best practice is to use other sections, such as angles and ties for struts. With increase in length, which involves

FIG. 138.

abandon the risky expedient of discharging slightly-diluted sewage without treatment whenever the volume of dry-weather flow is slightly exceeded. With this system the difficulty often experienced in finding a suitable site for works of sewage disposal is reduced to a minimum, for a septic tank plant can be placed in situations where a plant on any other system would be impracticable."

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXIV.

THE struts and ties, simple in the smaller girders, become more elaborate and complex in the larger. The elements in the simplest

increase in depth, flat bars are reserved for members in tension only, or are not used at all. Flat bars are not suited for withstanding compressive stresses because they are too weak sideways, or, in other words, the moments of inertia and of resistance in that direction are of low value; the problem is not merely one of compressive strength per area of cross-section, but one of length relatively to area. Stiffness, equally with strength, is a primary consideration in a strut, strength only in a tie. A tie may be flexible, a strut never; this element of stiffness prevents the initial bending which would cause a weak strut to fail by bending as a beam. It is the element of stiffness which is so difficult to estimate, and for which a practical experience is a safer guide than theo-

FIG. 140.

braced girder are single tee-shaped flanges and flat-bar bracings. It needs but little consideration to see that such a form is ill-suited to stand severe stresses, apart from the addition of other

retical deductions. Though additional security is gained in many cases by riveting ties and struts where they cross; this is only permissible in cross bracing, and cannot be done in a single Warren

triangulation. Neither is the method suitable for deep girders, because the struts, if overstrained, are liable to pull and distort the ties along with themselves. In cases in which a girder is well stiffened vertically by tees, angles, or channels, it will often be the case that flat bars may be used for compression members; but, even then, it is probably better practice not to depend much on the action of the verticals, but to design the compression members for their own proper duty.

The question, therefore, of proportioning compressive members is one which has to be regarded apart from that of tension members, and many are the considerations and devices which arise in

FIG. 139.

connection with this subject. In a simple triangulation it is desirable to have strut sections which are able to resist deflection equally in all directions: that is not quite possible of attainment, but a very near approximation to this condition can often be secured. In crossing-braces this condition is of less importance, because of the riveting together at the crossing sections; but due consideration has nevertheless to be given to the rigidity of all struts however cross-braced. These matters have to be borne in mind if we are to understand the reasons of the various forms given to braces and booms.

The remarks made in a previous article in reference to the moment of inertia of various sections used as columns applies with equal force to the bracing struts of girders. Clearly the circular form, in which I is equal in each direction, is the best possible; but it is not used in this application, because of the practical inconveniences of fitting and riveting circular sections. The flat

FIG. 141.

bar is evidently the worst form possible, because I for this is measured by thickness, or thickness plus some assistance affording by riveting; the sections used, therefore, for heavy bracing are angles, tees, and built-up cruciform and box sections. Neither form possesses a moment of inertia quite alike in all directions; but it is practicable so to proportion sections by accumulating material towards the extremities as to obtain very good results. The differences in width and thickness of angles and tees obtainable permit a very wide range of choice in this respect. An excess of rigidity must always be imparted in such cases; but the limits must be reasonable, or dead weight will be unduly increased. In multiple lattice girders the practice of riveting the ties to the struts where they cross, by shortening the latter as pillars, increases their resisting power, while it also increases the rigidity of both sideways. In very deep trusses the struts are often stiffened by increasing the section about the centre by the riveting-on of extra plates there, or by building up struts having parabolic outlines; the principle is the same as that of increasing the sections of girders towards the centre. In some cases the truss is made of larger cross-section at the centre than at top and bottom by curving the bracing outwards from the flange towards the centre.

The commonest type of compressive member for girders of moderate dimension is the angle; better still is the tie. Either is used alone, or riveted to flat bars; also, it is frequent and good

Fig. 142.

practice to use similar sections for the tension members, so making them stronger than necessary for tensile strength, but making them stiffer and better qualified to reinforce the compression members. We get, therefore, such combinations as tension bars and compression angles, Fig. 135, or tension bars and compression tees, Fig. 136, or tension and compression angles, Fig. 137, or tension and compression tees, or angles riveted to flat bars, or tees riveted to flat bars for compression; these, however, are very simple forms suited only for light girders. In fastening such members together at the point of crossing flat faces should, whenever practicable, be riveted together; no flanged parts then have to be cut. It often happens that it becomes necessary to cut away the portion of a flange at the point of crossing of vertical stiffeners; then the riveting must be sufficient to fix the crossing bars firmly, making that in effect the termination of two short

Fig. 143.

struts in place of a single one of full length. Conditions of fixing have to be borne in mind when deciding on the forms of struts and ties. Simple bars, angles, and tees afford good facilities for this, but when built up into various sections the latter sometimes offer difficulties, and increase cost in fixing.

Bearing in mind previous remarks in reference to the best forms for struts—those, namely, in which the cross-section is as nearly as possible symmetrical about the neutral axis, and in which the largest quantity of metal is massed about the exterior parts—circles and hollow rectangular forms would naturally occur to the mind. Circular sections are not practicable; but the cross and the rectangle, in more or less perfect designs, are as common in the larger girders as bars, angles, and tees are in the smaller. The calculations for these are generally the same as those for long columns, bearing in mind that the least moment of resistance is to be taken.

In Figs. 138–142 various strut sections are shown, beginning with the common angle, and advancing to elaborate sections used on the heaviest girders; continuations of angles with plates make up most of these. The zed-bar, Fig. 139 K, or angles L, or angles and plate M, are frequently used, the outer flanges affording facility for direct attachment to the booms. The forms S and T, Fig. 141, are good. In S bulb angles are riveted to a web-plate, the bulbs affording stiffness where it is most wanted; T is an extension of the same principle, though rather more expensive. The best struts for heavy girders are those in Fig. 142, U to Z. The fault of nearly all the sections in these figures, except the last two, Figs. 141, 142, is that there is unnecessary metal in the centre, which might be massed at the outer portions of the sections with advantage; the best sections are those in the group, Fig. 142, where the metal is massed at the

outer portion, where it is best calculated to resist deflection, precisely as in a column or a beam. These are built on the lines of the wide-flanged channel, and joist, and the rectangle; these not only give good moments of resistance, but they have the great advantage of affording broad faces

Fig. 144.

Fig. 145.

for attachment to the booms, and also for secondary bracing, ties, &c.

Most of the foregoing forms of struts are all shown as solid webbed; but many of them are made with lattice web bracing when dimensions are large and reduction of dead weight is a consideration of importance; C, D, H, J, V, X, Y, Z are thus braced. Fig. 143 shows a braced strut in section, single angles only uniting single bracing only and flanges; and Figs. 144, 145 show two types of double bracing united to T-shaped flanges. The first is similar to a Warren girder, the second is of the lattice type; such forms are among the most frequent.

J. H.

STENCILLED DECORATION.

DECORATIVE fabrics are well known to most architects; but those who wish to see a decidedly artistic departure, in which the

process of stencilling is made to conduce to decorative effects, cannot do better than pay a visit to the new show-rooms of Messrs. Aldam Heaton and Co., Ltd., designers and decorators, at 89, Mount-street, Grosvenor-square. In these spacious and well-lighted show-rooms one can discern the truly artistic in many handicrafts. The very idea of a stencilled design was at one time to conjure up in the mind everything that was crude in colour, mechanical and monotonous in pattern; but Messrs. Aldam Heaton and Co. have, by a novel process of their own, given life and beauty to the method. For some years they have been applying the stencil to wall-papers, and other fabrics, with remarkable results. The first experiment made was to wall-papers, and by the use of tertiary and graduated colours, applied to a plain tinted paper or under-print, a very pleasing effect was obtained in shaded tones of colour, and very beautiful gradations, as varied as those of Nature herself. Several of these papers may be seen in Messrs. Aldam Heaton's showrooms, one in very delicate shades of rich colour of a bold Italian design, adapted for a drawing-room; others are of tertiary tones, on greyish or cream-like under-prints stencilled over, through which the print of the ground appears, giving a very rich and delicate effect. Of this application of stencilling to wall-papers many beautiful designs were shown us. We can see many advantages in this treatment of wall surfaces; the pattern can be designed with a particular regard to the shape and extent of surface. For instance, a very nice pilaster design is treated as an arabesque in grey tones; panels and filling and dadoes can have special stencil designs made, at a price which would little exceed the higher class of wall-papering. By this means cutting the pattern, which spoils so many wall-papers, is avoided. The ceiling of the showroom shows the extension of the process to ceiling decoration—in this case a refined Italian design on printed ground, with centre oval, garlands, and figure-subjects introduced as medallions, having all the appearance of hand-painted work, and washable. Stencilling is also applied to curtain materials, seat covers, &c., made of mohair and silk, worsted leno, and other soft woollen fabrics on plain cream or coloured grounds, or over a light under-pattern. We saw wall panels, curtains, portières, upholstery, and draperies treated in this manner with high artistic effect. These stencilled fabrics will stand washing, and the wall-papers can also be cleaned with sponge, soap, and water. The stencilled patterns on some of the specimens we examined impart a great richness to the material, the blending and shading of colour from light to dark, blues, reds and greys, being extremely decorative. We also notice a painted flock in dark warm bronze colour, some very handsome deep-red curtains with appliqué work, some embossed leather lacquered adapted for dadoes; also a twill-cloth material made of jute, having a bold stencilled pattern, admirable for exposed wall surfaces, and a Japanese canvas paper, lacquered over with bronze and stencilled, of very rich modelled effect. Architects will do wisely to adopt the wall and ceiling decorations in stencilled work, which are so effective. The stencils run from 1s. 6d. per yard and upwards, and for dadoes and friezes the effect cannot be surpassed. Hand-painted friezes on canvas, in oil colours, gilded or lacquered, or modelled in plaster, as in the "Mermaid" frieze, choice specimens of cabinets and marquetry may be seen at these showrooms, and show developments in decoration and furnishing which were unknown a few years ago. In the lower showroom, Messrs. Aldam Heaton and Co. have many very beautiful decorations and woodwork for the last new Atlantic liner.

At the London Consistory Court, last week, the Chancellor granted a faculty to erect a reredos in the church of St. Gabriel, Pimlico, and to transfer the present reredos to the apse of the south chapel, and to place in the south chapel a Holy Table. He also granted a faculty for adding a choir vestry to St. James's Church, Piccadilly.

In our description last week of the Hotel Métropole, Folkestone, we omitted to mention that Claridge's Patent Asphalte is laid upon all the flat roofs, balconies, and billiard-rooms, and is also used for lining the rainwater tanks, and in the broad gutters and areas, and wherever a smooth and water-tight surface was required. The architect has had great experience of the company's material, and has most judiciously used it in the present instance.

NEW HOUSES OF PARLIAMENT, SYDNEY, N.S.W.—THE "PUNCH" HOTEL, HULL.—DESIGN FOR DECORATION OF AN OVERMANTEL.—STAIRCASE IN VILLA DELIUS, AIX-LA-CHAPPELLE.—PASSMORE EDWARDS CONVALESCENT HOME, PEGWELL BAY.—ST. GEORGE'S FREE LIBRARY, BRISTOL.

Our Illustrations.

PROPOSED NEW HOUSES OF PARLIAMENT, SYDNEY.

An original design, with dome, estimated to cost £465,636, is the one of which the plan, but not the exterior, was approved by the Cabinet. The original alternative design with tower, estimated at £522,916, speaks for itself. The modified design, with dome, has been proposed so as to work it in with the plans of the first design, and at the same time to reduce the cost. This has been effected. A special and interesting feature has been introduced in the modification—viz., the substitution of a sloping garden to the basement on the front and lateral façades of the building instead of the open excavated area shown in the original design. Our illustrations are from photographs and sun-prints taken by the photographer to the Public Works Department for New South Wales, from the plans and water-colour perspectives prepared in the Government architect's office. The architect is Mr. W. L. Vernon, F.R.I.B.A.

THE "PUNCH" HOTEL, HULL.

This building, for the Hull Brewery Company, Limited, now completed, is built of thin red bricks with terracotta dressings and has a light red granite base, and Staffordshire tiles are used for the roof. The architects have endeavoured to make a bright and pleasing front, while departing from the usual stereotyped public-house style. The front of the site is a continual curve, as will be seen from the plans given with the geometrical elevation. The contractor for the building is Mr. Drury, of Hull. Messrs. Jones and Willis supplied the wrought-iron work. Messrs. Smith, Brodric, and Lowther, of Hull, are the architects.

NATIONAL SILVER MEDAL DESIGN FOR THE DECORATION OF AN OVERMANTEL.

Mr. JOSEPH OGDEN, the author of this prize design, has undoubtedly displayed considerable skill and refined taste in the enrichments of his scheme, employing very simple framing for the overmantel itself, and thereby insuring his effect almost entirely by the judicious use of well-balanced ornament, which was specially mentioned in the Science and Art Department official report of the examiners—Messrs. W. de Morgan, Maurice B. Adams, and Lewis F. Day, as "an extremely able design." The drawing, which we have to-day reproduced, was effectively rendered in black and white lines on brown paper so that our illustration herewith is a facsimile, only to a smaller scale than the original.

STAIRCASE: VILLA DELIUS, AIX-LA-CHAPPELLE.

This mansion, of which Mr. Georg Frenzen is the architect, is distinctly representative of modern Continental work of the more monumental kind, and this typical character is emphasised by the arrangement of its grand staircase, of which we give a photographic illustration. The archway at the foot of the first flight leads into the lower entrance hall, above which occurs the lantern-lighted gallery seen over the balustrade in our view. To the well-opening of this gallery a wrought-iron balcony front adds much richness, while marble columns and pilasters divide the walls of the hall into arched compartments. The execution of the masonry leaves nothing to be desired in finish and precision, for it has been thoroughly well built. Other views are given in Mr. Ernst Wasmuth's very comprehensive "Architektur der Gegenwart," the latest part of which, just issued, has now reached us. The plates, numbering over 100, are exquisitely produced by the Lichtdruck process to folio size from specially-taken photographs of every kind of building in Belgium and Germany, both old and new. There are several plans too, adding to the value of the publication, which is edited by Mr. Hugo Licht. We have made our choice to-day as an example of the remainder.

NEW WING AND TOWER BELVEDERE, PASSMORE EDWARDS CONVALESCENT HOME, PEGWELL BAY.

On Saturday last Mrs. J. Passmore Edwards laid the foundation-stone of the new wing of this building, which belongs to the Working Men's Club and Institute Union, Clerkenwell-road, E.C., and has been in use as a home for working men from three to four years. Having proved so useful and beneficial an institution, it is now being considerably enlarged, and a tower is erecting surmounted by a belvedere commanding a splendid view over the bay from Ramsgate to Deal. The premises, originally used as an hotel, were purchased by Mr. J. Passmore Edwards and given by him to the Club Union, who furnished the building after it had been renovated and adapted at the cost of Mr. Passmore Edwards, under the direction of Mr. Maurice B. Adams, F.R.I.B.A. This year the present enlargements have been put in hand by the Working Men's Club Union, at a cost of between £4,000 and £5,000, Mr. Passmore Edwards having supplemented his previous gift by handing over the adjacent freehold land to the institution, thus enabling a further public improvement also to be made by the Borough of Ramsgate by widening the public highway between Minster and Ramsgate just where the Pegwell Bay road was exceedingly dangerous and narrow. The recreation rooms, as well as the dining-hall, are located on the other side of the road with a subway approach, and here also, immediately on the shore, are the tennis-courts and summer-houses. The new buildings include accommodation for 32 additional beds, a laundry and series of lavatories and water-closets, bath-rooms, &c. The walls are lined with Messrs. Cliff and Sons' glazed bricks. Messrs. Mark Fawcett and Co.'s fireproof flooring is employed. The design has necessarily been made to assimilate with the original block; but an endeavour to give a more decided architectural character to the grouping has been made by the architect in designing the tower, which is capped by a lead-covered dome. The builders are Messrs. Jarman and Sons, of Ramsgate, and the architect is Mr. Maurice B. Adams, F.R.I.B.A.

ST. GEORGE'S FREE LIBRARY, BRISTOL.

On Saturday last the foundation-stone of this branch library was laid. It is a munificent gift to the town by Sir W. H. Wills, M.P. The architect is Mr. Frank Wills, and the builders are Messrs. William Cowlin and Son. Mr. E. Norris Mathews is the city librarian. The site is nearly opposite the parochial offices, on the edge of St. George's Public Park. The materials used are red Cattybrook bricks, with Ham Hill stone dressings. The library building will have a frontage of about 78ft., and a depth nearly as great. On each side of the central entrance will be large bays carried to the roof and terminating in an ornamented gable, while the entrance in the form of a smaller bay will be continued to a similar height and terminated by a turret. The roof will be tiled. Internally, nearly the whole of the building will be in one, and it will be open to the pitch of the roof, the supporting beams of which will be visible. The inside walls are to be

sand-stuccoed. To the right of the entrance the floor space is to be allocated to a reference department, the bay on that side forming part of this section, while the left bay and a considerable part of the hall on that side will be devoted to newspaper readers. Across the rear end of the hall will be an arcade (the columns and seven semi-circular arches being of Ham Hill stone) and behind it is to be the lending library, librarian's rooms, and boys' department. The counter separating the assistants in the lending department from the public extends under three arches, and behind it will be ample book-shelves for a large library. The building will be heated by hot-water apparatus, and is to be completed by Christmas. The cost is expected to be not far short of £6,000.

CHIPS.

In our notice of the alterations at Wolsingham Church, on page 10, we should have mentioned that the wood-block flooring was laid by Mr. Roger Lowe, of Farnworth.

At the Mersey Docks and Harbour Board Offices, Liverpool, on Monday, an album was presented to Mr. George F. Lyster by the staff of the engineering department of the Trust. In 1861, when he was 40 years of age, Mr. Lyster was appointed engineer-in-chief of the Liverpool and Birkenhead Dock Estate, and passed from active to consultative work in 1889. In thanking his former colleagues, Mr. Lyster referred to the great advances made in the dock system of Liverpool, and said that during the period he had been connected with the board a sum of 18 millions sterling had been expended.

Lady Stephenson laid the corner-stone on Friday of a church at Brocco Bank, Sheffield, which is to cost £7,700, apart from furnishing. It is Early English in style, and will accommodate 650 worshippers. Mr. J. D. Webster, of Sheffield, is the architect, and Mr. James Fidler, of Eckington, the contractor.

A select committee of the House of Lords on Monday gave their sanction to the Brompton and Piccadilly-circus Railway Bill, under which it is proposed to construct an underground electric railway, two miles in length, running from Piccadilly-circus to Brompton, and having communication at South Kensington with the District Railway Company. There will be seven stations on the line including the terminals, and it is intended to introduce a three-minutes' service. The Bill has already passed the House of Commons.

A new street at Edinburgh, half a mile in length, and 80ft. in width, which the Heriot Trust has made between Leith-walk and Broughton-road, was formally opened on Friday by Lord Provost McDonald.

The foundation-stone of the free library which Sir William Henry Wills, M.P., has undertaken to provide for the parish of St. George, Bristol, was laid on Saturday afternoon by Mr. Augustine Birrell, Q.C., M.P. The site is on the main road, near the District Council offices, and the building, which is to afford accommodation for 300 readers at a time, with shelving for about 11,000 volumes, will be in the style of Late Tudor Renaissance. It will be a single-storied building, with Cattybrook brick facings, and Ham Hill stone dressings. The contractors are Messrs. W. Cowlin and Sons, the architect being Mr. Frank Wills, also of Bristol. The cost will be £6,000.

A fire broke out at Roe's timber-yard, Derby, on Wednesday week, and, spreading to adjoining premises, assumed great dimensions. The damage is estimated at £70,000, and a considerable number of people have lost employment and furniture.

Before Mr. Justice Lawrence at the Bristol Assizes on Friday, Francis Ball, civil engineer, employed as assistant surveyor by the Bristol Corporation, pleaded guilty of stealing £2,494, the property of the corporation. Isaac Jenkins Pearce, a youth, pleaded guilty of conspiring with him, but not of stealing £157. Full restitution of the money had been made. The Judge said it was a very grave case, and as a warning to others he sentenced Ball to seven years' penal servitude. Pearce was sentenced to twelve months' hard labour.

In the course of excavations made by workmen employed in demolishing old buildings in Northgate-street, Chester, the base of a Roman column has been uncovered. The relic is the largest specimen of its kind yet found in Chester. It is composed of a square base of red sandstone, the sides being 4ft. 6in. in length, and the height 1ft. 4in. Surmounting this is a moulded circular column 2ft. 10in. in diameter, with a height of 1ft. 8in., this, of course, being the proper proportion. The spot where the discovery was made is just under the foundations of what was known as the Old Lightcake shop, a curious little establishment, which was some four or five feet below the level of the street.

New Parliamentary Buildings
Sydney

Fi

3, JULY 16, 1897.

Floor Plan

THE NATIONAL GALLERY OF BRITISH ART.

THIS building was commenced about September, 1893, and is to be opened by H.R.H. the Prince of Wales on the 21st inst. On Wednesday a private view of the buildings took place, when the donor, Mr. Henry Tate, J.P., and Sir Edward Poynter, P.R.A., met the visitors. We illustrated the Gallery and gave plans in our issue for March 17, 1893. The foundations are carried down about 30ft. below ground-level, and cost alone about £12,000. The style of the building is a Free Classic, handled with reserve and a richness of detail showing study and breadth of treatment. The elevations are symmetrical, and are faced with Portland stone. The chief features of the façade overlooking the Thames at Pimlico is the lofty central portion with a portico of six Corinthian columns with a pediment over. This portion projects some distance beyond the main face of the building, and has a flight of steps up to the entrances, and at the extreme ends of the block are two pavilions, having an order of Corinthian pilasters raised on pedestals and terminating in pediments—between the pilasters are deep niches with an Ionic order of columns and pilasters supporting entablatures with semicircular arches over. The intervening portion of the elevation is a plain ashlar wall, having in the centre of its length another niche flanked with Ionic pilasters with a semicircular arch over. A rusticated basement, 10ft. high, runs entirely round the elevations, supporting a pedestal treatment 6ft. high, from which the various orders of columns and pilasters spring. The length of the front elevation is about 290ft., that of the side, including the projecting central portion, is about 140ft. The projection of the flight of entrance steps is about 40ft. beyond, forming a handsome approach to the main entrance, though the general effect is for the present somewhat spoiled by the erection of a very ugly temporary wall put up by the London County Council, preceding the erection of the new bridge at Vauxhall. The total height of the entrance-portico from ground-level to apex of pediment is about 65ft. 6in. A figure of Britannia on a high Acroteria block surmounts the main pediment, with a lion and unicorn on either side. The entrance-doors lead into a rectangular vestibule 50ft. long and 26ft. wide, which has an Ionic Order 13ft. high running round the sides, with banded rustication between them for wall-surface, all in Portland stone. The ceiling is a plaster barrel vault with panelled stone ribs springing from the Ionic entablature over the coupled columns. The height from the pavement to the crown of the vault is about 25ft. 6in. The vestibule is lighted from the ends by semicircular headed windows with ornamental iron grilles, and with an order of Doric columns at the side, and the effect is exceedingly massive and monumental. From the vestibule is entered a corridor surrounding the central octagonal sculpture hall, which has four entrances and four semicircular niches or recesses for seats or sculpture. A pavement fountain imparts a cool and decorative effect. Above, the architecture is florid, and the whole is surmounted by a glazed dome 76ft. high from the floor. From the corridor or sculpture hall the various picture galleries are entered, and so arranged that there is no necessity to retrace one's steps. Drinking-fountains on each side, located in wall niches, are prettily managed. There are seven picture galleries, three of them being 59ft. long by 32ft. wide, the long gallery is 93ft. long and 32ft. wide, and the square gallery 32ft. by 32ft. The inside of the flanking pavilions are treated as octagons, used as picture galleries. They are roofed by a glass dome with panelled and ornamental plaster ribs and cornices. The galleries are all top-lighted, the ceiling being formed with elliptical panelled plaster ribs and ornamental spandrels, the height from floor to apex of ellipse being 26ft., W. E. Rendle and Co.'s patent glazing being used. The corridor on the ground floor is divided up by piers into squares and ellipses, and has small flat domes over each. At the ends of the corridors are circular staircases, which lead up to the first-floor sculpture gallery and to the picture gallery over the vestibule, which is about the same size. The stairs are white marble. The basement of the building is to be used for picture restoring and cleaning rooms, students' easels, store-rooms, offices, and boiler-house. The floors of central part are in Sicilian marble and marble mosaic, and the galleries have polished oak floors.

Dennett and Ingle's fire-proof construction is used for floors; the carving has been carried out under the direction of Mr. Christopher Smith, and Messrs. Drake and Gorham and Mr. Russell are responsible for the electric lighting, and, as before mentioned, Messrs. W. E. Rendle and Co. have done the roof glazing. The builders are Messrs. Higgs and Hill. Mr. Sidney R. J. Smith, F.R.I.B.A., is the architect. The cost has been about £80,000.

We have not left ourselves much space to notice the collection of modern English pictures with which the walls of the galleries are hung. They are derived from four sources: the splendid series of works, about a hundred in number, which Mr. Tate has been purchasing from time to time, and which hitherto have been hung in the owner's house at Streatham, and are now presented with the building to the nation: seventeen pictures by Mr. G. F. Watts, and given by the artist; the canvases purchased by the Chantrey trustees, and hitherto very imperfectly shown at South Kensington; and lastly, a liberal selection from the British works hitherto hung at the National Gallery.

In the Tate collection proper are included about a hundred pictures, among which we noted Leighton's well-known circular canvas, "The Sea giving up her Dead," Millais's "Vale of Rest," "Ophelia," "North-West Passage," "St. Bartholomew's Day," "St. Stephen's," and "Knight Delivering a Lady." There are also Landseer's "Uncle Tom and his Wife for Sale" (two black pug dogs), an early landscape by Old Crome, three works by Orchardson ("Her Mother's Voice," "The First Dance," and "The Quarrel"), Fildes' "Doctor," and examples of Muller, Albert Moore, J. W. Waterlow, A. Gow, Briton Riviere, G. H. Boughton, J. C. Hook, Henry Woods, and others.

Mr. Watts's gift includes "Love and Life," "Love and Death," "Death Crowning Innocence," "Sic Transit," "Hope," "The Man who had great Possessions," and "Jonah."

In the Chantrey Bequest are Watts's "Psyche," Millais' "Speak," Leighton's "Bath of Psyche," Poynter's "Visit to Esculapius," Dicksee's "Harmony," Orchardson's "Napoleon on the Bellerophon," Herkomer's "Charterhouse Chapel," Vicat Cole's "Pool of London," seascapes by Colin Hunter, Brett, and W. L. Wyllie; landscapes by Corbet and Adrian Stokes, Mrs. Merritt's "Love Locked Out," and works by Tuke, Sargent, Walter Hunt, and La Thangue.

The pictures transferred from the National Gallery include small works by Crome, Holland, Creswick, and Wilcock, two examples each of Landseer, Wilkie, Leslie, and E. M. Ward; Cecil Lawson's "August Moon," Frith's "Derby Day," and Rossetti's "Annunciation."

ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

THE annual meeting of the Association of Municipal and County Engineers was opened in the Westminster Town Hall on Thursday last week. Sir A. R. Binnie, C.E., chief engineer to the London County Council, presided, and there were present about one hundred Metropolitan and provincial engineers and surveyors. Sir A. R. Binnie, in his presidential address, having given an historical sketch of the growth, progress, and government of London, dealt with the institution and work of the London County Council. With reference to local government, he was of opinion that there was a great deal of energy wasted in the useless discussion of professional details. Local governing bodies must, of course, discuss the general principles of the work which they intrusted to their officials; but having done so, he thought it would conduce to the general welfare if there were less discussion of details and criticism of uncompleted work. He knew there were many points relating to the housing of the working classes, and the rates of pay and working hours of the labouring classes with which only a deliberate assembly representative of the ratepayers could properly deal; but on purely professional details, he thought there was too much criticism. Mr. W. J. Dibdin, chemist to the London County Council, afterwards read a paper on "The Biological Purification of Sewage," and Mr. Thomas, county surveyor of Buckinghamshire, read a paper on "The Buckinghamshire Road System of the Equalisation of County Roads." In the evening, Sir A. R. Binnie, occupied the chair at the annual

dinner held at the Trocadero Restaurant, Piccadilly-circus, W. The company included Mr. J. P. Skinner (Mayor of Eastbourne), Dr. Renault, M.P., Mr. Jesse Jacobs (Master of the Carpenters' Company), Dr. Shirley Murphy, Mr. W. A. Blaxland, Mr. F. J. C. May, Mr. C. H. Lowe, Mr. O. C. Robson, Mr. W. Weaver, and Mr. Thomas Cole (secretary). Mr. Bassett Hopkins proposed "The Association of Municipal and County Engineers." The career of the association had, he said, been one of uninterrupted progress. It now numbered something like 800 effective members, who were to be found in every quarter of the globe. It encouraged young men by holding examinations in those departments of study which were most essential to municipal engineers, and its members held periodical meetings for mutual instruction and information. By its operations it had distinctly raised the status of the profession. The president, in response, said that at present municipal and Parliamentary institutions were somewhat overburdened by the duties thrown upon them, and he looked in the future to a larger development of municipal life to relieve Parliament of many of those matters with which at the present time it had to deal. Other toasts followed.

The conference was resumed at the Town Hall, Westminster, on Friday, Sir A. R. Binnie presiding. Mr. J. T. Eays, C.E., of Birmingham, read a paper on "Brick-paving for Carriage-ways." He said the question of paving roads with bricks had received very little attention in England, and although this country was justly celebrated for the quality of its bricks, and notwithstanding the fact that such large quantities were used for footpaths, strangely enough it had been left for their American cousins to show what could be done in the way of providing brick pavement for carriage-way traffic. One American State alone produced 500 million paving bricks per annum; another produced 300 million. He had obtained particulars from 52 towns and cities, where no fewer than 410 miles of brick-paved roads had been laid. Having dealt with the composition, size, quality, testing, and laying of brick pavements, Mr. Eays said it was claimed that neither granite, asphalt, nor wood could offer so many advantages as vitrified brick as a paving material, and that if properly laid it was as noiseless as any other kind of pavement. The surface was smooth without being slippery. It offered a minimum amount of resistance to the passage of traffic, and inflicted a minimum amount of wear and tear on horses and vehicles. It was practically impervious, and therefore perfectly sanitary; was easily cleansed, and required far less scavenging than any other paving. It could be washed without injury or becoming slippery when wet, was readily taken up and relaid, reasonable in first cost and maintenance, and had a life which compared favourably with other materials, such as wood, asphalt, &c. Mr. L. H. Isaacs, F.R.I.B.A., surveyor to the Board of Works for the Holborn district, read a paper on tramways laid in asphalt carriage-way pavements in the city of Berlin, and Mr. W. Weaver, C.E., Kensington, read a paper on street scavenging. The afternoon was devoted to a visit to the works of Messrs. Doulton and Co., at Lambeth.

On Saturday a visit was made to the works of Messrs. Aveling and Porter, of Rochester, leaving Victoria station by special train to Rochester Bridge. On arrival at Rochester an inspection of the works was made. Afterwards visits were made to the Cathedral and the Castle. The members were then entertained to luncheon, after which a trip on the river was made, returning from Chatham station in the evening.

Lady Brooks laid the foundation-stone of a nurses' home at Ashton-on-Mersey on Saturday, as a permanent memorial of the Queen's Jubilee. A site has been given by Sir William Cunliffe Brooks, and the cost of building and furnishing will be over £2,000.

Colonel A. J. Hepper, an inspector appointed by the Local Government Board, held an inquiry at the town-hall, Dudley, last week, as to the application of the town council to borrow £3,123 for various public improvements, including £1,431 for the provision of night-soil depots, £1,000 for the purchase of land in Stone-street for mortuary, weights and measures offices, &c.; £320 for the improvement of Vicar-street, £182 for works of sewerage and drainage, £120 for additions to the public baths, and £70 for a women's lavatory in Stone-street.

THOUGHTS AND FANCIES.*

MR. COTTON, whose pleasant little volume entitled "Song and Sentiment" we noticed nearly six years since, and whose "Suggestions in Architectural Design" we reviewed just about this time last year, has published another collection of healthy virile verse, embellished by etchings and sketches of his own of considerable excellence.

Mr. Cotton is catholic in the selection of his themes, and seldom falls back on professional images or associations. He has a decided gift in the condensation into pithy couplets of sentiments well worth remembrance—such, for instance, as the following:—

CLEVERNESS AND STUPIDITY.

The brilliant man is no more worthy praise
Than is the dullard fool deserving blame;
There is no merit and there is no shame
In what depends on birthright, or the ways
Of freakish fortune, which no skill can tame.

Credit is due, alone, to him who strives—
As his best lights direct him—to improve
His natural endowments, and remove
All baser taints; that his successors' lives
May be upraised into a higher groove.

The volume is nicely printed and produced, and deserves friendly professional recognition.

OBITUARY.

MR. SAMUEL A. WARNER, a well-known architect of New York, died a fortnight ago, in his 75th year. Mr. Warner was born in Genesee, in the interior of New York State. He received his professional training in New York, in the office of his father, Cyrus L. Warner, and succeeded to his business. For many years he carried on an extensive practice. In the busy time succeeding the War he designed a large number of mercantile buildings, but he had also commissions of other sorts, and several important public buildings in the South, as well as the Reformed Church on Fifth-avenue and Twenty-ninth-street, are from his plans. Although he had acquired a large fortune, it was his pleasure to continue his active practice, which he only resigned last year, on the appearance of serious malady, to his brother and nephew.

THERE died at Dogsthorpe Grange, Peterborough, on Friday morning, Mr. JAMES McCULLUM CRAIG, who was practically the founder of the great brick industry at Fletton. As a young man, in 1854, deceased went to Peterborough to assist his uncle, Mr. J. B. Craig, in the Scotch trade. He subsequently bought Mr. Foote's business in the Market-place, was very successful, and afterwards opened a brickyard at Fletton. The dry process of brickmaking came in vogue soon after, and knowing the Fletton brick-earth to be invaluable for this method, he bought up land freely, opened other yards, and sold out at prodigiously remunerative figures. He had lately erected much house property in the city, having bought the old Pond estate in Lincoln-road, through which Craig-street perpetuates his name. Mr. Craig died at the comparatively early age of 59.

Mr. George Law, contractor, of Kidderminster, has secured the contract for the construction of the electric tramway from Kidderminster to Stourport, and for the necessary building connected with the undertaking. The amount is about £24,000, and the work is to be completed in a period of seven months, and will, therefore, be vigorously pushed forward.

The opening of a new Primitive Methodist church and schools at Nuneaton, the architect of which was Mr. F. J. Yates, of Birmingham, took place on Friday. The new building is in style Modern Gothic. It will hold 500 worshippers, and the schools will contain 350 to 400 children. The site cost £230, and the contract was for £2,250. Mr. C. Williams, of Tamworth, was the builder.

The plans of Mr. John R. Thomas for the new Hall of Records for New York have been formally adopted, as a result of a favourable report by a board of experts, consisting of Professor W. R. Ware and Messrs. Henry G. Marquand and Montgomery Schuyler, and will be carried out at once. The design of Mr. Thomas was selected a few years since in the abortive competition for the rebuilding of the City Hall of New York, and the present commission for the Hall of Records is awarded him as a kind of consolation prize.

* Thoughts and Fancies. By JOHN COTTON, F.R.I.B.A., author of "Song and Sentiment." London: Simpkin, Marshall, and Co.

COMPETITIONS.

PATRICROFT.—Acting on the recommendation of the building committee, the Barton Board of Guardians decided on Friday on six designs submitted to them for a new workhouse hospital, to be erected at Patricroft. They awarded the first premium, £50, to "Sanitas," Messrs. T. Worthington and Sons, architects, Manchester; the second, £30, to "Red Cross," Messrs. Booth and Chadwick, Manchester; and the third, £20, to Messrs. Maxwell and Tuke, Manchester. The estimated cost of the hospital of the selected design was £22,000, and the others varied from £16,000 to £17,000.

TONBRIDGE.—At the last meeting of the urban district council it was reported that the committee, with Mr. F. W. Hunt, F.R.I.B.A., of London, had gone through the twenty-seven plans sent in for the new Technical Institute and Free Library, and had awarded the first premium to "Art," by Mr. J. H. Phillips, of St. John's Chambers, Cardiff, whose estimate was for £4,074; the second to "Light," by Mr. John Johnson, A.R.I.B.A., of 9, Queen Victoria-street, Mansion House; and the third to "Expert," by Mr. H. A. Cheers, of Twickenham.

WORCESTER.—The city council recently received 22 competitive schemes for the disposal of the sewage of the city, the estimates ranging from £5,000 to £62,000. These schemes were referred to Mr. George Chatterton, M.I.C.E., and pursuant to his advice the premiums referred to in the advertisement have been awarded as follows:—First premium of £125 to the authors of the scheme marked "P," Messrs. Fredk. Beesley and Son, 11, Victoria-street, Westminster; second premium of £75 to the author of scheme marked "X," Mr. R. E. W. Berrington, Lichfield-street, Wolverhampton; and the third premium of £50 to the authors of scheme marked "Y," Messrs. Hinnell and Murphy, Corporation-street, Manchester. Messrs. F. Beesley and Son's scheme provides for conveying the sewage from the Diglis outfall by a siphon under the river to the west side, connecting the St. John's outfall with the same sewer, and thence to a pump-well on the site purchased by the Council at Bromwich, the sewage being pumped by steam-engines, and dealt with chemically by precipitation in tanks, the effluent being filtered through coke-breeze filters, then run over 17 acres of the irrigation ground before its discharge into the river, the sludge being dealt with by sludge presses. The dry-weather flow is taken at 2,000,000 gallons per day, and in wet weather 10,000,000 gallons. The estimated cost of the works is £48,165, and the working expenses £2,210 per annum.

CHIPS.

The Society of Architects will pay a visit to Canterbury on Saturday in next week, the 24th inst., starting from Victoria Station about 11 a.m., when the Dean, Dr. Farrar, an hon. member of the society, has kindly promised to receive the party, and give every facility for a thorough inspection of the cathedral. It is just seven years since the Society last visited this city.

An organ in pitch-pine case was dedicated on Friday at the Baptist chapel, Bampton, Devon. The instrument was built by Messrs. Hardy and Son, of Stockport.

The Sparrow's Nest estate at Lowestoft, consisting of nearly six acres of well-laid-out grounds, adjoining Belle Vue Park, was sold by auction on Wednesday, and bought by the corporation, as an addition to the park, for £7,200.

At St. Andrew's Church, Derby, on Saturday afternoon, a stained-glass window, costing £800, and erected to the memory of the late Rev. Robert Hey, for 16 years vicar of the parish, was unveiled and dedicated. The general design of the window illustrates "The Benedicite."

A two days' bazaar was held in the picturesque grounds of Wotton Hall, Wotton-le-Wear, last week, in aid of the restoration fund for the parish church. Plans for the work of restoration and enlargement, at a total cost of about £1,800, have been prepared by Mr. C. Hodgson Fowler, of Durham.

A Local Government Board inquiry was held by Mr. Ducat at Radcliffe on Tuesday and Wednesday respecting an application of the Radcliffe District Council to borrow £13,000 for sewage works. The amount would have been much larger but for a concession granted by the Local Government Board after Colonel Mellor had raised the question in the House of Commons.

Building Intelligence.

KENNINGTON-ROAD, S.E.—The new public baths built at the corner of Kennington and Lambeth roads for the Lambeth vestry were opened on Saturday by the Prince of Wales. The building covers an area of 33,000 square yards, and it has been erected from designs by Mr. A. Hessel Tiltman, and was illustrated in our pages on December 20, 1895. The frontages are of red brick, with a sparing use of Portland stone. The accommodation provided is three swimming baths (with provision for a fourth at an early date), 96 slipper baths, and a public washhouse containing 64 washing compartments. The sizes and areas of the swimming baths are as follows:—First-class men's, 142ft. 6in. by 56ft. 8in.; pond, 132ft. by 40ft.; second-class men's, 98ft. by 42ft.; pond, 90ft. by 30ft.; women's swimming, 60ft. by 40ft.; pond, 56ft. by 25ft. The hall, when arranged for entertainments of any kind, will be entirely shut off from any other portion of the establishment, and will afford seating accommodation on the ground floor for 1,222 persons, and on the gallery floor for another 300. The general contractor was Mr. Walter Wallis, of Balham, with Mr. E. Smith as clerk of works. Messrs. William Edgecumbe Rendle and Co., of 5, Victoria-street, Westminster, makers of the well-known Invincible glazing, supplied all the glazing to the baths. The baths are lighted throughout by electricity.

WANTAGE.—Lily Wantage laid, last week, the foundation-stones of two new buildings which are to be erected at Wantage in connection with St. Mary's Home, raising the number of schools from three to five. One new group of buildings will be erected, under the care of the Sisters, between Ormond-road and Wallingford-street, and will stand in five acres of ground. It will have a frontage of 310ft. and a height of 56ft., and will be a plain substantial brick building relieved with some stonework, and a red-tiled roof. In addition to a chapel at the east end, there will be in the rear a large swimming-bath 70ft. by 30ft., covered in and heated with steam pipes, with dressing-boxes, and a gymnasium close by. The building will also contain a school hall, classrooms, Kindergarten school with offices, students' room, dining-room, guests' room, waiting-rooms, recreation-rooms, drawing-rooms, studios, mistresses' sitting-room, library, chaplain's room, music-practising rooms, dormitories, chapel, and infirmary. There will be room for 112 boarders and 100 day scholars. At St. Michael's, in Tanner-street, the Sisters have decided to add a new wing, which will afford accommodation for 40 more pupil teachers. This new wing will be connected with the present building by a long corridor. Mr. Mowbray is the architect for both works.

Engineering Notes.

DOVER GOVERNMENT HARBOUR.—An official memorandum issued by the Admiralty on Thursday gives some facts with respect to the progress of the naval works now in course of construction. The document is attached to the Naval Works Bill, which asks for £654,000, the excess of the total estimated expenditure up to the end of next March over the balances of £2,088,900 available from previous Acts. As regards Dover Harbour, a complete survey and plans, prepared by Messrs. Coode, Son, and Matthews, and concurred in by the Civil Engineer-in-Chief of the Admiralty, have been officially considered and approved by a joint committee representing the Admiralty, War Office, and Board of Trade. They provide for an inclosed harbour of 610 acres at low water, and follow in the main the plan of the harbour recommended by the Royal Commission of 1844. The estimate given for this undertaking a year ago was two millions; but it was explained at the time that this reckoning was subject to revision, and it is now estimated that its cost will amount to £3,500,000. The new works at Dover Harbour are being entered upon during the current year, and £200,000 will be spent on them in the course of the year, and the whole undertaking will be finished by 1908.

THE LIGHT RAILWAY COMMISSION.—The following is a full list of applications for Orders

authorising light railways:—England: Bridlington, Beaford, and North Frodingham, East Riding, Yorkshire, 9½ miles, steam; Corporation of London Foreign Cattle Market, Deptford, ¾ mile, animal, steam, or electric; Dartford District, Kent, 24 miles, Derby and Ashbourne, Derby, 12 miles, Dudley and District, Worcester, 8½ miles, and Goole and Marshland, West Riding, Yorkshire, 14 miles, electric; Kelvedon, Tiptree, and Tollesbury, Essex, 10 miles, Lastingham and Sinnington, North Riding, Yorkshire, 3½ miles, Leek, Caldon, Low, and Hartington, Staffordshire, 17½ miles, Lincolnshire and Northamptonshire (Lincolnshire and Northants), 9 miles, Lizard, Cornwall, 11½ miles, and North Holderness, East Riding, Yorkshire, 12½ miles, steam; Norwich and District (No. 2), Norfolk, 6 miles, electric; Pewsey and Salisbury, Wiltshire, 20½, and Rea Valley, Salop, 8½ miles, steam; St. George and Hanham, Gloucestershire, 1½ mile, Taunton, Somerset, 2 miles, and Torquay and Paignton, Devon, 4 miles, electric; West Manchester, Lancashire, 5½ miles, steam or electric. Wales: Llandudno and Colwyn Bay, 8½ miles, electric; Llanfyllin and Llangynog, 10½ miles, Tanat Valley, Montgomery, Denbigh, and Salop, 15 miles, and Welshpool and Llanfair, 9½ miles, steam. Scotland: Dunfermline and Kincardine, Fife, 10½ miles, Echt (extension), Aberdeen, 3½ miles, Fraserburgh and St. Comb's, Aberdeen, 4½ miles, Gifford and Garvald, Haddington, 13 miles, and Loch Fyne, Argyll, and Dumbarton, 18½ miles, steam. Of these 28 projected lines, Dartford District, Norwich and District, Llandudno and Colwyn Bay, and Gifford and Garvald are applying again, and the Echt proposal is an extension of a light railway already granted.

THE PANAMA CANAL.—The British Consular officers at Panama and Santa Martha describe in their last reports the present condition of the work on the canal across the isthmus. The New Canal Company, formed in Paris in 1894 to continue and complete a ten-lock canal rising to a maximum altitude of 133ft. 8in. in place of the original sea-level scheme of M. de Lesseps, has made good progress with the small capital at its disposal, and the reduced canal trough, or cut, in the Emperor and Culebra sections is now assuming definite proportions. Although the end in view was the final completion of the canal, it could hardly have been supposed that this great undertaking could have terminated and the canal opened for maritime traffic with only 2½ million sterling, of which only about half was to be spent on the canal proper. The work is of a purely experimental character in order to demonstrate that a lock canal is feasible. It consists of a watercourse 98½ft. wide at the surface, with 49ft. depth of bed. About 60 millions sterling have been raised since the inception of the scheme 16 years ago for the purpose of the canal, and have been spent in one way or another.

CHIPS.

At the Provincial Grand Lodge of Mark Master Masons, held at Norwich on Tuesday last, Bro. J. W. Start, of St. Nicholas Lodge, Harwich, was unanimously elected provincial grand treasurer for East Anglia.

The report for June of the Labour Department states that on the whole there has been some falling-off in the state of employment during the past month, almost all the principal branches of industry being more or less affected by the decline. Employment, however, remains better than a year ago. Employment in the building trades, though still good, was scarcely so brisk at the end of the month, when the percentage of unemployed in unions making returns was 1.5, compared with 0.8 in May. The percentage for June, 1896, was also 1.5.

The memorial of the late Archbishop Benson in Canterbury Cathedral is to take the form of a canopied tomb beneath the north-west tower, close to the site of the place of burial.

The Prince of Wales has presented the drawing entitled "Summer Slumbers," by the late Lord Leighton, exhibited last winter among his works at Burlington House, to the collection of sketches which has been secured for the nation and is now being hung on the walls of the late President's house.

The West Mersea School Board have instructed Mr. J. W. Start, F.S.I., architect, of Colchester and Harwich, to prepare plans for a mixed school for 300 children, with central hall, and to utilise the present buildings as far as possible for cloak-rooms, heating-chamber, &c.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXI. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLV., XLVI., XLIX., LI., LIII., LIV., LVII., LIX., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

* In response to complaints from readers that they are unable to get the BUILDING NEWS at Messrs. W. H. Smith and Son's bookstalls, we can only suggest that they should order the paper of some other newsagent. Messrs. W. H. Smith and Son recently requested us to allow them an extra discount beyond that allowed to the general trade, and because we declined they have ceased to send the paper out to their bookstalls. We have, of course, no remedy; but we do not think the demand was a fair one.

Correspondence.

PROCEDURE AT THE R.I.B.A.

To the Editor of the BUILDING NEWS.

SIR,—The meeting at 9, Conduit-street yesterday evening was pre-eminently a characteristic one—redolent of the early days of the present Council (some time ago now)—and worthy of its traditional treatment of Associates. The Council and its followers came with the fixed determination, evident in every feature, to preserve to the bitter end an unruined front. The third chairman of this one-subject discussion certainly gave little opportunity for a fair and square fight, and two or three of the old and well-tried sticklers for soft phrases and buttered adjectives turned up, after a somewhat prolonged and regrettable absence from the meeting-room, to give him the benefit of their ancient experience in quelling turbulent spirits.

The case which I wish now to place before the profession is this: The Council brought forward certain resolutions with reference to the election of Fellows. A question arose as to whether Associates could vote on those resolutions, having regard to clause 28 of the Charter. The chairman, at the meeting of June 14 (p. 393 *Journal* R.I.B.A.), after reminding Associates of clause 28, ruled as follows, that "if, however, when the report was put as a whole, they (the Associates) objected to any part of it, Associates could then

exercise their right of voting against its adoption." The *Journal*, p. 394, states as follows:—"The motion for the adoption of the report, as modified, was then put, and carried by a majority of nineteen, forty-four voting in favour and twenty-five against." By-law 62 states, *inter alia*, as follows with reference to a resolution affecting a by-law:—"If the same be supported by a majority of at least two-thirds of those present having a right to vote and voting thereon."

Now, Sir, I contend that the ruling of the chairman gave Associates the right to vote on the report, and they voted, the result being that the two-thirds majority required by by-law 62 was not obtained—forty-six votes were required, and only forty-four secured. It can surely never be contended that when the chairman gave his ruling he was trifling with the Associates, and proclaiming peace when there was no peace! Then the alternative is that the whole proceeding is null and void, and must be, to become operative, gone through entirely again. It is this, of course, which the dear old Council cannot contemplate with equanimity; it is this which threatened to moisten the starch of the unruffled front; and it is this which we Associates should do our best to put right. Personally, I have no objection to placing in the hands of the council the election of Fellows as they desire. I have, as I stated in the room, confidence in their integrity in that respect; but I protest strongly against this transparent desire to shuffle through a mistaken procedure.

Clause 33 of the Charter terminates as follows:—"Provided always that no such by-laws (this includes alteration of by-laws) shall be of any force or validity whatever unless and until they have been approved by the Lords of the Most Honourable Privy Council."

What we have to do, therefore, is to bring formally before the Privy Council the facts of the case, and to ask that the request of the Council to add to the by-laws as they desire be not complied with.—I am, &c. W. WOODWARD.

13, Southampton-street, Strand, July 13.

RHOS-ON-SEA BUILDING ESTATE COMPETITION.

SIR,—Plans for the above competition were sent in on the 10th of January last, over six months ago. I have heard nothing as to the result. Can any reader give any information?—I am, &c.,

July 12.

J. L. S.

THE LATE MR. J. J. COLE.

SIR,—My attention has been called to your notice of my father in your issue of May 14. May I ask you to state that he did not design the Equitable Society's Offices in the Poultry, but those of the Gresham Life Assurance Society, which adjoin the former building?

His chief work, which is little seen by the public, was the large hall forming the New Stock Exchange, erected in 1885, which is worthy of note for its massive piers of polished granite, stone arches, and iron dome, the lantern of which is 100ft. from the floor.

My father was much interested in antiquities; but was not a member of the Society of Antiquaries.—I am, &c.,

R. LANGTON COLE.

23, Throgmorton-street, E.C., July 9.

At Tuesday's meeting of the London County Council a recommendation by the Highways Committee for the substitution of the electric light for gas on the Victoria Embankment and Westminster and Waterloo Bridges, at an estimated capital outlay of £22,000, was agreed to after a long discussion.

A tall decorative electric lamp which Mr. M'Ewan has erected in the open space outside the M'Ewan Hall, Edinburgh, and presented to the city, has just been completed. It has been designed by Dr. Rowand Anderson, and rises to a height of 45ft. from the ground. The base, which is triangular in form, consists of three grey granite steps, and the column tapers upwards by graduated stages, all richly decorated, to the lantern, which is of metal work, 12ft. high, and contains six Jandus lamps of 800c.p. each. The central stage of the structure, which, with the exception of the steps, is of Portland stone, contains three pieces of sculpture representing respectively the city arms, Mr. M'Ewan's coat of arms, and Jove holding aloft the lightning, with figures on either side of Darkness flying away and Light breaking. On the stage immediately below the lantern there is a frieze of dancing cherubs.

Intercommunication.

QUESTIONS.

[11702.]—**Drainage.**—A pair of semi-detached villas are being erected where there are two systems of drainage, the rain-water pipes being kept separate and distinct from the soil drains, and not connected in any way. Should the down-pipes discharge over gullies, or should they be connected to drain with an easy obtuse bend, and have one disconnecting trap before entering into rain-water sewer in road?—**PROUD SALOPIAN.**

[11703.]—**Eaves of Adjoining Building.**—It is proposed to raise building B to dotted lines. In order to do this, eaves of A would have to be cut away and a gutter formed. Would owners of B have a legal right to do this, and, if so, must a proper notice be served on owners of A? The wall is not a party one. Would not the projecting eaves of A, as shown, be an encroachment

on B. A was built after B, and the rain-water pipes from the eaves gutter is let into a chase in the wall (see C), thus indicating that the owners of A anticipate that B might at some time be remodelled and raised, consequently pipe is chased, so that it should not project into any room which might take the place of the present passage.—**EAVES.**

[11704.]—**Cement for Rottenstone.**—Could any reader give a recipe for cementing rottenstone or Fuller's earth into a concrete form?—**P. WILLIAMS.**

[11705.]—**Moulding Sawdust.**—Is there any stuff which, added to sawdust, makes the latter plastic, so as to run into a mould, and yet of such a nature that it gives off no disagreeable smell, or gives a disagreeable taste, or has any ill-effects on liquids?—**A. BOSWORTH.**

[11706.]—**Levelling Instruments.**—What is the best way to affix new papers on levelling staff to avoid any marked error in the shrinking or expansion of papers when mounting? Also, what is the proper method to test and adjust a surveyor's level?—**B. E. J.**

[11707.]—**Everest Theodolite.**—What is the general method of taking altitudes with this instrument? After setting-up and levelling the horizontal limb, should the telescope then be raised to make the horizontal wire cut the required point of which the altitude is to be taken, and now bringing the index-level bubble to the centre of its run, or should the index level be manipulated before making the observation? I have tried the latter method, and find that after raising the telescope the bubble has always moved a little with the telescope, and requires readjustment. Should this be so?—**D. M. Y. R.**

REPLIES.

[11706.]—**Architect's Responsibility.**—The contractors can claim their contract money if the property is sold, if there is a properly drawn-up contract, when a clause is generally inserted providing against such a contingency. In case of the bankruptcy of employer, his obligations under the contract will fall on his assignees or trustee, and the contractor can claim for any balance against the estate. I should advise "Pro et Con." to consult a solicitor, as the contract will determine the question of liability.—**G.**

[11701.]—**Floor Construction.**—The most substantial and economical construction for floors of the kind described by "Devonian" would be rolled steel girders every 3ft. or so apart, and joists supporting concrete arches or slabs of the Granolithic Company's material, or the Dennett system. The Expanded Metal Co.'s system has many good features, as the arches of concrete are strengthened by expanded-metal meshes, which are inserted in the concrete. The Roebbling floor system is also a good one. Small concrete arches turned between I rolled iron or steel joists are used; the arches are turned on bands of wire netting stiffened by $\frac{1}{2}$ in. iron rods every 2ft. apart. A wire netting is fixed below flanges for the plaster ceiling. (See articles appearing in this journal on "Arches in Concrete.") The concrete used had better be left to the manufacturers of the floor system, who have by experience found out the proper aggregate and matrix to be used to give the best result.—**C. C. C.**

[11693.]—**Elliptical Arches.**—I send the following in answer to "J. W. S.'s" further inquiry for a geometrical construction of an ellipse, having given both height and width. It was given me a few years ago at a brickwork and masonry class, but I have never had occasion to use it:— $AB = \text{span of arch}$, $AC = CB$; $CD = \text{rise}$, $DE = \frac{1}{2} \text{ of } DC$; and $AF = DE$. Join FE and bisect it at right angles by GH , which cuts DC produced in H . Join HF and produce to K . Then H is the centre for arc DK with radius HD , and F is centre for arc AK with radius FA . The other half is similar.—**W. F.**

The remarkable and unique collection of flint implements brought from Egypt by Mr. Seton-Karr has been purchased by the Liverpool Museum. Dr. Forbes has undertaken to describe the collection, and figure many of the specimens.

LEGAL INTELLIGENCE.

CARDIFF BUILDERS AT VARIANCE.—**UPHAM v. BURGESS AND SAUNDERS.**—In this case, tried at the Cardiff County-court last week, £20 was claimed by plaintiff, a Cardiff builder, against defendant, Burgess, another Cardiff builder, as damages for the construction by defendant of the water pipes of an adjoining house to plaintiff's in Pentreban-street, so that it discharged water into plaintiff's down pipe and on to plaintiff's land, and an injunction was claimed against Saunders, the present owner and occupier of the house. Plaintiff's counsel, in opening, admitted that since the action had been taken, the chief nuisance alleged—a pipe which discharged water on plaintiff's front garden—had been removed. The plaintiff gave evidence, but it appeared, in cross-examination, that no water was now discharged on the garden, but defendant still had his pipe connected with his (plaintiff's) down pipe. He had had an action against defendant already for the value of the pipe-end, and had been awarded £33. His Honour, after viewing plans and photographs, gave judgment for plaintiff for one farthing damages, without costs, and refused to grant an injunction.

MAKING-UP PRIVATE ROADS—ARBITRATION APPEAL.—In the Chancery Division on Friday, Mr. Justice Kekewich had before him the case of the "Urban District Council of Handsworth v. Derrington," which was an action to recover from the defendant, as owner of certain houses in Putney-road, his proportion of the cost of making, paving, and sewerage of the road. Defendant declining to comply with the usual notice to do the work, it was tendered for, and, upon its completion, the apportionment was referred to arbitration, with the result that in October, 1896, the arbitrator's award apportioned to Mr. Derrington £153 11s. 8d. as the sum for which he was liable. This was £2 less than the sum allotted by the surveyor. The points raised were three in number. The first and most important, counsel stated, was whether Putney-road was sewerage already. It was perfectly true that the road contained one or more sewers in one sense, a drain made by the owners of certain houses serving more than one house, and being connected with sewers running down other roads in Handsworth. As a whole, the street was unquestionably not sewerage; and it was submitted on plaintiffs' behalf that the mere existence of drains in the street did not bring them within the definition of a sewerage street within the meaning of the Act. This was obviously so, because these sewers were made by the owners of particular houses. They were not available for other houses in the street, and still less were they available for houses to be built on parts of the street not built upon. Plaintiffs' second point was that even if the existence of these sewers did constitute the sewerage of the street as a whole, it must be shown by the defendant that the street was sewerage to the satisfaction of the local authority, in order to prevent the Act from coming into operation. The third point was a technical objection raised by the defence to the effect that at the point where Stamford-road crossed Putney-road there was no adjoining owner, and therefore the local board had included too much in that which they had charged the frontagers. Plaintiffs' answer to this was that it was too late to take such an objection now. Any objection which went to show that the local board were trying to throw too much on the frontagers could only be dealt with by appeal to the Local Government Board. At the conclusion of the arguments, his lordship gave judgment for the plaintiffs for the amount claimed, with 4 per cent. interest, holding that they had acted entirely within their rights.

ARCHITECT'S CLAIM FOR DILAPIDATIONS AT BIRKDALE.—At Southport County Court on Tuesday, before Judge Collier and a jury, Stewart Speddy, architect and property owner, Southport, sued John Davie, sack merchant, Oxton and Liverpool, for £50, reduced from £80, for dilapidations at Temple House, No. 18, Trafalgar-road, Birkdale, let by plaintiff's agent to defendant for three years from July, 1893, at £90 per annum. Plaintiff said "a pig would leave its sty in a cleaner condition than this house was left." For the defence, counsel commented on the facts that the case took nine months for its incubation, and that originally £45 rent in lieu of notice was alone claimed; but this was afterwards abandoned when it was found that due notice had been given. He tendered expert and other evidence to show that the house was left in a proper state of repair, but it had since remained open to the public. Two items of damage only had been admitted, and 20s. paid into court. Defendant swore that he spent over £60 in repairs during his tenancy. In his reply, plaintiff's counsel said there had been no real delay in bringing the action. His Honour, in summing up, quoted this sentence from plaintiff's evidence: "When I found I could not get another six months' rent I thought I would go in for the dilapidations," and said the solicitor's letter demanding £80 was very peremptory. As to the suggestion by the defence that tramps had damaged the house, one witness

for the defence went so far as to say the house was in the same condition when defendant left it as it was now.—After twenty minutes' deliberation the jury found for the plaintiff for £25, including the £1 paid into court. Judgment was given accordingly, with costs.

STAINED GLASS.

MOSELEY.—A large stained-glass window, commemorative of her Majesty's sixty years' reign, is about to be placed in St. Agnes's Church, Moseley; and from the various competitive designs submitted, the award has been gained by Messrs. A. Ballantine and Gardener, of Edinburgh. The proposed window is ranged in five lofty Gothic lights with tracery. The central figure is that of our Lord, seated in majesty. The archangels St. Michael and St. Gabriel are on either side. Angels hover in concentrating groups. Biblical figures in attitudes of adoration occupy the three central lights, while the lights adjoining these, right and left, contain figures of the Blessed Virgin Mary and St. Agnes; also Abbess Hilda, King Alfred, and Queen Margaret, saints in the Royal line, and other saints as typifying the progress of religion, literature, arts, and science. In a rich mosaic band, dividing the figures from a Royal heraldic base, will be inscribed, "There are differences of administration, but the same Lord."

CHIPS.

The sanction of the Local Government Board was obtained on Saturday by the Northwich Rural District Council to borrowing £1,659, which, with nearly £2,400 raised by the Runcorn Urban District Council, will be expended upon the road between Runcorn and Barnton. The highway is now in a deplorable state, and is regarded by cyclists as the worst in Cheshire.

Mr. G. B. Benmore died on Saturday at Budleigh Lodge, Exmouth, at the age of 73. An Exmouthian by birth, he spent a number of years in Wales as architect, and later returned to pursue his profession at Exmouth. He was an active member of the old local board, and also represented the district on the Devonshire County Council. He had been in failing health for some months.

Additions are being made to the infirmary at Peterborough, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

Mr. James Neish, Stud. Inst. C.E., of Dundee, who was a pupil and latterly an assistant with Mr. D. Balfour, M. Inst. C.E., of Newcastle, has been appointed surveyor to the Pocklington Rural District Council, East Riding.

The annual exhibition of drawings, needlework, designing in paper and colour, modelling in clay and cardboard, woodwork, cookery, laundrywork, and kindergarten, executed in the various schools of the School Board for London, will be held at the Hugh Myddelton School, St. James's-walk, Clerkenwell Green, from (to-day) Friday to Wednesday next (Sunday excluded), from 12 noon to 8.30 p.m. The exhibition will be opened to-day by the Marquis of Londonderry (chairman of the board).

A Local Government Board inquiry was held in the Mayoress's Parlour, Coventry, on Thursday in last week, by Colonel Albert J. Hepper, D.S.O., R.E., into the application of the city council to borrow £5,416 for the purpose of the construction of a new street from Coventry to Earlsdon. The city surveyor (Mr. J. E. Swindlehurst) and the town clerk (Mr. L. Beard) explained the proposals.

At a meeting of the Hartley Council, held at Southampton last week, it was unanimously decided to provide additional classroom and sanitary accommodation at the Hartley Institution in that town at an estimated cost of £2,500.

The Bill promoted by the London County Council for powers to construct a subway under the river Thames from Greenwich to Millwall came on Monday as an unopposed Bill before Lord Morley's Committee of the House of Lords. The preamble having been formally proved, the committee passed the Bill as already sanctioned by the House of Commons. The subway will be constructed for foot passengers only. It will begin near Brewhouse-lane, Greenwich, and terminate near the western boundary of the Island Gardens, Poplar.

With the assistance of their electrical engineer, Mr. Thomas L. Miller, the Bootle Watch Committee have drafted a scheme for providing the borough with electricity, and they recommend the town council to apply to the Local Government Board for sanction to borrow £35,000 to cover the estimated cost.

The Bill to abandon the undertaking of the London, Walthamstow, and Epping Forest Railway Company has been withdrawn, the lenders of the amount required for the Parliamentary deposit (who caused the Bill to be presented) having been repaid.

PARLIAMENTARY NOTES.

LONDON COUNTY COUNCIL IMPROVEMENTS.—A Select Committee of the House of Lords began on Monday the consideration of the London County Council (Improvements) Bill. Mr. Freeman, in opening, said this was a Bill to empower the carrying out of three distinct improvements—(1) the construction of an approach to the Tower Bridge on the north similar to that on the south side, which is now being carried out—this portion of the bill was now unopposed; (2) the widening of the Tottenham Court-road at the Oxford-street end at Bozier's-court; and (3) the widening of the Strand by the removal of the block of buildings between the two churches of St. Mary-le-Strand and St. Clement Danes.—Mr. Andrew Young, valuer to the London County Council, gave formal evidence as to the Bozier's-court improvement. In his opinion, the Oxford Music-hall was a proper subject for the improvement charge. The removal of the block of buildings would give further advertisement to the hall by enabling the entrance to be seen from the Oxford-street crossing. Evidence was given as to the improvement which the sweeping away of these buildings would be to the Oxford, and rebutting evidence was given on behalf of the Oxford (Limited).—The Chairman announced that the committee were of opinion that the Oxford Music Hall should be included in the improvement area. The committee also decided that Mr. Schmar, photographer, Tottenham Court-road, must go to arbitration under the general Act. The petition was then proceeded with of Mr. Roberts, the owner of some of the condemned property in the Strand, who contended that he would be hampered in dealing with his property until the County Council actually took it, and who, therefore, sought special compensation. After legal argument the committee decided that this case, too, would be covered by the general law. The preamble was then declared proved, and the clauses were adjusted.

LONDON COUNTY COUNCIL (GENERAL POWERS) BILL.—The same committee then proceeded to consider this Bill. Mr. Pope explained that the object of the Bill was to widen Long-lane, Borough, eastward from St. George's Church to Crosby-row, by taking property on the south side of the thoroughfare, and at the same time to construct a spur-street running from High-street, Borough, on the north side of St. George's Church, to Long-lane. Dr. Burke, who occupied a house which was involved in the scheme, held that the Bill did not provide him with sufficient compensation. The committee eventually decided against Dr. Burke, and, formal evidence as to the remaining provisions of the Bill having been adduced, the preamble of the Bill was found proved.

PROJECTED IRISH RAILWAYS.—Mr. Gerald Balfour made a general statement on Monday night respecting the application of moneys under the Railways (Ireland) Act, 1896. A narrow-gauge railway from Buncrana to Carrdonagh, Co. Donegal, a distance of 18½ miles, had, he explained, been certified for by the Lord Lieutenant, reported on by the Board of Works, and approved of by the grand jury of the county, who had presented for a sum of £5,000 in aid thereof. Arrangements had been made for its future working and maintenance, free of cost to the county, by the Londonderry and Lough Swilly Railway Company, who were to equip the line fully with rolling stock at a cost of not less than £10,000. This railway would serve the greater portion of the peninsula of Inishowen, and would develop the fish and shirt industries in the district and the trade in bog ore and kelp. At the ensuing summer assizes for county Donegal it was intended to submit to the grand jury for their approval proposals for the construction of a railway from Letterkenny through the most congested districts of North-West Donegal to the districts known as "The Rosses." The length of the railway would be 50 miles, and the Londonderry and Lough Swilly Railway had undertaken to work and maintain the line when made free of expense to the county.

The new English Presbyterian Church, St. Columba's, Smithdown Gate, Sefton Park, Liverpool, was dedicated on Friday evening. The church will accommodate about 600 persons on the ground floor, and 100 in the gallery. The building is lighted throughout by electricity. The architects are Messrs. Woolfal and Eccles, of Liverpool, the contractors being Messrs. Morrison and Son, of Wavertree.

On Saturday a special service was held at the church of St. Andrew, Derby, at which the stained-glass west window (a memorial of the ministry of Robert Hey, vicar 1878-94) was unveiled. The window, which is the work of Mr. F. Holt, of Warwick, represents the Benedicite. The artist has treated the subject allegorically, the twelve angels in the two side lights symbolising "The Winds of God," "Showers and Dew," "Green Things upon the Earth," "Fire and Heat," "Light and Darkness," &c.

WATER SUPPLY AND SANITARY MATTERS.

LEEDS.—For some years past the city council have, says the *Leeds Mercury*, been aware that the sewage of the city was not effectively treated at the works of Knostrop. They have also been cognisant of the fact that a considerable volume of water, laden with impurities, has been poured into the already-polluted river Aire. Within the last three years the West Riding Rivers Board have frequently urged that this state of things ought not to be allowed to continue in a large and enterprising city like Leeds. As their early appeals produced no result, their later representations have partaken somewhat of the character of mild threats, and the corporation, knowing the powers which the Rivers Board possess in these matters, have at last felt it expedient to make a move. At the March meeting of the city council it was resolved, after a long discussion, to accept the tender of Mr. Isaac Gould for constructing seven additional settling tanks and raising the level of one of the existing tanks at the Knostrop Sewage Works, at the sum of £27,991. The chairman of the sewerage committee pointed out that about twenty million gallons per day passed through the works. The present tanks only held 2½ million gallons; the additional tanks proposed would provide accommodation for another 2½ million gallons, and would permit the necessary time to elapse for precipitation. The corporation were bound to do something; the West Riding Rivers Board compelled them to take immediate action. If they did not put down additional tanks, then they must at once provide a better and more costly precipitant, the cost of which would be from £15,000 to £16,000 a year. The filtration experiments that are being tried at Barking, where sewage is being treated biologically—by a system in which certain harmless bacteria are introduced into the effluent which destroys the poisonous bacteria, formed the subject of a lengthy discussion at a meeting of the Sewerage Committee on Monday last, and it was eventually resolved to take the advice of an expert as to the best system to adopt for effectively treating the sewage of the city. It was pointed out that the varied character of the trade effluents which found their way into the sewers might not be favourable to the adoption of the biological treatment referred to.

SALFORD TAKES AN INDEPENDENT COURSE.—A special meeting of the Salford Town Council considered on Monday a report of the River Irwell Conservancy Committee relating to the disposal of the borough sewage. Disapproving of the scheme prepared by the borough engineer, which the council has already adopted, the Local Government Board has withheld its sanction to an application for power to borrow money for its execution. The opinion of counsel (Mr. Fletcher Moulton, Q.C.) has been obtained favourable to the corporation borrowing money for the purpose in view, without the Board's sanction, under section 235 of the Public Health Act, 1875. After some discussion, the council decided, by 18 votes to 10, in favour of borrowing £80,000 for the purpose stated without reference to the Local Government Board.

SOUTH LONDON WATER SUPPLY.—A Select Committee of the House of Lords, on Tuesday, gave formal sanction to the Southwark and Vauxhall Water Bill—a measure which is intended to enable the company to take legally from the River Thames the quantity of water which they are at present taking illegally. The company need some 40,000,000 gallons daily, and they thought they were entitled to take that or whatever quantity they required; but in January last an injunction was obtained by the Thames Conservancy Board restraining them from taking more than 24,500,000 gallons daily. The present Bill, which is purely a temporary measure, will be operative for only two years, it being obligatory on the company to come to Parliament next year with a comprehensive scheme, when all matters in difference will be open for full discussion.

It appears highly probable that the proposal to erect a Protestant cathedral in Belfast will have to be abandoned, as funds are not forthcoming. The plan prepared by Mr. Thomas Drew, of Dublin, as adopted would involve an expenditure of £100,000; but towards the cost of the first section, estimated at £20,000, after the greatest energy in canvassing, only £8,000 has been promised. It is now proposed to throw over the grandiose project, and to provide a central church at a cost of from £7,000 to £15,000.

Mr. James Edmeston, F.R.I.B.A., writes:—The marble group called "Charity," which was executed by the eminent French sculptor, M. Dalou, and erected at the rear of the Royal Exchange, was found to have suffered greatly from the weather, and the only thing that could be done was to use the marble as a model, and to cast the group in bronze, which has now been done by Mr. Moore at his foundry at Thames Ditton. The weather has no effect on the bronze, which will, the Deputy of Broad-street Ward predicts, be as sound 500 years hence as it is to-day.

Our Office Table.

MR. BALFOUR made the satisfactory announcement in the House of Commons on Monday night that although there was no legal objection to the proposed removal of Captain R. R. Burges's monument from its position in the south aisle of St. Paul's to the crypt of the cathedral, in order to make room for the Leighton Memorial, the Dean and Chapter, after reviewing all the circumstances of the case, had decided not to remove it. Thus all's well that ends well.

YET another watering-place is projected to be created on the North Kent coast. The site this time is the freehold manorial estate of Leysdown, which, embracing about 1,087 acres, forms the north-east corner of the Isle of Sheppey. It has a foreshore of nearly 1,700 acres, over three miles of sea beach, and contains two coastguard stations. The estate, which is to be sold by auction at the Mart, Tokenhouse-yard, on Friday in next week, is now chiefly laid out in meadow pastures, and a considerable portion lies high and enjoys fine views of the German Ocean. It is also pointed out that a new railway is in contemplation connecting Queenborough with Leysdown, and that several boats pass within a short distance, the services of which, when Leysdown is developed, there ought to be no difficulty in obtaining.

At the distribution of the prizes, &c., at King's College, by Sir Owen Roberts, D.C.L., the chief prizes in the Arts Division were taken by sons of members of the architectural profession. The Jelf Medal was awarded to Mr. Gilbert Lovegrove (only son of Mr. Henry Lovegrove, F.S.I., Vice-President of the Society of Architects, and district surveyor of South Islington and Shore-ditch), who took also the Special Prize for Ancient History and English Literature; and Mr. Chas. W. Chastel de Boinville, who took the Brewer Prize for Modern History, the Barry Prize for Divinity, and the prize for French Literature (son of the late Mr. de Boinville, A.R.I.B.A., of H.M. Office of Works).

The first step in the direction of providing Peterborough with a more adequate town-hall and municipal buildings was taken on Friday in last week, when the corporation of that city considered in committee a sketch-plan submitted by Mr. Walshaw, the borough surveyor. The scheme embraces a give-and-take proposal—that of throwing a portion of the site of a tenement in Exchange-street into the Market-place, and annexing in its stead a portion of the Market-place. A square, with frontage 85ft. by 60ft., will then be available for building over. On the ground floor a butter cross, 42ft. by 33ft., can be provided, together with convenient mayor's parlour, committee rooms, porter's room, &c. On the first floor will be the council chamber, also 42ft. by 33ft., with other offices, &c., for the officials in the various departments. The plans were generally approved; but some members thought the scheme hardly extensive enough. A sub-committee of nine members was nominated to consider the whole question, and report to the general body.

A DEPUTATION from the Manchester and Salford Sanitary Association waited on the gas committee of the Manchester City Council, on Friday, and presented a memorial expressing concern "at the growing practice of municipal gas committees and gas companies using water-gas as an ingredient in the composition of gas for illuminating purposes." The product was declared to be very poisonous. Mr. Alderman Gibson, chairman of the committee, said it was water-oil gas, and not water-gas, which the committee proposed to introduce in a small proportion with the coal-gas. This was commonly done here and in America, and there had been no evil results, while the convenience to the public had in various ways been great. Water-oil gas was very quickly manufactured, and by laying down the plant proposed the committee would be able to cope, as they were not now able to do, with the demands made upon them on a succession of foggy days.

In a letter to a Newcastle newspaper, the Marquis of Londonderry points out the necessity for greatly enlarging Seaham Harbour and developing the collieries. His Lordship proceeds:—"In order to keep pace with the times there can be no doubt that developments of the harbour and collieries are very desirable. I have a very large capital invested in my present

undertakings, and I feel that it would not be prudent for me to increase my responsibilities. The tendency in the present age is to form large undertakings into companies with limited liabilities. I have given instructions to have plans prepared for the enlargement of the harbour with an estimate of the cost; this work will be undertaken by Mr. H. H. Wake, engineer to the River Wear Commission, and I have requested Messrs. Geo. B. and T. E. Foster, and Messrs. William Armstrong and Sons, eminent firms of mining engineers, to make valuations of the collieries and other works in which I am interested, and as soon as these are completed it is my present intention to offer the whole to the public and form a limited liability company. I shall myself retain a very large interest in the properties."

MEETINGS FOR THE ENSUING WEEK.

TUESDAY.—Annual Meeting of the National Master Builders' Association at Bristol.

SATURDAY (JULY 24).—Society of Architects. Day Visit to Canterbury. Train from Victoria Station, 11 a.m.

Trade News.

WAGES MOVEMENTS.

BURY, LANCs.—The plumbers in the Bury district have obtained an advance in wages of a halfpenny per hour.

DUNDEE.—The members of the Dundee district of the Scottish National Operative Plasterers' Federal Union have made application for an increase of wages to the extent of 3d. per hour, the present rate of pay being 8½d. per hour. According to the rules of the Union, a six months' notice has to be given on either side, so that, in the event of the increase being granted, it will not come into operation until the 1st of January next. As yet no reply has been received from the employers.

EXETER.—Three employers have accepted the men's demands, so that the extent of the dispute is gradually being decreased. Other batches of bricklayers and masons have left the city this week for various destinations where work has been found for them. This reduces the number of men now out to about fifty, and negotiations are in progress from which it is expected that more will be despatched to other towns in a day or so. The bulk of the men sent away will obtain higher wages than are being sought for at Exeter.

FLEETWOOD.—The plumbers of this port are on strike because the masters will not sign the rules.

LIVERPOOL.—Owing to the strike of plasterers which has existed in Liverpool for some weeks past, the whole of the building trade is affected, and building operations in the city are now almost at a standstill. The Liverpool Master Builders' Association state that they are willing to appoint a board of conciliation on the lines suggested by the men. They point out that the men have hitherto persistently declined arbitration. The master builders have also issued a circular, showing the concessions which they are ready to make. They are willing to give the following rate of wages to the several trades:—Wages shall be paid by the hour, all the year round, at the rate of: carpenters and joiners, 9d. per hour; bricklayers, 9½d.; slaters, 9d.; plasterers, 9½d.; plumbers, 9d.; painters, 8d. With regard to apprentices, they propose that all apprentices after three months' trial be legally bound for not less than five years. Before the dispute commenced, the men state, there were 400 plasterers and 150 apprentices and improvers in Liverpool.

OPERATIVE BRICKLAYERS' SOCIETY.—On Saturday the London Order of Operative Bricklayers' Society held their annual demonstration in Manchester. A large number of the members assembled in Albert-square and marched to the Belle Vue Gardens. There, after tea, a meeting was held, under the presidency of Mr. F. M. Farlane. It was stated that the Society has 27,000 members, with funds amounting to nearly £70,000, and has close upon 300 branches. Mr. John Batchelor, the general secretary, urged upon the members the necessity of strengthening their union. If trade-unionism was to be successful, the unions must be larger and stronger. Small unions were useless, and he hoped that one day there would be but one union in the building trade. He asked that support should be given to the scheme for the provision of cottage homes for aged members. Representatives from London, Leicester, Warrington, and other towns were present at the meeting. Next year the society will celebrate its jubilee, and a demonstration will be held in London.

PRESTON.—The strike of bricklayers at Preston, which occurred about three months ago consequent on a demand for an increase of wages from 9d. to

10d. per hour, has been settled. The men have been granted the additional 1d. per hour; but the employers' stipulation for an alteration in the rule with respect to apprentices has also been conceded. Formerly an employer was allowed to have only one bound apprentice, but under the modification of the rule all lads working will be bound.

THIRSK.—A meeting of bricklayers in Thirsk and Sowerby was held on Friday night at the King's Head Hotel, Thirsk, for the purpose of considering an advance in wages. Up to the present 5½d. per hour has been paid, and the men wanted 6½d. per hour. The masters would not accede to the request, but offered an advance of 1s. per week, which the men refused to accept, and they accordingly ceased work.

CHIPS.

In the House of Lords on Tuesday, the Patent Office Extension Bill and the Public Office (Whitehall) Site Bill passed through Committee and were reported without amendment.

The Howrah House, Poplar, London, is being warmed and ventilated by means of Shorland's patent Manchester stoves and grates and special ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Dr. Temple is resolutely putting the Archbishop's house in order. He has resolved to spend £5,000 in improving the drainage, some portions of the system being nearly as old as the Palace.

The 17th-century brick houses occupying the site of Nos. 10, 11, and 12, Walbrook have just been replaced by a Portland stone fronted block of offices, built from designs by Mr. Delissa Joseph, and known as Brook House. The building contains 52 rooms, let out in suites of offices, and fitted with the electric light. Messrs. J. Allen and Sons, of Kilburn, were the builders.

THE BUILDING NEWS

AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2220.

FRIDAY, JULY 23, 1897.

PRACTICAL DETAILS OF BUILDING.

COMPROMISE is a powerful factor in the relation between architect and contractor. The give-and-take principle may be a useful means of transacting business; but in art matters it does not answer, for it generally means a giving up of something, or a "watering down" of the artist's intentions. And yet the "put-off-with-something-equal" policy has ruled in many of our great buildings. All great architects in ancient and modern times have had to give up something. It is a matter of history that the design of Wren for the rebuilding of St. Paul's had to be abandoned for a less magnificent scheme. Inigo Jones had to considerably modify his plans for the design of the palace at Whitehall; and in our own day Barry's design for the Houses of Parliament underwent many prunings and amendments, as we know the more recent works of Scott and Street did, as in the Government Offices and Law Courts. In short, very few of our great public edifices have been carried out in the spirit of their designers. The exactions and whims of clients have nevertheless not been half so prejudicial to the architecture of our time as the modern contract, which imposes on the architect conditions that favour low tendering. Of what value are saving and arbitration clauses when a tender has been accepted which renders honest building out of the question? Where is the *Non possumus* of the architect? The only reply of the builder-contractor is: "We give you something that is equal." Compromise is an easy way of defeating the architect's intention. How to make the necessities of plan and construction architectural is a matter that cannot be left to chance. As a rule the profession are inclined to trust too much to the contractor and to those engaged in carrying out his intentions. They are afraid to impose conditions of design which may be costly or uneconomical, or, for example, they prefer that the engineer shall make his own arrangements and structural provisions to save the trouble of considering a number of details of which he is not cognisant. The consequence of this apathy is that the engineer is allowed to do what he likes in the way of altering the design to suit his particular work, rather than spend a few hours or minutes in considering how he can make his work or fittings conform to the design. And this surrender on the part of the architect to the engineer's free choice may make all the difference between a pleasing architectural design and a hideous structure. The apathy of the one and the desire to make a profit by the contracting firm are the combined enemies to good architecture; they are the conditions which obtain in all large buildings and contracts, and render it so hard for the architect to realise his design in bricks and mortar. Buildings designed for utilitarian purposes, like hospitals, workhouses, and business premises, are mainly in the hands of contractors, engineers, plumbers, and manufacturers. The architect has prepared plans and designs for the building, but the before-mentioned officials step in and carry out the work. Each branch falls into a particular groove, the brick and terracotta is regulated by the makers and the patterns in stock; or the time precludes special moulds being made for the work; the iron joists and columns are supplied by the iron merchant, there is no time to make special patterns, and the details devolve on the superintendent or clerk of works.

If the architect submits designs for the columns, brackets, spandrels, they are set on one side as expensive, or impracticable; the plumber introduces the fixtures he has in stock, and the shopfitter, the electrician, the decorator, each comes in, and on various excuses sets to work in his own way. Is not this the way the big contract job is carried out? Let those who have had any experience say. A great deal goes by the board; there is a back way of introducing things, which the architect scarcely understands; and is not his and the contractor's way very far from being the same? The one looks at the design, the little details of moulding or finish, the other at the number of feet, cube or superficial, of material, and the labour in the work. A few thousand feet of framing or window sashes of the same pattern is a matter worth fighting for, if only the architect's conscience or whim can be salved; if he can only be induced to give up those tiresome little details for doors and panels and joinery which he has furnished. Is it not also much easier and cheaper to order a few thousand feet of the same moulding, and to use it for all purposes? The same brick mouldings will do throughout the buildings for windowsills and dressings, band-courses, and cornices; the same sash or iron casement can be used throughout the building. It is impossible to reconcile such commercial ideas of production with the architect's views. Who can expect such diverse ideas of building to lead to success? There are some features that are intractable, which cannot be made architectural under the conditions which prevail. They no doubt are utilitarian; use or necessity are at the root of them. The factory chimney is one. We seldom manage to make it architectural, very rarely pleasing. The factory engineer comes in and attenuates it, or gives it a rigid-lined tapering form with an ugly summit that is a lasting eyesore against the sky, or to hide what the factory-builder considers necessary, the architect attempts a compromise which is much worse. Instead of a plain brick stalk, which offends no one, the structure is cased by a square tower to a certain height, which is finished by a cornice or with pinnacles, and the inner shell goes up like a sliding pencil-case on end, an outline quite indefensible and ugly. Or, what is quite as bad, the chimney is disguised and made to appear a tower or Italian campanile, like that on the Grosvenor-road pumping-station, the Lambeth Waterworks, or the sewage outfall works, a form that is meaningless for conveying away smoke, besides being a satire on our architectural taste.

Take, again, the water tower as we see it treated in any large group of buildings like a hospital or an asylum—a feature that might, and ought to, be made something of. Between the water engineer, the water company, and the contractor, the architect has very little to do with the result. In the bird's-eye view of the design it appears an artistically-treated and handsome feature, if a little ill-considered for the purpose; the actual structure is a bare, stumpy tower, with a huge tank at the top like a locomotive feeding-tank. Of course, we do not mean to infer that a water-tower should represent any other structure, or that the existence of a great tank at the top should be suppressed; but such a use can be made conformable with good proportion and detail. We do not look for a church tower or an Italian campanile, or a square tower with a belvedere, or clock-dials on each face; but at least it can be made an architectural feature, and at the same time showing its character. But, instead of this, the architect gives it away to the engineer, or is so hampered by the structural details that are forced upon him that the water tower is often so spoilt as to become an erection that is better concealed

than made an object of interest. We saw the other day in connection with a large hospital a water tower that was simply treated; but the upper story was made slightly larger than the tower below, with a balcony round it, but which had evidently been spoiled or denuded of its details in being carried out. The original design lost its character in the process of building.

Take another instance: a hospital pavilion. We do not expect much from so plain a building. The very conditions of health necessary to be observed render it a hard building to treat architecturally. The only features which the architect can turn to account are the ends with the detached or angular towers for lavatories and conveniences, and the balconies for convalescent patients which are sometimes provided between them. But take any dozen of our recently-built hospitals and see how few of them, if any, are carried out with a due regard to architectural effect. Any external dressings or features, the converting the angle-placed tower into an octagon at the top, or of making its windows and roof a little more finished and decorative, are very rare. In most cases these semi-detached towers are built with extreme plainness, the pyramidal roofs are shorn of decent proportion and finish, the windows are mere slits in the wall, and the balcony railing has a bare, impoverished look, being made of iron bars. They are more worthy of a back yard than the main front to a row of hospital pavilions. In eight or a dozen pavilions the extra labour of making them ornamental features, small as it seems, may make all the difference between the highest and lowest tenders. The architect cuts out the items of string-courses or stone dressings, or tile roofs and finials, and the contractor does his best to reduce their design still more, and the result is crude and ugly. Nothing spoils so quickly as a contractor's method of cheapening: it means not only denuding of extraneous details, but making everything flimsy and thin. Iron-work is one of the many details of a building which cannot bear this process with impunity. What looks meaner than the substitution of half-round guttering for the ogee section, the reduction of an inch or two in the diameter of an iron column, a plain bar of iron for turned wooden ones in balconies and fencing? No architect would prefer to substitute an iron truss roof for a timber one over any building which could be equally well served with timber as with iron. The reduction of the scantlings of a timber roof is one of the favourite devices of the modern contractor. He looks upon it as a perfectly honest and legitimate means of bringing down his tender, or, it may be, of making the quantity of timber given square with the actual demand. When the architect winks at this course the case is hopeless, as it means degradation throughout, an elimination of every decent detail of the design.

Again we have the common sash window. It seems to be one of the compromises between the old casement and mullion window, and the old sliding thick-bar sash of the last century. As containing the minimum of woodwork with the largest glass surface, it has found its way into popular favour. Little architectural effect can be obtained by it. The contracting builder has made it his own, for it is one of the items which can be multiplied. The architect may show thick sash-bars and mullioned openings in his elevations; but the builder manages to put in the ordinary sash window, and in a large building may make every aperture a multiple of all the rest. Every designer will admit that the common thin-barred sash gives a very depressing appearance to a building; nevertheless, it is one of the many stock items which the contractor turns to his own advantage. We have seen many designs in which the windows are shown filled with sliding sashes or casements with transoms,

a style of window eminently suitable to buildings of the Renaissance character; but in execution the ordinary sash has been substituted, probably because a little saving has been effected. Many other features may be instanced to confirm the same compromising spirit in the carrying out of our large contract buildings. The architect's skill may be unquestioned; but it is often baffled by circumstances over which he seems to have little control.

HAND AND EYE TRAINING IN THE LONDON BOARD SCHOOLS.

WHEN so much has been said about technical education, it is of some interest to inquire—How the experiment of providing for technical instruction in our Board schools is working? An exhibition of a very interesting kind was opened last Friday for a few days at the Hugh Myddelton School, Clerkenwell, by Lord Londonderry, including drawings, designs in paper and colour, modelling in clay and cardboard, woodwork, needlework, and other branches sent in by the various schools of the Board. The chief principle which has been kept in view by the promoters of this scheme is that the work given to the pupils is disciplinary only, or as training for the hand and eye, and is not intended to instruct the pupils in a trade or to come into conflict with the crafts. The importance of this rule must be acknowledged in the interests of the trades. It has been thought by many that technical training in the schools was for the purpose of teaching boys a trade, a mischievous notion which would be suicidal to the whole scheme. The exhibition at the Hugh Myddelton School will at once show the object of the promoters. Here we have brought together in two or three rooms the work done by the London Board school children. In the kindergarten section we see specimens by 52 schools, representing some three or four thousand infants and junior boys and girls; but we chiefly draw attention to the technical knowledge exhibited in the paper and woodwork specimens. The exhibits showing designing in coloured paper in the "hand and eye" section are interesting, as they prove how easily young children can be taught the rudiments of form, and colour, and design on flat surfaces. We see here some very carefully-executed designs in squares and tesserae, some by overlays of paper of different colour. In a more advanced stage we notice design in colours, and one or two examples of bold designs for friezes and borders, by Frank Jolly, of the Minnow-road Schools. The "brush-work" designs are interesting, and develop a freehand for decorative work. Modelling in cardboard of solids and various objects is another good exercise, as it tends to draw out the pupil's power of conceiving form in solid geometry or stereography, and helps him in his geometrical studies. Many of the clay models show artistic perception.

But we particularly call attention to the woodwork exhibits, which occupy two or three large tables. We were shown by one of the instructors the courses of exercises given to the pupils who go in for this branch of handicraft. There are several of these graduated exercises, beginning with the simplest operations intended to teach the pupil the use of the rule—in setting-out grooves, at right angles and obliquely. In these beginning exercises, which are illustrated by models, the youthful student begins to learn the use of the gauge, chisel, plane, and to apply them to simple grooving, housing joints, chamfers. He goes on to more advanced objects in which all these initiatory operations are combined with curved lines. The centre-bit and other tools come into play. We see lamp or dish mats with different coloured woods, with their edges shot, glued-up into elliptical shapes;

letter-racks, inkstands, &c. A second year's course continues the same operations, but applied to more complex articles, like brackets, shields, trays, knife-boxes, inkstands, and the like, a development of the same principles being made in ever fresh stage. The student is also taught economy in the use of stuff. Thus we see a bracket turned out from one piece of board, planed up to a certain thickness, which is divided and cut for the projecting shelves and bracket supports. The shields cut out of soft wood are exercises intended to teach the pupil correct outline and the development of curves. The shape of the shield and its curved surfaces illustrate a more complex development of curves, which in some specimens is finished by the use of sandpaper. A more advanced course shows the making in a more complete and finished manner of similar articles: boxes, stools, book-racks, brackets, trays, inkstands, and other ordinary articles. Every pupil must accompany his specimens with drawings to scale, without which the work done is not accepted. From these remarks it will be seen that the student is first taught the simplest abstract principles of the craft, and afterwards the complex and concrete. The groove leads up to the inlay of different coloured wood, or to the simple housing joint, and these in their turn lead up to mitre and dovetail joints and more complex developments. The examples we see on the tables of boys' work show that these general principles have been followed. A very favourite simple exercise is the dish-mat of oval shape with pieces of dark walnut let in; other specimens show chess-boards, star devices on flat surfaces, in all of which edge shooting is the chief operation. Examples of inlay designs are numerous. One or two very excellent examples of inkstands with curved edges show an artistic sense of curvilinear form. One young lad sends a revolving bookcase, which is very ingenious, and carefully executed; and we see also specimens of knife-trays, boxes, and other useful articles. These articles are mostly executed in basswood or a white, soft, even-grained wood, the other woods used being ash, sycamore, American walnut, and Honduras. The Hazetone-road Lower School sends several creditable specimens.

The exhibits of the evening continuation schools are more varied, and greater latitude is allowed the pupils. The drawing from models and the specimens of wood-carving, chiefly panels, the models of objects of a constructive kind, like a pile-driving machine, are very creditable instances of industry and applied skill. We may also refer to a few examples of beaten copper or *repoussé* work, and to the stumping in coloured chalk. The drawings shaded from models and the cast and those of natural flowers comprise several creditable examples. The needlework section is a large and admirable display of the girls' work. Looking at the exhibition generally, the work done by the pupils shows a great improvement on past efforts, and prove that under the system introduced it may fairly be said that we can show quite equal, if not superior, results to those of the Continental schools.

THE NATIONAL ASSOCIATION OF MASTER BUILDERS AT BRISTOL.

THE members of the National Association of Master Builders of Great Britain held their half-yearly meeting in Bristol on Tuesday. The proceedings were opened by a gathering at the Guildhall, under the presidency of Mr. Thomas F. Rider, of London. The following delegates were present:—S. Ambrose, Bath; Atherton, Bolton; F. G. Barnes, Dorset; A. Brown, Derby; Councillor J. Bowden, Stoke-on-Trent; John Biggin, Sheffield; President W. Bowers, Hereford; C. H. Barnsley, Birmingham; R. Bevers, Hull; Stanley G. Bird, London; Alderman John Bowen, J.P., Birmingham; James Beckett,

Dublin; W. Blackburn, Newport, Mon.; Joseph Bell, Saffron Walden; W. Church, Bristol; J. Howard Colls, London; W. Cartledge, Burslem; Henry Cave, Wolverhampton; W. Cunliffe, Bolton; Alfred Crowther, Huddersfield; M. Carine, Douglas; R. C. Cock, Wells; J. Dickinson, Derby; G. Durant, Derby; P. Drake, Bradford; John Dawson, Bradford; J. Davis Hereford; J. Dimeckley, Northampton; J. Dawson and wife, Huddersfield; — Dapthorne, Plymouth; W. Dyer, Weston-super-Mare; Councillor W. Dunk, Barnsley; C. Dye, Southsea; J. H. Ford, Burslem; G. F. Fisher and wife, Northampton; C. Garlick, Coventry; W. Grant, Burslem; H. Gough and wife, G. Gough, Wolverhampton; Y. Goates, Hull; H. Green and wife, Northampton; C. W. Green, Liverpool; W. Green, Cardiff; J. A. S. Hassall, Liverpool; Chas. H. Haywood, Coventry; G. Hardington, Leicester; Ald. Wm. Holdsworth, J.P., Bradford, Yorks; L. Hodges, Hereford; J. Herbert, Wolverhampton; H. Holloway, London; R. S. Henshaw, Strand, London, W.C.; Jesse Hayward, Bath; E. Henshaw, Liverpool; R. G. Jenkins, Devonport; Ald. W. H. Jessop, J.P., and Mrs. Jessop, Huddersfield; W. Irwin, Leeds; A. Krauss, Bristol; Wm. Kitch, Bridgewater; G. Kett, Cambridge; W. P. Lewis, Hereford; A. Lynea, Walsall; W. E. Lee, Birmingham; A. Lethbridge, Walsall; C. H. Long, Bath; J. Linton, Newport, Mon.; E. J. B. Mercer, Bath; the Right Hon. Ald. Meade, P.C., Dublin; C. Myers, Leeds; J. Norwood and wife, Coventry; W. Nicholson, Leeds; Councillor L. and Mrs. Price, Stoke-on-Trent; Dyon Parfitt, Newport, Mon.; F. Pratt, Bath; S. F. Rider and wife, Southwark; Jos. Randall, London; Lewis Radcliffe, Huddersfield; Robert Rymer, Barnsley; W. Sapeote and daughter, Birmingham; W. E. Starkey, Leicester; John Spink, Sheffield; T. Skett, Wolverhampton; Wm. Shepherd, London; H. J. Spiller, Taunton; W. Symond, Cardiff; Wm. Townson, Bolton; J. E. Turner, Cardiff; Councillor E. R. Taylor, Barnsley; T. Vincent, Bath; R. Weston, Derby; John Walker, Derby; — Wistance, Walsall; W. E. Wooster, Bath. The Bristol Association was represented at the meeting by Mr. A. Krauss, president; Mr. Wm. Church, vice-president; Mr. George Humphreys, treasurer; Messrs. Geo. Wilkins, E. Walters, G. A. Hayes, J. Eastbrook, J. E. Jones, C. Cowlin, J. E. Wilkins, J. E. Gosling, H. A. Forse, A. S. Scull, H. E. Thomas, H. Kepple, J. Bastow, Frank N. Cowlin, and H. J. Spear (secretary). The association was welcomed by the High Sheriff (Mr. J. Colthurst Godwin), who said Mr. Krauss, his friend, the president of the Bristol Association, had asked him to offer to the master builders of Great Britain a hearty welcome to that most ancient and loyal city. It was twelve years since their association last met in Bristol, and they had a very pleasurable recollection of that visit. Since that time very considerable progress had been made in Bristol, and although they did not go ahead there with the pace that other towns did, yet their trade was as safe and sure as in any town he knew of. They would notice some improvements in Bristol since last they were there. They would see that the old Drawbridge, which existed for many years, and respecting which there had been over and over again discussion in the town council, had been removed, and there was a wide way made, over which carriages could go as often as was wished. They had improvement in their buildings, and although they had Cardiff very often put up against Bristol as a rival town, yet it was satisfactory to know the imports of Bristol were larger than the imports of Cardiff. It was true that in Bristol they had a small export trade compared with Cardiff, but they had a very large import trade, and it was gratifying the imports were in excess of Cardiff, a town of which they had heard so much. He would ask them if they could not manage their contract forms, so that if builders undertook what turned out to be unfortunate contracts, the goods supplied by the merchants should not be hypothecated by their clients. He spoke as a merchant, and it seemed exceedingly unfortunate the builders did not, at the time those disastrous contracts were entered into, give notice to the merchants. When a bankruptcy occurred, the merchants were told that the assets formed part of the property of their clients. Could not the builders strike out some of the unfortunate clauses from the contracts? And as to fine, it was only weak-kneed builders who entered into those forms; but strong builders, such as

Fig. 1.

Since it is next to impossible to ascertain what the absolute amount of the loading uniformly distributed over a floor really attains to, it is necessary to assume a certain weight, and proceed with the calculations upon that assumption in determining the strength of the combined system of construction. Commencing with the floors of ordinary dwellings of a large size, such as those of flats, hotels, and others, upon which there are never

combination. These experiments, although not quite conclusive, will afford some interesting information respecting the resistance of arches built of concrete, and also serve for the purpose of instituting a rough comparison between them and other types to be yet considered. The spans are small; but as the total loads brought upon any one arch, as well as the reduction of them to their equivalent uniformly-distributed loads per

Fig. 2.

any heavy concentrated loads, the minimum weight permitted in the capital and two other very important cities in the United States is fixed at 70lb. per square foot. There is no doubt that this estimate is high, for the weight of human beings inhabiting dwellings of the description cited, together with that of their furniture, luggage, and general belongings, could not possibly average this amount. On the other hand, it must be borne in mind that the floors of these buildings are liable, although probably only occasionally, to be subjected to loads which would sensibly approach the limit laid down by the Building Laws. Again, the strength of a floor, similar to that of a bridge, cannot be determined by the average load brought upon its unit of area,

are also worked out, the corresponding resistances can be readily estimated.

TABLE III.

No.	Span.	Total Load.	Load per Square Foot.
1	4ft. 0in.	13.31	0.64
2	4 0	7.11	0.69
3	4 3	2.50	0.60
4	5 0	3.39	0.85

In Table III. the second column gives the clear span in feet and inches between the flanges of the rolled beams upon which the concrete arches rest, and against which they might abut. Both the total load and the load per square foot

Fig. 3.

but must be apportioned to carry the maximum load, whether statical or dynamical, that might, under all possible circumstances, be placed upon it. Averages, calculated from the aggregation of a comparatively large number of miscellaneous objects of widely different individual weights, are seldom trustworthy. They are very frequently as much above the actual maximum load as they are below it, the significance of the difference consisting in the fact that in the latter case the discrepancy is of no importance, whereas in the former it might be attended with very serious consequences. So far as the dead load of a floor is concerned, it must obviously be calculated for every separate type of flooring.

are in tons and decimals of tons. Of the four experiments, of which the ultimate results are recorded in the table, three of them failed, but the other, No. 3, evinced no signs of yielding. If our readers will for a moment turn back to Articles II. and III. relating to the present subject, they will be able to institute a comparison between the simple and compound systems. In the first place (see Table I. in the Article III.), the arch of ordinary bricks and that of special bricks, together with the two examples of corrugated iron arches, must be rigorously eliminated from the list, as they have nothing in common with the four tested arches in the accompanying Table III. Our attention, therefore, must be concentrated

examples of the compound system, with breaking loads of 0.69 and 0.64 tons against the arch of plain rammed concrete, with its inferior breaking weights of 0.513 of a ton.

From the evidence just adduced, it may be fairly concluded that the compound system does unquestionably possess superior powers of resistance to the simple type. It will not, however, quite do to jump to conclusions which might turn out to be too hastily formed. The conditions of testing in the two series or sets of experiments were not quite identical, and the number of them in both instances is very limited. It is illogical to argue *a particulari ad universale*, and we need further analysis, more experiments, and a greater number of results before an impartial and thoroughly reliable verdict can be arrived at, and one which, at least to a very considerable extent, will settle a question which has not yet been definitely decided upon, although the coming event is casting its shadow before.

In Fig. 2 is represented a cross-section of the arrangement for utilising the expanded metal in the construction of concrete arches. There are numerous other forms or methods used for floor-building; but the example we have selected is that best adapted for the subject we are discussing. The appearance of the diamond-shaped expanded metal is, no doubt, familiar to our readers; but we are not at present concerned with this detail, nor with the process of its manufacture, which is exceedingly ingenious, curious, and interesting. For spans exceeding 8ft. or 10ft. up to 20ft. or 25ft., arched channel steel is employed with advantage. A section of this method is shown in Fig. 3, in which A represents the rolled steel floor-girder, B is the channel steel, which is filled and covered with the concrete E, while the thick black line F is the expanded metal, which acts as a through-bond in the concrete, and, in accordance with the principle we have drawn attention to, takes up the tensile stresses which might under certain circumstances be brought upon the structure. Over the expanded metal F is laid the finished concrete floor G, with expanded metal core resting upon the arched ribs. In Fig. 4 a section through the steel channel arch is given, which requires no further explanation except to point out that the letters C and D are the temporary wood centring and lagging boards forming the necessary false work. The connection between the separate sheets of the expanded metal is made by overlapping one over the other—that is, by a lap joint. In our previous columns, putting F for the modulus of rupture, or also called the coefficient of the bending strength of the material, W equal to the weight situated at the centre of slab, beam, arch, or, briefly, any form of specimen under an experimental test, L equal to the clear span between bearings, and *b* and *d* for other dimensions of the slab or beam, the value for F was given by the equation—

$$F = \frac{3 \times W \times L}{2 \times b \times d^2} \dots\dots\dots (1)$$

and it was then stated that this value was purely an empirical one, an observation which applies not only to concrete but to steel, iron, stone, and all materials used for constructive purposes. But in all structures, whether of an engineering or architectural character—and it is becoming daily more difficult to draw the line of demarcation between them—the practical method of estimating the weight upon them seldom involves the consideration of a central or even only a single weight. Hoisting cranes, travelling gantries, shear-legs, and derricks are exceptions, and so also are columns. On the other hand, all large and important structures of more than ordinary magnitude have their powers of resistance apportioned to withstand the effect of a uniformly distributed load, or the effect of numerous concentrated loads reduced to an equivalent load uniformly distributed. The practice of employing in the calculations for the strength of both road and railway bridges, especially in the latter, the equivalent reduction of a number of rolling loads ununiformly distributed, instead of estimating in the first place their effects singly and then by integration arriving at the aggregate, is extending itself more and more. It saves a very large amount of useful time, it avoids a laborious, circuitous, and unnecessary amount of calculation, and when it does err, it does so on the side of safety.

It is an axiom in bridge and girder arch and suspension construction that a weight placed at the centre has exactly the same effect, or, in

Fig. 4.

Assuming our minimum live load at 70lb. per square foot, it will range up to twice this amount for larger and more public offices and buildings. For warehouses and stores, and where machinery and mechanical appliances are constantly employed, it may rise to 4cwt. or 5cwt. per square foot; but these are all special instances, for which not even an approximate rule can be given. They may be safely left to the experience and judgment of the superintending architect or engineer.

Some tests have been made with the modified system previously described, in which flat bars were used to further increase the strength of the

for, at any rate, the present on the first three experiments recorded in our previous article, which are the arch of rammed concrete, that of plain Monier cement, and the arch of Monier cement concrete. It was this last specimen which bore the maximum breaking load of 0.643 of a ton per square foot; but No. 4, belonging to the combined system in Table III., did not yield until the breaking load reached 0.85 of a ton. The arch of plain Monier concrete in Article III. and No. 3 in the present article may be struck out of the comparison, since their respective breaking weights, 0.593 and 0.60, are practically identical. There remains, therefore, two

other words, produces the same stresses upon the structure at the centre, as twice the weight does when uniformly distributed over it. As this statement is often accepted, as many others are without proof, it may be as well to show how the relation is established.

Let A B in Fig. 5 represent a beam, the weight of which may be neglected, supporting a single

FIG. 5.

weight W at its centre. Put L for the span of the beam, and R, R₁ for the reactions respectively at each abutment. Then, on the principle of the lever, we have—

$$R = R_1 = \frac{W}{2}$$

and as the moment of a force in the case before us is equal to the reaction multiplied by the perpendicular distance of the weight from the abutment, which distance is obviously equal to half the span—that is $\frac{L}{2}$.

Putting M for the moment at the centre, then—

$$M = \frac{W}{2} \times \frac{L}{2} = \frac{WL}{4}$$

In the second example, see Fig. 6, let M₁ = moment at centre, and let the moment be required at any point x which divides the girders

FIG. 6.

into segments a and b. Call this moment M₂. The general expression for M₂, no matter where the point x may be placed, is—

$$M_2 = \frac{W \times a \times b}{2(a+b)}$$

but at the centre of the girder $a = b = \frac{L}{2}$ and since $(a+b) = L$ the value of M₁ becomes—

$$M_1 = W \times \frac{L}{2} \times \frac{L}{2} = \frac{WL^2}{8}$$

from which we obtain

$$M_1 = \frac{WL^2}{8L} = \frac{WL}{8}$$

that is—

$$M_1 = \frac{M}{2}$$

or, inverting the former statement, the moment of a uniformly distributed load at the centre of a girder is exactly one-half of what the moment amounts to when the same load is placed at the centre of the girder. It will be found in investigating the results of future experiments in connection with the simple and combined systems, which we have not had space enough to commence in the present article, that many discrepancies exist in the tests, notwithstanding that the conditions are as precisely similar as care, skill, and supervision could make them.

Edgar Farman, who presented personally to H.R.H., the President, Mr. Robert Walker, and Mr. Ellis Marsland. H.R.H., after having shaken hands with the President, handed him Her Majesty's gracious reply to the Address of the Society, as follows:—

"On behalf of the Queen, my dear mother, I thank you for your loyal and dutiful address, and for the affectionate congratulations which you tender on the completion of the sixtieth year of her reign. It is a source of profound joy to the Queen to receive the expressions of devotion to her person and family which are offered by her subjects throughout the Empire. She is gladdened by the thought that the sixty years of her reign have been years of progress in knowledge and of increase in prosperity, and she prays that, by the blessing of Almighty God, she may always live in the hearts of her loving and beloved people."

The Society is to be congratulated upon the distinction and honour conferred upon it by her Majesty the Queen in thus receiving personally, at the hands of the Heir to the Throne, the expression of loyalty and congratulation contained in the address. The address was a beautifully-designed, illuminated document, specially prepared under the direct superintendence of Major Leslie, to whom the Council are much indebted. Accompanying the address was a list of members, specially bound in book form in vellum and gold, containing as a frontispiece a portrait of the president, Mr. Robert Walker.

[Copy of the Address to be presented to her Majesty the Queen by the Society of Architects.]

TO HER MOST GRACIOUS MAJESTY THE QUEEN.

MAY IT PLEASE YOUR MAJESTY.—The President and Council of the Society of Architects humbly approach the Throne that they may, with others of your faithful subjects, offer, with profound respect, their loyal congratulations on the celebration of the sixtieth anniversary of your accession to the throne of your ancestors. In your Majesty, as in your illustrious husband, the lamented Prince Consort, the Arts have ever found a noble patron, and the Council is, therefore, emboldened to hope that your Majesty will graciously accept this humble address in the name of the Society of Architects.

That it may please the Great Disposer of Events to prolong your Majesty's glorious reign, and to grant you every blessing, spiritual and temporal, is the fervent prayer of your Majesty's obedient and faithful subjects.

ROBERT WALKER, President.
ELLIS MARSLAND, Hon. Secretary.

PUBLIC LIBRARY ARCHITECTURE.

AT the closing meeting of the International Congress of Librarians, held at the City Guildhall on Friday, general papers on the architecture of public libraries were read and discussed.

Mr. F. J. Burgoyne (librarian of the public libraries, Lambeth), read a paper on "Public Library Architecture from the Librarian's Standpoint," dealing with the subject from the point of view that the librarian was of course chiefly concerned with the internal arrangement of library buildings. He referred to the rapid growth of libraries as showing the great importance of having the sites for library buildings sufficiently large to provide for future extensions. He dealt in detail with what his experience had shown him to be the best plans on which library buildings should be laid out, and the most suitable arrangement of rooms and shelving of the books, and also with the various systems of issue, of lighting the rooms, and of heating and ventilation. The problem, he pointed out, was different, according to the means at the disposal of the authorities. The rooms should not be too large; two or more of a smaller size were better than the same area in one room, as small rooms were less draughty and warmer. Books should be accessible without ladders, the windows should be high, the ceiling lofty, the lighting good and well distributed, skylights should be double so as to prevent the access of the direct rays of the sun, and the windows should be double where there was much traffic. If gas was used, ventilating shafts should be provided to carry away the fumes, and some form of incandescent gas should be employed. The Aberdeen public library was a model of what such a library should be.

Mr. Beresford Pite, F.R.I.B.A., followed with a paper on "Library Architecture from the Architect's Standpoint." He regarded a library building as an extended bookcase with mechanical functions, but he also considered that as a good book deserved a good binding, so a good collection of books deserved a good building. From this arose the æsthetic function—the providing of a library building most fitting for the expression of

pleasure in construction and design. He went on to make a number of suggestions for such design. Such a building should be marked by dignity, simplicity, and restraint, and the ornamentation of the various rooms—the reading-room, the entrance hall, &c., should be in fitness with the uses to which the rooms were put. He dealt with the proper use of decorations as opposed to their abuse, and then described at length the various architectural styles that had been adopted for libraries, from the philosophic Greek to the romantic Gothic. He concluded by describing what he regarded as an ideal building for a modern public library.

In the discussion which followed, Mr. Crunden, Dr. Justin Winsor, and others, expressed their opinions on the most desirable appliances for heating, ventilation, and other matters. The chairman, the Earl of Crawford and Balcarres, gave an account and criticised the lighting and ventilation of the Houses of Parliament. Sir H. Howorth, M.P., said the question was, Are the books meant for the library or the library for the books? In his view the librarian ought to arrange his books, whereas generally a library was intended mainly to glorify the architect. Smirke's room at the British Museum was an admirable example of the adaptation of a room to its use. Mr. Dewey said the most conspicuous failures had been the libraries at Boston and Chicago, on which a mint of money had been spent. In designing a building, the best thing would be to compile a list of things to be avoided, and if such things were avoided, the best conceivable plan would be found to be the residuum. Dr. R. Garnett said that to him many years ago an empty shelf was a much more beautiful object than a full one, for he had no place for the ever-accumulating mass of books. But now he had not the same satisfaction at unoccupied space which he used to feel, for the sliding press had, in the economy of space effected, been a veritable boon to the librarian. It would be a good thing if the architect would subordinate all æsthetic considerations to practical requirements, and would make his plans not only for the present, but for the future.

THE BRITISH SCHOOL AT ATHENS.

THE annual meeting of the subscribers to the British School at Athens was held on Thursday in last week at 22, Albemarle-street, Piccadilly, under the chairmanship of Sir Edward Poynter, president of the Royal Academy. The report stated that, in spite of the political disturbances, culminating in the disastrous war in Greece, the British School in Athens had had a very satisfactory session. The number of the students had been considerably above the average, and good work had been done. The students' hostel had now become an accomplished fact. The total cost of the building and furnishing would be about £1,500; £1,000 had been subscribed, and further subscriptions were asked for. The report spoke of the high value of the excavations which had been made. The Government grant for five years of £500 a year had been ratified by the House of Commons, and the first instalment had been paid. The President, in moving the adoption of the report, referred to the success of the school during the past year, adding that it was evident, however, that that school still stood in need of considerable assistance if the work it had to do was to be efficiently carried out and further developed in the direction of usefulness. An important step in this development was in the establishment of an hostel for students. This would be ready to receive students when they went out next session. Mr. Cecil Smith and his colleagues had got nearly £1,100 in subscriptions, and the other £400 was to be provided from the school fund. It was to be hoped that some liberal person would provide the balance. The good work which the school had achieved was seen from the directors' report. It was difficult to resist the hope that at some future time the funds of the school might place the directors in a position to purchase a site in the modern part of Athens, where excavations might be made. The Government grant of £500 a year—given through the liberality of Sir William Harcourt—had been of great value, and it was to be hoped that it would be continued after the five years' limit. He hoped the operations of the British school and the foreign school in Athens might lead to the foundation of a University of Archaeology. Professor Percy Gardner seconded the adoption of the report, which was agreed to. Mr. Cecil

THE SOCIETY OF ARCHITECTS AND THE QUEEN'S DIAMOND JUBILEE.

THE presentation of the Congratulatory Address to Her Majesty the Queen by the Society of Architects took place on Wednesday last, at St. James's Palace. Her Majesty having consented that the address should be presented personally, deputed H.R.H. the Prince of Wales to receive the same, at the hands of the President and a small deputation, on her behalf. The Lord Chamberlain notified to the Society Her Majesty's desire that six members should attend at St. James's Palace as a deputation for the above purpose. The deputation consisted of the president, Mr. Robert Walker, J.P., of Cork; Mr. Walter Emden, J.P., L.C.C.; Mr. Henry Lovegrove, A.R.I.B.A.; Major F. S. Leslie, R.E.; Mr. Edgar Farman, and the honorary secretary, Mr. Ellis Marsland. The deputation was introduced to H.R.H. by Mr.

those in Bristol, drew their line through it, and as to a fine, it was only country builders who entered into that form. Then as to excessive competition, he could not understand when they found the highest tender £20,000 and the lowest £10,000 how the man who did the work at the latter price could get a profit. He was glad to see that not only were the Bristol builders receiving the National Association, but the Bath builders were also going to welcome the association. The builders of both cities were on the most happy terms.

Mr. Rider, on behalf of the National Association, thanked the High Sheriff for the welcome which he had extended. That was not the first or second visit of the association to Bristol, and amongst all the various places in England there was none from which they carried back more pleasant recollections than the ancient city of Bristol. There was an element of sadness in their gathering that day, as most of them recalled their distinguished past president, Mr. Cowlin, who was then president of the National Association. No one occupied that position with more ability or greater courtesy and kindness. As to the question of contracts, one of the objects of their association was to see that fair contracts were insisted upon between builders and their employers. The point which the High Sheriff mentioned had occurred to them as most unfair, and anything they could do to set right that injustice he would be glad to do. As to excessive competition, he did not think the remedy was yet discovered, and the time was distant when builders would see their way to get a fair amount of profit from every contract.

The report for the past half-year was read by the secretary, Mr. J. A. S. Hassall. It ran as follows:—The Blackburn and Shrewsbury Associations, and Messrs. Wheeler Bros., Reading, and H. I. Sanders, Southampton, have resigned their membership, but new members have been found in Cheltenham, Douglas, Isle of Man, and Hereford Associations, and Mr. G. E. Hawes, of Norwich. Your council have pleasure in reporting that the improved condition of trade is steadily continued throughout the country. The Workmen's Compensation Bill brought in by the Government, although primarily intended to principally apply to those engaged in mines and similar employment, affects the building trade to a considerable extent. A special meeting of the council was held at Derby in May last to consider the subject, and a committee—consisting of the president, Messrs. J. S. Jones, S. G. Bird, R. Neill, jun., J. Bowen, and J. Bowden—were appointed to deal with the matter. The joint Parliamentary committee of the Builders' Institute and Central Association of Master Builders of London invited your committee to join them in a joint conference, which was held in London, the outcome of which was that the president of the London Association (Mr. Shepherd), Col. Stanley Bird, and the president of the National Association, were deputed to take such steps as they might think best in the matter. These gentlemen had a long interview with the Home Secretary, when the deputation explained to the right hon. gentleman the objections of the trade to the Bill as it then stood. Sir Matthew White Ridley listened most attentively to, took note of all that was said, and thanked the deputation for their visit, from which he told them that he had gained considerable information, and assured them that the points they had mentioned should receive his very careful consideration. Several amendments were introduced during the committee on the Bill and many more have been put down for the report stage by the Government and private members, but it is at present quite impossible to say what form the Bill will eventually take; at any rate, what is perfectly clear is that the risks of a builder's business will be much increased, and that consequently the question of insurance assumes greater importance. The Plumbers' Registration Bill was presented and read a first time on the 22nd January. On the 30th April it was read a second time and referred to the Standing Committee on Trade, who, on the 13th May, reported the Bill as amended to the House, where it is still under discussion. Your council will continue to give their careful consideration to any legislation affecting the trade. In pursuance of the resolution passed at the meeting held in Edinburgh in July last directing your council to prepare and report a new form of indenture of apprenticeship, with power to obtain the opinion of counsel thereon, they have examined numerous copies of those at

present in use in various parts of the country, supplied them by the local associations, and recommend one, the draft of which was read at the meeting of the association held at Blackburn in January last. It was there resolved that copies of the proposed indenture should be circulated amongst the members of the council for further consideration, and that the matter be adjourned until the next meeting of the executive. The proposed indenture is practically a combination of the salient points of those formerly issued by this association and that of the Lancashire Federation of Builders. An invitation has been received from the National Association of Builders of Belgium to attend a conference in Brussels in August next. Principally through the energy of Mr. Krauss and the Bristol Association, a federation of many of the local associations in the West of England has been started, and bids fair to be a great success. It is hoped that similar organisations will be formed in other districts, where local matters can be discussed with greater advantage than by the National Association, which by its name and constitution is intended to deal with those larger questions affecting the trade as a whole in all parts of the kingdom. The continued increase in the number and importance of trades' unions, no less than their arrogant behaviour, renders it of more importance than ever that masters' organisations should be formed in every town in the kingdom, and affiliated to the National Association, which would have the effect of increasing the power and usefulness of the "National" to a degree commensurate with the importance of the interests and welfare of the trade it was established to consider and protect.

The President, in proposing the adoption of the report, said there had been a large number of demands made during the past half-year, and alterations in consequence. There had been 67 alterations, 60 of which were for alterations in wages. He wished the increase of wages resulted in an increase of work, but he was afraid experience showed that an increase of wages meant decrease of work. Competition would, he feared, long continue, and there should be greater consideration for each other and less desire to get work no matter at what price. He referred to the Workmen's Compensation Bill, and said the employers should not have a double-barrelled pistol presented at their heads, so that a man having proceeded under the Employers' Liability Act, should not be allowed to go on under the Workmen's Compensation. One great objection to the Bill by the building trade was that it did not include the trade as a whole, or leave it out altogether. He advocated local federations being formed in different parts of the country, and spoke of the arrogant nature of the demands made by trade unions, especially in the case of the bricklayers, who refused to allow any but the sons of bricklayers to be apprenticed. The plasterers, too, were very troublesome. He believed they would have to fight once for all as to whether capital should rule labour, or labour rule capital; and an association like theirs would be of the greatest possible service in such a warfare. Mr. Bowen, of Birmingham, seconded the resolution. Mr. W. Shepherd, of London, gave some particulars respecting the Employers' Liability Bill, which he described as the latest phase of Socialistic legislation. If the incidence of the Bill extended over the whole of their industry, instead of being partially extended, it would be better. He wished that meeting could strengthen the hands of the House of Lords, who were endeavouring as far as possible to intercept that latest specimen of immature and ill-considered legislation, and prevent it passing into law; to ask the Lords to postpone their assent to that Bill till the operation of it could be better seen, and its probable effects better calculated. Mr. Krauss made some remarks on the organisation of the West of England Federation. The report was then adopted.

Mr. C. W. Green subsequently presented the treasurer's statement, which was adopted.

The meeting next considered the report of the council on the following:—(a) Proposed form of apprentice indenture to be adopted by this association. (b) A resolution passed by the Central Association of Master Builders of London, respecting the scarcity of plasterers.

On the Workmen's Compensation Bill the council reported that the Bill, as passed, was unsatisfactory, and efforts should be made to amend it in the House of Lords. A resolution

expressing the opinion that the measure would act injuriously in the interests of employers and employes was also passed.

It was fixed that the next half-yearly meeting of the association should be held in London.

ANNUAL DINNER.

In the evening the Bristol Master Builders' Association gave a banquet to the delegates and some others at the Victoria Rooms, Clifton. Mr. A. Krauss (president of the Bristol Association), took the chair.

The President having proposed the loyal toasts, Mr. Frank N. Cowlin submitted "Our Defenders on Land and Sea." Sub.-Lieut. Goodenough Taylor and Col. Stanley George Bird responded.

Alderman Inskip gave the toast "Imperial Parliament," to which Col. Sir Edward S. Hill, M.P., responded.

Mr. J. Howard Colls submitted "The City and Port of Bristol," and Mr. G. H. Perrin responded.

Mr. Arthur Lee, in proposing "The Architects, Engineers, and Surveyors," said they had seen improvements in the houses of the poor, and they now had houses which let for £15 or £20 a year which afforded greater convenience than some of the best homes which were to be obtained in ancient Athens. Mr. J. M. McCurrich, Mr. Frank Wills, and Mr. Henry Williams returned thanks.

The High Sheriff submitted "The National Association of Master Builders of Great Britain," which was acknowledged by Mr. T. F. Rider, President of the National Association.

Mr. A. A. Hudson, Q.C., proposed "The Bristol Master Builders' Association." He said there were two or three things which made success in life. The first was to buy or contract well, the next was to carry the contract out well, and the last thing was to get paid. He considered builders were especially badly used, as when they had to get their money they had the most expensive process known to the law to get it. Another matter he thought was that no builder should sign a contract unless there was an arbitration clause. Mr. A. Krauss, in responding, referred to the formation since the last half-yearly meeting of the Builders' Federations of Lancashire and their own West of England and South Wales, and expressed a hope that the example would soon be followed all over the country. United they stood, divided they fell, as there were questions to be gone into of more importance than that of wages.

Mr. W. Church also responded to the toast. The list was brought to a termination with "Our Guests," proposed by Mr. W. H. Brown.

On Wednesday the delegates took part in a successful excursion to Chepstow and Tintern Abbey, and yesterday (Thursday) they paid a visit to the sister city of Bath, where they were welcomed and entertained by the Local Master Builders' Association.

GRAPHIC STATICS.—XI.

ANY plane rectilinear figure may be regarded as the skeleton diagram of a frame consisting of rigid bars freely hinged together, and may, therefore, be taken to represent a framed structure or truss, in which, whatever stiffness the joints may possess is to be neglected. The young student will, therefore, see the necessity of considering a few of the geometrical properties of plane rectilinear figures, to help him to an understanding of the laws which govern framed structures.

Deformable Figures.—A figure is said to be *deformable* if its *shape* may be altered without altering the length of any side. (The word *side* may here mean any line belonging to the figure.) It is easily seen that any four-sided figure is deformable; for instance, a square may be *deformed* into a rhombus. A deformable figure cannot represent a perfect truss.

Indeformable Figures.—A figure is said to be *indeformable* if its shape cannot be altered without altering the length of at least one side. A figure may be *strictly indeformable*, or it may have *surplus lines*. A figure is said to be *strictly indeformable* if it contain only the exact number of sides necessary to determine its shape. Such a figure becomes deformable if any one line be omitted.

A four-sided figure becomes *strictly indeformable* if one diagonal be added; and it has one *surplus line* if both diagonals be added.

A little care is necessary here to avoid mis-

understanding. It must not be supposed that the shape of a strictly indeformable figure is necessarily determinable when only the lengths of its lines are given, since more than one such figure can often be constructed with lines of the same given lengths. This is shown in Figs. 41 and 42, where the five sides CA, AB, BC, CD, DA are of the same lengths respectively in both figures. But each of these figures is strictly indeformable, since neither figure can, without breakage, be changed from the shape originally given to it as long as no line alters its length. It is in this sense that the shape of a strictly indeformable figure is said to be perfectly determined by the lengths of its sides. This will need to be borne in mind as we proceed.

A word may here be profitably said as to the manner in which the lines and vertices of figures are to be counted. In many cases, if the figure be not lettered, the counting of the vertices or of the lines of the figure may be done in different ways. For instance, in Fig. 41, suppose the diagonal BD to be drawn, and the figure to be unlettered, then it would be uncertain, from the figure alone, whether we were intended to count the point of intersection of the diagonals as an additional point. If the point of intersection be counted, we must consider that point as representing a joint, and each part of each diagonal must be counted as a separate line. The figure will then become one with five vertices and eight sides, and will be a particular case of Fig. 43.

We now pass on to discuss the means by which we may distinguish between the different classes of figures, and here a new definition of a strictly indeformable figure may be helpful. A figure is strictly indeformable when the fixing of any two of its points will fix every point in the figure. The position of any point P with respect to any two fixed points A, B, in the same plane with P may be determined in many ways. For example, the position of P may be fixed: (1) By the length of AP, Fig. 44 (a) and the angle which AP makes with AB; (2) By the length of AP, Fig. 44 (a), and the length of BP. The first of these methods is not suitable for our purpose, since to fix the angle BAP, Fig. 44 (a), would necessitate a rigid joint at A, and the rigidity of joints does not enter into our calculations. The second method is entirely suitable, since the point P, Fig. 44 (a), is kept immovably fixed, as long as the lengths AP, BP do not alter. If, however, we were asked to find the position of P, having given only the points A and B, and the distances AP, BP, we should not be able with certainty to do it, because, Fig. 44 (a), the points P and P', both fulfil the same two conditions, and either of these points might be taken.

We see, then, that two points in a figure being fixed, every remaining point in the figure requires two conditions to fix it, and that, for our purpose, these two conditions must be its distances from two points previously fixed.

In any figure consider any one side, AB, and the two vertices, A, B, which it joins; then the position of every succeeding vertex in the figure will be determined by the lengths of two additional lines. Thus, in a strictly indeformable figure of s sides and v vertices, the number of sides $(s-1)$ exclusive of any one side must be twice the number of the remaining $(v-2)$ vertices. That is,

$$s-1 = 2(v-2),$$

and therefore—

$$s = 2v - 3.$$

Every strictly indeformable figure fulfils this condition; but, as we shall presently see, it does not necessarily follow that every figure which fulfils this condition is strictly indeformable.

If the figure have n surplus lines, it follows that $s = 2v - 3 + n$. If n' lines be required to make the figure strictly indeformable—

$$s = 2v - 3 - n'.$$

The condition that $s = 2v - 3$ is necessary in order that a figure may be strictly indeformable; but it is not always sufficient, since some figures which fulfil this condition have a deficiency of lines in one part and a redundancy in another part. The additional condition that no part of the figure must contain a surplus line is necessary. Observe, then, that a strictly indeformable figure may show a deficiency of lines in some parts, but never a redundancy. But even this does not make the test quite complete, as will now be shown.

In Fig. 44 we have two triangles, ABC, DEF, the sides of the one triangle being equal and parallel to those of the other respectively.

Hence the lines AD, BE, CF, which join the corresponding vertices, will be equal and parallel (Euclid, I. 33); and, this being the case, it is easily seen that the fixing of any line of the figure will not fix the figure. Suppose the side AC fixed, this will fix the triangle ABC, but will allow the points D, E, F to move through arcs

having ABC as their respective centres, and the same sides which form a parallelogram in any one position will form a parallelogram in any other position of the figure. So also if one of the parallel lines AD, BE, CF be fixed, the other points may move through arcs having the two fixed points as centres.

Now, Fig. 44 has nine sides and six vertices, and $9 = 2 \times 6 - 3$ —that is, the figure conforms to the condition $s = 2v - 3$; also no part of the figure

contains a surplus line. If the line AD be removed, and BD or BE be drawn, the resulting figure will be strictly indeformable. And it is worthy of notice that the fixing of any two diagonally opposite points, as A and E of Fig. 44, would fix the entire figure.

Much more might be said on this part of the subject, but it has already extended beyond the space it was originally intended to occupy.

The following question is taken from the "Honours" examination in Machine Construction and Drawing, Department of Science and Art, 1888: A crane is constructed—as shown in Fig. 45 (a). Draw the reciprocal stress diagram for determining the stresses on the jib, stays, and

crane post, and the thrusts on platform and foot-step bearing.

We shall take the load as being suspended from the junction of jib and stay. If the chain is supposed to pass over a pulley, and the direction of the other part of the chain is known, the pull of that other part must be taken into account, as was done in Fig. 11 (c). (See No. 2178, p. 480.)

With respect to the supporting forces, it should be carefully noted that, as a rule, they are altogether indeterminate, both in direction and magnitude, unless special arrangements are made as to the nature of the supports. In the present case the directions of these have been given, and we are thus able to find their magnitudes. In this example the direct forces exerted by the members can be easily found without finding the supporting resistances, as there are only two members meeting at the point of application of the load.

Thus, make ab , Fig. 45 (b), represent the load to any scale. Then the polygon of forces for the point A BEA is the triangle $abea$; the polygon for the point EBFE is the triangle $ebfe$; the polygon for the point FBGF is the triangle $fbgfg$; the polygon for the point A EFGDA is $aefgda$; so all the internal forces are found. The resistances BC, CD may now be found by drawing bc parallel to BC, and so completing the polygon $dgbcd$ for the point DGBCD. On the principle on which the other points have been named, the right-hand end of the platform would be called the point ADA, and the polygon for that point is the double straight line ada . All the internal forces and the supporting resistances have now been found; those members which are in compression are denoted by thick lines in Fig. 45 (a).

If more than two members met at the point of application of the load, it would be necessary to determine the other external forces before the internal forces could be found, and this may be easily done in a variety of ways, if we regard the truss as simply a rigid body kept in equilibrium under the action of the given and required external forces.

(1) Since there is equilibrium, the resultant of the load and the force DA must be equal and opposite to the resultant of BC and CD; and since each resultant acts through the intersection of its components, these resultants must each act along the dotted line joining these intersections in Fig. 45 (a).

Draw, then, the dotted line bd in Fig. 45 (b) parallel to that in Fig. 45 (a), so finding the point d ; draw bc parallel to BC, and cd parallel to CD, so completing the polygon $abcda$ of the external forces acting on the frame. It will, of course, be seen that db represents the resultant of DA and AB, and that bd represents that of BC and CD.

(2) By the principle of moments, since the body is in equilibrium under the action of the external forces, the algebraical sum of their moments round any point must vanish—that is, the sum of the moments in one direction is equal to the sum of those in the opposite direction. Take moments about L the intersection of BC and CD. Then the moments of these two forces must each vanish, because the point about which the moments are taken is on the line of action of each force. Hence there remain only the moments of DA and AB to deal with. Therefore—

Moment of DA = moment of AB;
that is— $DA \times LN = AB \times MN$;
therefore— $LN : MN :: AB : DA$.

Thus the construction is join LM Fig. 45 (a); draw bd , Fig. 45 (b), parallel to LM; then from the similar triangles LNM, bda —

$$LN : NM :: ab : da.$$

Therefore da gives the value of the force DA, and bc , cd , parallel respectively to BC, CD, give the value of these other forces.

It is thus seen that the construction in (2) is the same as that obtained in (1); but for purposes of arithmetical calculation the principle of moments is very convenient and highly valuable. Thus, since—

$$\begin{aligned} DA \times LN &= AB \times MN, \\ \text{we must have— } DA &= AB \times \frac{MN}{LN}, \\ &= AB \times \frac{8' 6''}{8' 3''}, \\ &= AB \times \frac{102''}{99''}, \\ &= AB \times \frac{34}{33}. \end{aligned}$$

(3) The funicular polygon may be used with

great advantage when there are several given forces to deal with. In the present case there is no saving of labour by its use; but perhaps the principles will be the better understood from the fewness of the lines. We have to bear in mind that, since there is equilibrium, the force polygon and the funicular polygon must both close.

In Fig. 46 (a), the lines of action of the external forces are shown; the numbering indicates the order in which the forces will be taken in the force polygon. It is evident that each pair of parallel forces will also be equal, since the force polygon becomes a parallelogram when the forces are taken in a certain order.

In Fig. 46 (b), ab represents the force 1; therefore we know that ba will represent the force 4. Take any pole, o ; join oa , ob ; draw anywhere, Fig. 46 (a), the line 1, 4 parallel to oa to terminate on lines 1 and 4; draw 4, 3 parallel to ob ; draw 1, 2 parallel to ob ; join 3, 2; this is the closing-line of the funicular polygon. Draw oc parallel to 3, 2, to meet bc drawn parallel to the forces 2 and 3; then $abcba$ is the polygon of the forces 1, 2, 3, 4; and thus the required thrusts are determined.

The reader is reminded that the side of the funicular polygon which terminates on the lines of action of two forces is parallel to the vector from the pole to the intersection of the corresponding forces in the force polygon, and that in Fig. 46 (b) two of the vectors coincide, since b is the point of intersection of the forces 1 and 2, and of the forces 2 and 3.

Another method of working out the unknown external forces is shown in Figs. 47 (a), 47 (b). Here the forces are taken in their original order.

In Fig. 47 (b) draw ab to represent the load; take any point o , and draw the vectors oa , ob . In Fig. 47 (a) starting from 1, the point of intersection of BC , CD , draw 1, 2 parallel to bo , to meet AB at 2; draw 2, 3 parallel to oa to meet DA at 3; join 1, 3; then 1, 3 is the closing-line of the funicular polygon of the forces A , B , C , D , A ; draw od in Fig. 47 (b) parallel to 1, 3, to meet ad parallel to AD . Then da represents the force DA , and bc , cd , parallel respectively to BC , CD , will complete the polygon of the external forces. The special feature of this construction is that one of the unknown sides of the funicular polygon (that which would be parallel to oe) is got rid of by using the point of intersection of the two forces, BC , CD , as a corner of the funicular polygon; this enabled us to find the direction of the fourth side, 1, 3, and so to get the direction of the vector od , and, therefore, also the point d . It is often of great advantage for one side of a funicular polygon to be thus made to vanish.

J. C. PALMER.

NOTES FROM PARIS.

SOME uneasiness is being felt in certain quarters over the question of the proposed metropolitan railway for Paris, the work for which, it appears, will be carried out by the Compagnie Générale de Traction, with which company the municipal council is entering into contract. It is stated that out of 125,000 shares, subscribed by 58 persons, 7,750 are in the hands of English business men, whilst the acting directors are Belgians. If this is true, the undertaking will be largely in English hands, and the uneasiness shown by the Frenchman, who considers that such an affair should be strictly French, is easily understood.

A new and very interesting museum has just been installed by M. Jules Guiffrey at the Manufacture Nationale des Gobelins, and is destined to contain the best examples of retrospective and modern styles of tapestry in France since 1700. The new museum is arranged in the Chapelle des Gobelins, a building presumed to have been built by one of the Gabriels. There are examples of old tapestry work signed by Coppel, de Berain, Van der Meulen, Boucher, and other celebrated old masters, and to these are added a large number of water-colours reproducing the tapestries of all the schools from the 15th century, and the sketches of contemporary artists whose designs may be required by the national manufactory of tapestry. This museum is of high interest, and should be visited by all designers of tapestry; it will also form an additional field of study for the artisans and apprentices of the manufactory.

The picturesque corners and old smaller buildings of Paris are gradually disappearing; but, fortunately, the best and most interesting

examples of old work are jealously guarded by those who make it a duty of doing their utmost to preserve such work. The interesting Hôtel d'Anglade, in the Rue des Archives, has just been sold to the highest bidder and is to be demolished, its position not allowing any means of preserving it. This mansion was built in 1667, under Louis XIV. for François de Juge, and is in all probability the work of the famous Mansart, or, some say, of his brother-in-law, Robert de Cotte, the official architect of Louis XIV. The sculpture decoration of the exterior and interior is the work of Coysevox and his pupils, and the three large painted ceiling panels are the work of Charles de Lafosse, pupil of the great Le Brun, the architect-painter, who designed the Apollo gallery at the Louvre, and whose pupil, Lafosse, was intrusted by Mansart with the decoration of the Invalides. This mansion was classed for some time as an historical monument, but had to be abandoned; it is hoped, however, that all work which may escape the hands of the demolishing contractor will be preserved for one of the museums.

The Minister of Commerce has announced that the future salons will be installed in the immense hall of the Galerie des Machines, in the Champ de Mars. The wide gallery of the first floor will be divided up by partitions, and will afford ample accommodation for the paintings and drawings of the two rival salons; the sculpture gardens will be arranged on the ground floor.

The following architects have now been definitely commissioned with the various portions of the work for the coming Exposition of 1900, and the list may not be uninteresting to those who intend sharing in the important display of exhibits which Great Britain proposes to make:—M. Girault is the chief architect of the two fine palaces now being erected in the Champs Elysées, MM. Deglane, Louvet, and Thomas being charged with various portions of the work; M. Binet has the monumental entrances on the Place de la Concorde and the Champs Elysées; MM. Cassien Bernard and Cousin have the designing of the decorative portion of this fine new bridge, Alexandre III., and the arrangement of the quays of the Seine above the Invalides; MM. Toudoire and Pradelle have the palaces of education and the buildings for the exhibits of national manufacture; Esquié, that to contain the exhibits of work for the decoration of private and public buildings; Gauthier, the palace of horticulture and the quays over the Alma bridge; Mewes, the buildings of social economy and congress; Tronchet and Rey, the pavilions of navigation, forests, hunting, and fishing, and the quays below the Alma bridge; Sortais, the palace of letters, science, and art; Varcollier, that of alimentary; and Blavette, those for textile arts and industries; Hermant, the palace of civil engineering and means of transport; Paulin, that of machines, mines, and metallurgy, and the Chateau d'Eau, in the Champ de Mars; Henard, the palace of electricity and that of chemical industries; Raulin, the arrangement of the Galerie des Machines as a Salle de Fêtes; Deperthes, the palace of the colonies; Troppey-Bailly, the pavilions of ceramic, crystal, and glass industries; Bonnier, is chief of the section of installations; and Masson Detourbet, the arrangement of the foreign sections.

One of the immense steel caissons for the abutments of the new bridge Alexandre III. is completed. These two caissons will be the largest and heaviest constructed up to this time, each one weighs 3,800 tons, with dimensions 154ft. by 125ft. All the powers have now promised their official adherence to the Exposition of 1900, excepting Brazil, Paraguay, Siam, and Venezuela. The United States Government has voted a sum of 500,000dol., an amount which should permit the States to be very completely represented at this Exposition.

A new room is being arranged in the Louvre Museum for containing the plaster casts to be taken from the ancient chefs-d'œuvre, the originals of which are scattered in the principal foreign museums. This new room, situated between the principal entrance to the Louvre and the Porte Jean Goujon, was once used as a riding school by the Prince Imperial. The vaulting is supported by a number of columns with capitals sculptured by Fremiet, representing hunting attributes; the decoration of the room, which was once very magnificent, has unfortunately been allowed to deteriorate, but will be restored in some portions.

The Arc de Triomphe of the Place de l'Etoile

is still encumbered with the massive scaffolding necessary for the work of restoration; the first credit voted for this work was £5,000; but a larger sum will probably be required to execute the complete restoration of the monument and the chefs-d'œuvre of the sculptors Rude, Etex, Lemaire, and Chaponnière.

The recent disastrous fire of the Rue Jean Goujon has once more opened the eyes of the authorities to the necessity of prescribing rigorous measures and regulations for the security of the public in places of entertainment, and a number of theatres and music-halls have been temporarily closed for the necessary work. A sum of £7,000 has been voted by the Government for this work at the Grand Opera House. As the cost of a new iron curtain to the stage would be over £4,000 it has been decided to retain the existing one, and further protect it by a curtain of asbestos. This economy will permit the work in the various portions of the theatre to be executed in a very complete and thorough manner.

The works sent in by the students of painting, sculpture, and architecture at Rome, are now being exhibited at the Ecole des Beaux-Arts, and form an especially interesting show this year. M. Lefevre has a marble group entitled "Niobe," a really remarkable piece of work; the principal figure, personifying maternal grief, is very striking in its effect and execution. "The Tireur d'Épine" and "L'Amour du Guet," by M. Roux, are very prettily and excellently treated; the "Pelerin de la Vie," and a graceful statue sent in by M. Roussel, and the clever medallion relief, "Souvenir Français," by M. Coudray, complete the works of this year. The large hall of the first floor is devoted to the exhibits of painting and architecture; the strange and fanciful picture of M. Laverne, "Edipus," has great success, and "The Past Illusion," by the same artist, is characteristic of the bold qualities of the work of this young painter. "The Christ and the Adulterous Woman," by M. Descheneaud, is a picture remarkably well-lighted, and the "Samson and Delila," of M. Leroux, is rich in colour, the principal figures being exceedingly well-lighted and modelled. The picture by M. Larée, "The Body of St. Vincent Protected by Ravens," is clever, with its sombre twilight effect. In architecture, M. Pille has an interesting and carefully-measured drawing of a pretty Composite capital found at the Palatine Mount, the large-size details of which, drawn in red chalk, show the graceful curves of the acanthus leaves and the ram's horns. M. Recoura sends a large and well-drawn and coloured study of the funeral monument raised in the Church of Santa Maria in Ara Coeli, Rome, to the memory of Cardinal Lebreton (1465). M. Patouillard has a conscientiously washed drawing, giving the restoration of the entablature of the Temple of Peace at Rome. M. Chaussemiche gives the actual state and the restoration of the column of Mars the Avenger at Rome, and a few sketches, the most interesting being that of a Roman house of the 16th century, the façade of which is ornamented with very clever sgraffito work, which has been excellently indicated in the drawing. M. Eustache has measured the important excavations of the house of the Vestal Virgin in the Via Sacra, of great interest and archaeological value, and M. Bertone sends the complete measured drawings and restoration of a temple of Ba'al Schamin at Palmyra, with large-scale details, drawn in red chalk with great exactness, giving the curious style of the sculpture and decorative work of this small temple.

The works of the students of painting who have competed for the Prix de Rome, are on exhibition at the Ecole des Beaux-Arts. The subject for competition was, "Vulcan, aided by Force and Violence, enchains Prometheus on the summit of the Caucasus." This subject, drawn from the tragedy of Æschylus, necessitated treating with much boldness, and the symbolical figures of Force and Violence should take a very important part in the composition of the picture. The candidates, however, appear to have lost sight of this, and to have misunderstood the real advantages which such a subject allowed for interpretation; the larger proportion of the ten paintings are, therefore, wanting in character and vigour, although several contain excellent qualities of grouping and execution. Amongst the best of these are the painting of M. Wielhorski, who shows us a Prometheus, with vigorously contracted muscles; a Vulcan, whose pose is natural, with excellently modelled

figures of Force and Violence aiding him to bind Prometheus; that of M. Isaac Boisson, full of good qualities of colour and impressionist in style; those of M.M. Galand and Charbonneau, both well painted, and that of M. Louis Roger, which is certainly the best of these. The two principal figures, of Prometheus and Vulcan, are shown in brilliant lighting and striking relief, and the strength and action of the two bodies are almost vigorously expressed.

A credit of £1,000 has been allowed for transforming the covered gallery surrounding the magnificent assembly hall of the Trocadero into a closed-in vestibule, and the architect, M. Bourdais, has been requested to submit a scheme for greatly enlarging the palace in view of the coming Exposition; it is proposed to add two important pavilions for salles de fêtes and exhibitions at the ends of the curved wings of the building; this would greatly change the aspect of the Trocadero and encroach largely on the gardens; but, on the other hand, the additions are necessary, and would not form an unpleasing feature in the ensemble.

The construction of six lines of railway through Paris has been voted by the municipal council, and it is hoped that Paris will at last have its much-wanted metropolitan railway. The lines will be of narrow gauge and electricity employed as motive power. The town of Paris is authorised to borrow 165,000,000*fr.* for this work, which is to be intrusted to the Compagnie Générale de Traction. It is proposed to fix the fares at an equal sum for a portion only or the whole of distance available—a system which would work very well at Paris.

"GOOD TENANTABLE REPAIR."

WHAT constitutes "good tenantable repair" is a question of every-day importance in the preparation and signing of agreements and leases. The fault is often with a tenant himself, who signs an agreement to keep in repair a house that is dilapidated, and render it up in a better state. The reports of cases of this description give very little information for the guidance of lessees and tenants. A very ordinary clause in an agreement is that during the said term, say of three years, the tenant "agrees to keep the said premises in good tenantable repair, and so leave the same at the expiration thereof." But the question of "commissive" and "permissive" waste comes in—in other words, the tenant's liability depends on whether he has allowed the premises to fall into a dilapidated state from want of proper care and attention. As, for instance, the tenant may neglect to paint or do some little repair, and by his neglect further damage is caused to the building, and he must make good the further damage also. Many people who sign agreements with this covenant have an idea that the phrase "good tenantable repair" is intended only to refer to such trifling repairs as paper-hanging and painting, whitewashing, &c., and that they are not liable for any structural or substantial repair. But in many cases a person may find himself mistaken if he takes this view of his obligation. A man who has bound himself to keep the premises in "tenantable repair" may be called upon to do a great deal more than he expected—for instance, he may be called upon to make good damage to a roof or a chimney that was damaged by a storm. A high wind, for instance, may dislodge slates and cause damage to the ceiling below by rain coming through; or the wind may tear up a lead-flashing or a flat, exposing the roof to serious damage. The tenant would be answerable for such injury by neglecting to make timely repairs. Yet it is very difficult to say under some circumstances what may be reasonably interpreted as tenantable repair. We may imagine the leadwork worn out, or the brickwork, through age and decayed joints, incapable of securing the lead, or the timber, through age, decayed so much as to render the slates insecure—a condition of things that would alter materially the question, and make it unreasonable to call upon the tenant to repair and make good what is worn out by age. The age and class of premises ought to be considered. One definition of tenantable repair appears to be reasonable, and may be considered as decisive. It was given by the late Baron Alderson, in "*Delcher v. Mackintosh*." He said, "It is difficult to suggest any material difference between the term 'habitable repair' and the more

common expression, 'tenantable repair'; they both import such a state as to repair that the premises might be used and dwelt in not only with safety, but with reasonable comfort by the class of persons by whom, and for the sort of purposes for which, they were to be occupied." Applying this ruling to old premises which have become dilapidated, it is quite clear that the tenant is not expected to give the landlord new buildings at the expiration of his term, but that he should deliver them up fit to be occupied for the purposes they were used for. Lord Esher, in a judgment on appeal ("*Proudfoot v. Hart*"), decided in this sense. He considered it was not sufficient for the tenant to deliver up the premises in the same condition of repair as he took them, but in good repair, even if they were not in good repair when the tenancy began. Lord Esher also quoted Lord Justice Lopes' definition, with which he entirely agreed. "'Good tenantable repair' is such repair as, having regard to the age, character, and locality of the house, would make it reasonably fit for the occupation of a reasonably-minded tenant of the class who would be likely to take it." On these grounds it is considered that when the premises are not in repair when a tenant enters, and he undertakes to keep them in repair, he must put them into repair before he leaves, in order to discharge his obligation to keep and deliver them up in repair. We can apply this principle to such repairs as papering, painting, and decorating, which are the kinds of repair generally looked for by incoming tenants. It does not mean to assert that a tenant must repaper with a similar paper to that which was on the walls when he took the house, and repaint it with similar paint to that which was painted. Certainly not; but the tenant is still required to repaper and paint occasionally to keep the house in tenantable condition. If the paper or the paint is merely in a worse condition than when the tenant entered, he is certainly not compelled to repaper or repaint so long as a reasonable-minded person would regard it as in a fair state of repair. But if it has been torn off in places or become peeled off by damp, the tenant may reasonably be called upon to repaper, not with paper of the same value or of a richer pattern, but of a kind which would satisfy any reasonable man. So with painting. If it has been worn or washed off to such a degree as to expose the wood to decay or to look shabby, the tenant can be reasonably expected to repaint; and it ought to be in the same manner or style, if possible, that would suit the locality and the class of tenant. As to ornamental work, say a gilded or painted ceiling which has become worn and looks shabby, the tenant can hardly be expected to put it in the same condition so long as it is decent. As to more structural matters, like a rotten floor or leaky roof, a tenant who takes a house in such a state is to blame for not seeing it put in a proper state before he takes it. But if he takes it in such a condition, his obligation to keep in tenantable repair is binding upon him. So that if the roof is leaky he must make it watertight, and if a floor is too rotten he must put a new one down. And these demands are reasonable, though tenants regard them as arbitrary and exacting.

COUNTY COUNCIL WORKS DEPARTMENT.

THE Works Committee of the London County Council, having been inferentially abolished by the resolution passed by Council on June 28, the General Purposes Committee have prepared a series of regulations for the administration of the department under the new conditions. These rules define the manner in which work to be carried out without the intervention of a contractor must be undertaken. Unless otherwise ordered, they are to be carried out by the manager of the Works Department, who shall be responsible to the Executive Committee in the same way as a contractor would be. The Finance Committee is to have control of the finances of the department. It is also proposed that any Committee contemplating the execution of any work shall, before coming to a decision, obtain an estimate from the proper officer. When the estimate is received, if the Committee should then decide to recommend the Council to have the work carried out without the intervention of a contractor, they shall, before reporting to the Council, refer the estimate, together with full plans and specifications, to the manager of the Works Department

for his examination and report. Most of the recommendations deal with minor details of administration, with the management of the staff, and with the finances of the department. Under this latter head it is proposed that the accounts shall be kept by a works accountant, who will be responsible to the Finance Committee of the Council. The position of the manager of the Works Department is defined in the following clause:—The head of the Works Department is to be styled "manager of works," and is to be responsible, unless in any case it is otherwise ordered, for the execution of all works executed on behalf of the Council without the intervention of a contractor; he is also to be responsible under the Finance Committee for advising as to the purchase of plant and material, the employment and supervision of all officers and workmen in his department or employed on works, and the care, regulation, and direction of all workshops and depots connected with the Works Department, including the central works; and is also to be responsible to the Finance Committee for the custody, issue, and use of all plant, materials, and stores purchased in connection with works executed; and, in addition to the other conditions on which he holds his appointment, he is to give his whole time to the duties of his office, and is not to take any private business; and any fees received by him, either as a witness or in any other capacity, and any discount or allowance on materials purchased are to be paid to the Council; and, further, on retirement he shall not be entitled and shall not make any claim to any retiring allowance under the Superannuations Act, 1866, and he shall be subject to the Council's regulations in respect of a superannuation and provident fund.

CONSTRUCTION OF ARCHES IN CONCRETE.—IX.

THERE are still two examples of the compound system of concrete construction remaining on our list to be inquired into, and their powers of resistance investigated. They are respectively the Metropolitan and the Expanded Metal Systems. A cross-section of one bay of the first type is represented in Fig. 1, and may be thus described. In the concrete or matrix, as it might be termed, are embedded a number of wire strands *b-b* from 2in. to 3in. apart, which are of sufficient length to extend in one stretch over some half-dozen of the rolled beams *a-a*. A camber of about 6in. is given to the wire strands by causing them to pass underneath an iron rod *d*, varying in diameter from $\frac{1}{2}$ in. to $\frac{3}{4}$ in., which is also buried in the matrix. In this particular example, the mixture or concrete, which is in a semi-fluid state, sets or hardens very rapidly, so much so that the temporary centres can be struck an hour after the filling in is completed. While the necessity of employing false centring, which has been shown not to be required in the Roebling System, is a slight disadvantage, they can be shifted so quickly as scarcely to cause any extra delay in executing work. Instead of sawdust, wood shavings as well as other mixtures, are employed, and also in a type of concrete flooring very similar to that shown in Fig. 1, and the iron rod is replaced by ordinary lengths of gas-piping. A modified form is also in use, which retains the wires in the flooring, but strengthens the ceiling with flat iron bars, resting on the lower flanges of the rolled beams, and also imbedded in the matrix. Where appearance is an object, as it is in all cases where a ceiling is brought in evidence, the great objection to the wire system is that the inevitable corrosion of the metal, if unprotected in any way, discolours the plastering. This drawback, which, however, does not exist for engineering structures of the character already described, may be almost entirely nullified by the employment of galvanised iron wires, or by any one of the many processes and devices by which that material is protected from rust and decay. Another objection is of considerably more importance, and by no means so easily remedied, although, fortunately, it belongs only to one particular method of construction—viz., that in which sawdust is used. This substance not only absorbs a very large proportion of water, but retains it for a great length of time. It, in fact, will not dry for a long time thoroughly, and the only manner (in instances in which rapid drying is essential) by which the evil can be effectually overcome is the employment of another material, of which there is a fair amount to select from.

Smith gave an address as to the excavations which had been made by the students of the school, and the proceedings terminated with a vote of thanks to the president for presiding.

IRON ROOF OVER THE MACHINE HALL OF THE GENEVA EXPOSITION.

IN a recent issue of the *Bulletin de la Société Vaudoise des Ingénieurs et des Architectes*, M. J. Gaudard discusses the novel structure erected by Messrs. Th. Bell and Co., of Lucerne, and designed by their engineer, Mr. C. Doucas, where the pure cantilever principle is applied to roofs. The cantilevers rest on columns 124ft. 8in. apart and 47ft. 6in. high; they are anchored down to standards 35ft. 6in. high at the side walls, which are 288ft. 8½in. apart. At the centre, between the free ends of the cantilevers, is a space of 25ft. 3in. spanned by a ventilator roof. The standards, being designed to resist the whole of the wind-pressure, have a base of 5ft. 7in., and are anchored on to blocks of concrete. The length of the building, 490ft. 6in., is divided into nine intermediate bays of 47ft. 7in. and two end bays of 31ft. 2in. The cantilever principals inclosing the end bays meet in an expansion-joint in the centre, the ventilator only extending over the inner nine bays. In this part there are 10 latticed purlins. The intermediate rafters supported by the purlins are 15ft. 10in. apart and 3ft. 3in. deep, and carry intermediate H-bar purlins. There is no wind-bracing except in the two end bays.

The main bracing in the principals, purlins, and intermediate rafters is arranged in single triangulation, and generally consists either of two angle bars riveted together or of single angle-bars, the length of these members varying from 4ft. to 10ft. Columns and standards are also made of single triangulation lattice-work. The lightness of the structure is remarkable.

Before carrying out the design, the committee of the Exhibition submitted it to the criticism of Professor Ritter, of Zurich, who approved of it, and recommended the following factors for the calculation of strength:—Snow load, 6-14lb. per superficial foot; wind-pressure, 16-38lb. per superficial foot; tension or compression on wrought iron, seven tons per square inch. The total weight of wrought iron is about 500 tons—i.e., 7-78lb. per superficial foot, or 0-135lb. per cubic foot inclosed. The iron structure, after having served its purpose, became the property of the contractors.

THE MARCHIONESS OF LORNE AS AN ARCHITECT.

PRINCESS LOUISE, Marchioness of Lorne, who opened Mr. Passmore Edwards' new convalescent home at Cranbrook on Tuesday, is familiar to the public as an amateur painter, and as one who can handle the sculptor's chisel. Her Royal Highness has now turned her attention to the more practical art of architecture, and workmen are at present engaged in completing a building designed by the Marchioness (with the assistance of a young London architect), and erected on the Argyll ducal estate in Scotland. The plans designed by her Royal Highness were for the extension of the little hostelry at Roseneath, a sylvan shaded resort most charmingly situated on the western bank of one of the long blue lochs that open off the Firth of Clyde. Roseneath is one of the most secluded retreats on the Clyde. On this account the Marchioness and the Marquess of Lorne have for some years past found in Roseneath a delightfully quiet recruiting ground at the close of the London season, and the little inn has been their home. The enlargement designed by the Marchioness is being carried out to provide a wing for the distinguished couple when they visit the district. The wing will include some half-a-dozen bedrooms, public rooms, a spacious hall and offices; and the plans have been drawn up with an architectural success so great that the work may in coming years be looked back upon as the pioneer design in the opening up of a new field for the ever-widening work of womankind. The drawing-room is a handsome apartment, and its large windows face the picturesque waters of the Gareloch and Ben Lomond; while a spy window has been inserted—no doubt for the purpose of commanding a pretty peep of the western sunsets and the Argyll hills. There is also an alcoved fireplace with arched stone mantelpiece. In the

dining-room the windows have mediæval arches and iron mullions, with casements and small panes. A gun-room is also provided, and, as becometh a lady architect, the kitchen is a culinary poem in red tiles. Internally perfect in design, externally the building is straggling and far from pretty. It has many quaint features, however, in the form of knobbed rhones, spouts instead of rain-conductors, and basket windows. The design is royal and also unique, and the inn when finished will be by no means a conventional one. So close is the interest taken in the work connected with the rearranged hostelry by her Royal Highness, that she intends herself to paint the device on the sign that is to hang in old-time fashion over the doorway of the public entrance to the building; and the walls of the new apartments are to be artistically decorated according to the Marchioness's own scheme of treatment.

MODERN OPERA HOUSES AND THEATRES.

MR. EDWIN O. SACHS has sent us the second volume of his great work, published for him by Mr. B. T. Batsford, under the above title. Neither trouble nor expense have been spared to make the book as complete and thorough as possible, and, moreover, the drawings are uniformly delineated in firm, well-defined outline, at once practical and technical, showing the buildings chosen for illustration in a complete and useful way. The undertaking surpasses anything of the kind ever attempted in this country before, and the editor certainly has got together a collection of theatres and kindred buildings which is quite unique. When the first volume appeared some time since we spoke favourably of Mr. Sachs's venture, upon which he has in no way slackened his endeavour to make his book worthy of the occasion; indeed, as a financial success it must be exceedingly doubtful, so lavish has been the editor's outlay. Of this the subscribers and readers of this great folio have the distinct advantage. To the architect engaged on theatre or entertainment-hall buildings such a book must be of the utmost value, for there are in this volume alone 100 plates and 95 illustrations in the text. Among the English theatres illustrated in the present book are "The Lyric" and "Her Majesty's" in the Haymarket, "The Garrick," "The Empire," and "The Oxford" Variety Theatre, all in London; the Shakespeare Memorial Theatre, Stratford-on-Avon; "The Grand" Theatre, Leeds; and the "New" Theatre, Cambridge. The National Opera House Paris, and the "National" Opera Comique, and the "Eden" Variety Theatre are further representatives from Paris. Other theatres are included from Italy, Spain, Austria, Hungary, Germany, Greece, Roumania, Holland, and Switzerland. All of these are represented by plans, several are shown in sections, and elevations of all are given. The amount of labour and correspondence in collecting so much information must be patent to everyone. The editor has not merely contented himself with this task of compilation, but he enters in detail into the schemes which his types represent. To take an example, "The Lyric" Theatre, Milan, which was opened about three years ago. No architect was employed, but a "master builder" (one Achille Sfondrini), a specialist, who travels from town to town erecting theatres and other places of amusement. "He is certainly quite an extraordinary character, and one cannot but be struck on the one hand by his remarkable ability in directing his men and managing his work, and on the other by his ignorance of the most elementary principles of design and the necessities of modern theatre construction." "To erect a playhouse of this size under considerable difficulties, without any of the facilities of draughtsmanship, and without even the knowledge afforded by ordinary school education or elementary technical instruction is no mean achievement in the annals of this age of progress." The theatre thus alluded to is one of the best of its class, and the façades are executed in plaster in a style quite above the average for work of this description. The Paris Opera House and the Court Opera House, Vienna, take the lead in Continental theatre building, and these are followed closely by the Municipal Theatre at Palermo and the Hofburg Theatre, the most architecturally meritorious of them all in the opinion of the editor. Although small, none for picturesqueness surpassed Mr. Unsworth's theatre at Stratford-on-Avon.

To institute a comparison, however, between such diverse buildings as those gathered together in Mr. Sachs's monumental volume, would prove a task beyond our limitations of space, and little practical utility would result from such a brief inquiry in so restricted a notice as this, wherein the pleasurable duty of informing the reader in general terms of what he can obtain from the book itself has mainly to be kept in view. The plans alone, without sections, would be scarcely understandable where levels change at almost every few inches, and where in no instance does the same plane extend over the whole area. On limited sites, with often other requirements to consider apart from the sole business of a theatre, the complication of planning is often most intricate and ingenious. Awkward sites not infrequently result in extremely clever arrangements, especially in the contrivance of the entrance lobbies and staircases to various parts of the house. Herein nearly always, of course, consists one of the chief essential merits, or otherwise, of a theatre plan. To obtain an unobstructed view of the stage from all parts of the house, too, presents a problem which is met in a variety of ways, with, of course, varying degrees of success, as a reference to Mr. Sachs's comprehensive volume will show.

THE ENGINEERS' DIRECTORY.

MESSRS. KELLY AND CO. (Kelly's Directories, Ltd.), of 182, High Holborn, W.C., have just issued the eighth edition of their indispensable "Engineers' and Iron and Metal Trades Directory," a work which, during the past 27 years, has been the standard work of reference for all concerned. It is gratifying to note that the depression which afflicted these great industries at the time of the issue of the last edition has passed away. Last year was indeed a record one, as far as the production and working of pig-iron and steel were concerned. The total make of pig-iron in 1896 was 8,563,209 tons, while the output of British steel reached nearly four million tons. As the trades represented grow, so this bulky but admirably arranged Directory increases, and it is hardly possible to eulogise too highly the painstaking care which is exercised by its compilers to secure comprehensiveness and accuracy.

CHIPS.

The trustees of the Edinburgh Orphan Hospital have adopted plans by Mr. Allan Carter, C.E., for improving the lavatory and sanitary arrangements at the hospital at an estimated cost of £1,500.

Mr. W. O. E. Meade-King, M.I.C.E., has held a Local Government Board inquiry at Knaresborough with reference to an application by the rural district council for sanction to a loan of £3,550 for sewage and sewage-disposal works for the township of Bilton.

The will of Mr. George Thomas Robinson, F.S.A., the well-known authority on plaster work and decoration, of 20, Earl's-terrace, Kensington, who died on May 6th, was proved on July 2 by Mrs. Frances Robinson, the widow and sole executrix, the value of the personal estate being £10,500 4s. 11d. The testator leaves everything he died possessed of to his wife absolutely.

A stained-glass memorial window has been placed in the parish church of Moffat, N.B. The window, which is one of two lights, has been filled with an illustration of the text, "Be thou faithful unto death, and I will give thee a crown of life." The window has been executed by Messrs. Ballantine and Gardiner, Edinburgh.

A new Wesleyan chapel is being built in Marlborough-road, St. Alban's, at a cost of about £4,000. The building will be of red bricks with stone dressings, and the style will be Gothic, a tower being placed between the chapel and the adjoining schoolroom.

The memorial to be erected at Freemantle Church, near Southampton, as a Diamond Jubilee celebration, namely, new oak choir stalls, to replace the present communion rails with brass, and to renovate the flooring in the chancel, is now well in hand. The cost of the work will be £350.

The enlargement of St. George's parish church, Gravesend, is now in progress at an estimated cost of £2,000. A new north aisle is being provided and the galleries, except that at the west end, are being done away with, but the new arrangement will provide 680 seats on the ground floor instead of 400 as formerly. The removal of the organ to a small gallery in the south-east corner of the church, over the Joyces' memorial window, is also contemplated.

Building Intelligence.

CRANBROOK.—The Passmore Edwards Convalescent Home at Cranbrook, near Staplehurst, was opened on Tuesday afternoon by Princess Louise, Marchioness of Lorne. The home, which is provided in connection with the Metropolitan Hospital, Kingsland-road, N.E., and which was illustrated in our pages on October 16, 1896, stands on Starvenden Farm, Cranbrook, the site having been presented by Mr. F. S. W. Cornwallis, formerly M.P. for Maidstone. To enable the hospital committee to avail themselves of a legacy of £10,500 left by the late Mr. Henry Spicer, who stipulated that the interest only was to be used, and that for Samaritan purposes, Mr. Passmore Edwards, immediately on being appealed to, gave £3,000 wherewith to build the home, which will accommodate six male, six female, and six child patients, and has been so designed as to allow of future extension. The ground floor contains lobby, hall, dining-room, day room, rooms for the matron and nurses, baths, and the usual domestic offices. On the upper floor, over the principal entrance, is the matron's and nurses' bedrooms, with inspection windows looking into the men's and women's wards respectively. There is also a private bath-room for the matron and nurse. The children's dormitory is over the dining-hall, with a nurses' bedroom adjoining. The back stairs lead to a mending and ironing room and servants' bedrooms. At the end there is a male attendant's bedroom, reached by a private stair over the outer offices. The building is faced with hard local red bricks. The walls of the upper floor are covered with hanging tiles, and the roofs with red roofing tiles. The exterior is homely and simple in design, greater attention being given to internal comfort rather than to external effect. The site is sheltered from the North and N.W. by the rising land at the back and the wood at the side. The builders were Messrs. Jas. Wood and Son, Boughton Monchelsea, near Maidstone, Kent. Mr. Charles Grieve was the architect. Mr. Passmore Edwards has promised to erect a cottage hospital for Cranbrook, provided the ground is given.

HARROGATE.—The new Royal Baths will be opened by the Duke of Cambridge to-day (Friday). They have been built at a cost of about £100,000, from plans by Messrs. Baggallay and Bristowe, of London, selected in open competition. The buildings face Montpelier-road, are Renaissance in style, and are fronted with stone. The central dome rises to the height of 100ft. The institute consists of a central pump-room, a water-garden 220ft. by 42ft. covered in with glass, suites of baths and dressing-rooms, accommodating 140 bathers at once, special and sulphur baths, Turkish baths, and rooms for massage, inhalation of vapour, &c. In connection with the central hall are cooling, reading, and refreshment rooms, and the manager's rooms. The basement contains accommodation for attendants, laundry, bathing machinery, pumps, boilers and pipe subways. The whole of the bath-room floors are laid with marble tiles, and the floor of the large dressing-room is laid with polished oak parquet.

HOLLOWAY ROAD, N.—On Thursday afternoon in last week the Lord Mayor formally opened the Great Hall of the Northern Polytechnic Institute in the Holloway-road. This institute was founded under a scheme of the City Parochial Charities Act, and towards the cost of construction the Clothworkers' Company subscribed £17,500, whilst other City guilds made grants amounting to £2,500. We illustrated the architect's design as selected in competition in our issue of August 24, 1894. The educational buildings at present erected consist of two blocks—one with a frontage on the Holloway-road, and the other roughly parallel with it some 200ft. away. These two blocks are connected by a corridor, on the north side of which is the great hall; while on the south side is a plot of ground, covering nearly twice the area of the hall, on which are afterwards to be erected the remaining buildings of the institute. Each of the main blocks consists of three floors. In front the ground-floor is taken up by the entrance hall, the principal's room, and the secretary's offices. Above are the drawing office, the engineering department, and the physical lecture theatre and laboratory. The second block contains the brickwork shop, the smithy, the carpenters' shop, and the mechanical and chemical laboratories. On the ground-floor, beside the hall,

are the gymnasium and a common room. The great hall is approached from the Holloway-road by means of a vestibule. It measures some 100ft. by 55ft., will seat over 1,200 persons, and is fitted with an orchestral platform. The roof is elliptical shaped, and is covered with fibrous plaster divided into panels with ornamental centres, every alternate panel containing an electric light. In the daytime the hall is lighted by circular-headed windows supported by stone columns, each bay containing three windows inclosed in a setting of moulded bricks, whilst the floor is of solid cubes, and has a gradual slope from the entrance to the front of the platform. The gallery has a separate entrance from the Holloway-road, and an emergency exit to the rear. In the front there are three doorways, with three on the north side as exits, leading into a corridor connecting the body of the hall with the orchestra platform. Beneath the platform is a retiring-room, with other rooms for artists, speakers, &c., whilst laboratories are also provided close by. The heating is by steam, conveyed in pipes along channels each side of the hall. The ventilation is so arranged that fresh air enters the steam-heated channels from the outside, passes warmed into the building, and is drawn away through the ceiling openings to exhaust ventilators on the roof of the hall, whilst an additional supply of fresh air is also obtained by openings the full width of the side windows, forming a sill made of iron. The architect was Mr. Charles Bell, F.R.I.B.A., 3, Salters' Hall-court, Cannon-street, and the work has been carried out by Messrs. Macfarlane Brothers, of Holloway.

HYDE.—The foundation-stone of the new Technical School and Free Library was laid last week in Union-street. The style is a free treatment of English Renaissance. The building is divided in two sections, a public free library in the one, and a science, art, and technical school in the other. The public library is central, so as to provide supervision of the adjacent rooms. The lending department is both top and side lighted, and will provide accommodation for 14,000 volumes. A public reading room with bays and recessed fireplace is also provided, together with news room, librarian's office, general store room for periodicals and newspapers, cataloguing and repairing room, a separate room for specifications of patents, as well as lavatory accommodation and conveniences for the staff. The technical school portion of the structure comprises on the basement floor provision for the teaching of cookery, dressmaking, laundry work, and art modelling, store room for cycles, together with cloak and lavatory accommodation, and space for heating-boilers, coal, coke, &c. On the ground floor classrooms are obtained for the teaching of commercial subjects, committee room, secretary's room, together with lavatory and other accommodation. The building is approached by two main entrances from this floor, with a vestibule to each, one facing Union-street and one a new street, communicating with corridors by wide fire-proof staircases to every floor. On the first floor are elementary art room, advanced art room, art master's own room, elementary drawing room, physical laboratory, chemical laboratory for forty students, together with sulph. hydro. room, balance and re-agent rooms, combustion room, master's room, and a large lecture theatre provided with a raised gallery to seat 100 students; also preparation room, store-room, lavatories, &c. The chemical laboratory, as well as the lecture theatre, will each have open timbered roofs, and are lighted by mullioned and transomed windows. The art rooms are principally north lighted, with windows as free as possible from divisional bars. The building throughout will be warmed with hot water on the low pressure system, the vitiated air being extracted by means of trunks in the ceiling, connected with exhaust ventilators on the roofs and in the main turret. All exposed internal joinery is to be executed in selected pitch-pine, slightly stained and varnished, the floors of corridors, passages, &c., being wood blocks laid on concrete, while the entrance halls will be paved with ceramic mosaic of simple design. The principal elevations will be faced with machine-made red Ruabon bricks, having all dressings and enriched work carried out in Doulton's Rowley Regis biscuit-coloured terracotta, the enriched panels, borough arms over principal entrance, doorway, &c., being modelled from cartoons supplied by the architects, and executed under their personal supervision. The roofs are to be covered with Westmorland sea-green slates.

The contractors are Messrs. S. Robinson and Son, of Hyde, and the work will be carried out from the designs and under the supervision of Messrs. Woodhouse and Willoughby, F.R.I.B.A., of Manchester and Stockport; the clerk of works is Mr. Samuel Mellor. The structure will take about fifteen months to complete, at a total cost of about £12,000, including equipment.

LEITH.—At the Dean of Guild Court on Monday Messrs. Pattisons (Limited) were granted a warrant to erect a warehouse nine stories in height at Bonnington. Messrs. Pattisons have recently acquired the old sugar refinery at Bonnington for the purpose of extending their storage accommodation. The old buildings are being partly demolished, and partly converted into bonded stores. In addition to the existing buildings, the firm are erecting a new bonded warehouse, which, it is asserted, will be the largest in the kingdom. The new building stands on the banks of the Water of Leith, and has a railway siding running into it from the Leith branch of the North British Railway. The new building is 190ft. long the one way by 180ft. the other, and is nine stories high. The height from the foundations is close upon 100ft. The floorage area is 6½ acres. It is entirely built of brick, and there will be about one million and a half of bricks used in its construction. The interior, having to bear great weights, is entirely constructed with steel standards and steel beams, the old cast-iron construction of bonded warehouses being abandoned. By this means greater strength and greater economy are secured. There are upwards of two miles of steel standards in the new warehouse, and five and a half miles of steel beams. The building will accommodate over 22,000 casks of whisky. There are three mechanical lifts in the new building for taking in and discharging the casks, and these can be raised direct from the carts and from the railway trucks without intermediate handling. The lowest floor, which is to be used as a duty-paid and bottling department, will be entirely fire-proof. The architects for the new building are Messrs. George Beattie and Son, 136, George-street, Edinburgh.

RHOSROBIN.—St. Peter's Church, Rhosrobin, in the parish of Rhosddu, Wrexham, the contract for which is just let, is to be built on the west side of the road leading from Wrexham to Bradley Mills. It consists of a single-span nave, 50ft. by 25ft., with chancel, 25ft. by 17ft. 6in., vestry, vestry porch, surmounted by a small octagonal bell-turret, and south porch to nave, and is designed to seat 224. It is to be built of bricks from the neighbouring brickworks, with terracotta dressings also made by the same firm, open-timbered and boarded roof, slated with Bangor slates; all the interior woodwork, including the seating, is of pine. The contract has been let to Messrs. Rogers and Son, of Brymbo, at £845, the building committee finding the bricks, terracotta tiles, sand, and carting of these; and the work is being executed from the designs and under the superintendence of Mr. J. H. Swainson, architect and surveyor, Wrexham, whose plans were selected in a recent limited competition.

The watching and lighting committee of Aberdeen Town Council approved on Friday of amended plans for the erection of a central fire-brigade station in King-street. The estimated cost is £12,200.

We learn that the Carpenters' Company have appointed Mr. H. Phillips Fletcher, F.S.I., A.R.I.B.A., as their surveyor, in the place of Professor T. Roger Smith, who had held the appointment for many years, and who has now joined the Court of the Company.

Another permanent addition to the seaside attractions of Great Yarmouth was made on Monday by the opening of a revolving observation tower erected on the North Beach near the Royal Aquarium. The structure is 125ft. in height, and is built entirely of steel on concrete foundations. Including the machinery, it weighs about 125 tons. A circular platform built round the tower, and constructed to accommodate about 160 passengers, is raised to the summit, and lowered by means of steam-power. As it ascends, the platform revolves by means of electric power at the rate of one revolution in three minutes. There is another platform at the summit, to which access is obtained from the revolving apparatus, and which is hoisted to an additional height of about 20ft. At night the structure is illuminated by 50 incandescent electric lights and by three arc lights. At the base of the tower are bars and dining-rooms. The cost of the structure has been £6,000.

LEGAL INTELLIGENCE.

DISPUTE AS TO ROAD REPAIRS.—THE MAYOR AND CORPORATION OF LEEDS v. LORD HAWKE.—In this action, tried at Leeds last year, judgment was reserved and was delivered by Mr. Justice Vaughan Williams on Friday. It was an action brought by the Corporation of Leeds, the plaintiffs, against the defendant, as trustee of the estate of John Miles Dawson, to recover the expenses of paving a certain street in Leeds. The action turned on the interpretation of the Leeds Improvement Act, 1842 (5 and 6 Vict., c. 104), sections 135 and 136, and on section 50 of the Leeds Improvement Act, 1869. Mr. Dawson was the owner of houses abutting on a street called Club-terrace, Leeds. In May, 1891, the plaintiffs gave him notice to pave the street, and on his neglect to comply with the notice the plaintiffs did the work themselves. Mr. Dawson refused to pay the expenses, and proceedings were threatened against him in May, 1892. Mr. Dawson died in 1896, and the proceedings were now taken against his trustee. The principal question in the case was whether the street in question was a highway that had been repaired by the district in which it was situated. On behalf of the plaintiffs it was contended that the onus of proving that the road was repaired by the district lay on the owner. On behalf of the defendant it was contended that the onus lay on the plaintiffs. Mr. Justice Vaughan Williams gave judgment for the plaintiffs. He said he was of opinion that the affirmative onus imposed by section 50 of the Act of 1869 was thrown on the plaintiffs as the road authority; but he came to the conclusion, in fact, that there was some evidence in support of the negative which the statute had so inconveniently thrown upon the road authority. His Lordship doubted whether the framers of the Act intended to throw the onus on the road authority; but he seemed, nevertheless, to have done so. But, taking the whole of the evidence, and considering the state of the road at and after March 20, 1886, it had been proved that the road had not, prior to that date, been repaired by the surveyor.

INTERPRETATION OF THE PRIVATE STREETS WORKS ACT.—HESTON AND ISLEWORTH URBAN DISTRICT COUNCIL v. GROUT.—This was an appeal from a decision of Mr. Justice North, and was recently heard by Lords Justices Lindley, Lopes, and Rigby. On October 30, 1891, the Heston and Isleworth Local Board, the predecessors of the plaintiff authority, served notices, under section 150 of the Public Health Act, 1875, on the frontagers of Prince Regent-road, Hounslow, to sewer and make up the road, in accordance with deposited plans and sections, within three months. The frontagers not having done the work within the prescribed time, the local authority became entitled to do the work themselves, and charge the frontagers with the expenses in proportion to their frontage, but it was not until November 12, 1894, that the authority, who were then the district council, obtained the necessary sanction. The work was completed in October, 1895. A sum of £157 14s. 10d. was apportioned as the share of the defendant in respect of frontage to property in the road owned by him. In the meantime—namely, on June 12, 1894—the local authority had passed a resolution adopting the Private Streets Works Act, 1892. The defendant refused to pay on the ground that the effect of the adoption of the Private Streets Works Act, 1892, was to render abortive the notice given by the authority to sewer and make-up the road. The plaintiffs accordingly took out this summons for a declaration that the apportioned sum was a charge on the defendant's premises and to have the charge realised. The Private Streets Works Act contains new provisions as to the making of the streets, and gives a power to apportion expenses by less rigid rules than those of the Act of 1875, and it also gives the frontagers different rights of contesting their liability from those previously in force. Section 24 provides that the powers given by the Act are in addition to other powers, and section 25 provides that sections 150, 151, and 152 of the Public Health Act, 1875 (the sections under which the local authority were acting), shall not apply to any district in which the Act of 1892 is in force. It was contended, on the part of the plaintiffs, that section 38 of the Interpretation Act, 1889, kept alive the right of the district authority to proceed under their notice, notwithstanding their adoption of the Act of 1892. Mr. Justice North adopted the view of the Act contended for by the plaintiffs, and gave judgment for them accordingly. The defendant appealed. The Court dismissed the appeal. Lord Justice Lindley was of opinion that the learned Judge had arrived at a right conclusion. When the notice under the Act of 1875 was given, it was a perfectly valid notice; and it was in force for nearly three years before the Private Streets Works Act was applied to the plaintiffs' district. It would be a forced construction of sections 24 and 25 of the Act of 1892 to say that everything done under the notice given under the Act of 1875 would have to be done over again. Even if there were any doubt as to the true effect of those sections, that doubt was removed by section 38 of the Interpretation

Act, 1889. The true effect of these enactments was merely that, after the Act of 1892, no fresh notice could be given under the Act of 1875. The appeal failed. Lord Justices Lopes and Rigby concurred.

SURVEYOR'S ACTION TO RECOVER COMMISSION.—In the Queen's Bench Division, an action was recently heard by Mr. Justice Wills, in which Mr. A. Church, an architect and surveyor, sought to recover £600 commission from the Hotel Providence Company, Ltd., in respect of the sale of the Hotel Providence, Leicester-square. Defendants denied liability. It seems that in July last the Hotel Providence was for sale, and the plaintiff was communicated with, and the company forwarded him a commission note to the effect that, in the event of his selling the house for £50,000, he should receive a commission of £1,000. Eventually, plaintiff saw Mr. Morley, of the firm of Morley and Letts, auctioneers and valuers, of Earl's Court, who told him he was prepared to find a customer if he would share the commission with him. To this the plaintiff agreed, and Mr. Morley introduced a Mr. Kirk, who purchased the house for £42,000. The suggestion made by the defendants was that Mr. Vaughan, one of the directors, really introduced Mr. Kirk; that he had put forward the plaintiff as a kind of nominee to obtain the commission which he, as a director, could not get himself; and that he would eventually share the commission. Evidence was heard, among the witnesses called being Mr. Morley, who said that Mr. Kirk told him he could make an offer of £42,000 for the hotel, and that the offer was afterwards made. It was submitted for defendants that what the plaintiff and Mr. Morley did had no influence in inducing Mr. Kirk to buy the house. Mr. Justice Wills said he thought plaintiff had done quite enough to entitle him to his commission, and judgment for £600, and costs, was given accordingly.

WHAT IS A "PRIVATE DRAIN"?—SEAL v. MERTHYR TYDVIL, & CO., DISTRICT COUNCIL.—In the Queen's Bench Division, Mr. Justice Cave and Mr. Justice Ridley have given judgment in this case, stated by magistrates raising a question as to the meaning of a "private drain" in section 19 of the Public Health Act, 1890 (53 and 54 Vic., c. 59). The section in question is as follows:—"19 (1) Where two or more houses belonging to different owners are connected with a public sewer by a single private drain, an application may be made under section 41 of the Public Health Act, 1875." "(3) For the purpose of this section the expression 'drain' includes a drain used for the drainage of more than one building." The 41st section referred to authorises the local authority to charge the expenses of abating a nuisance on the owner of the premises. The case was stated by two justices for Glamorgan upon the complaint against Mr. T. F. Seal, that he, being the owner of certain premises, Nos. 23, 30 to 36, and 38, Cromwell-street, Merthyr Tydvil, upon which a nuisance existed, had not abated the nuisance. The nuisance alleged was that a certain drain was in a defective condition. The proceedings were taken under section 41 of the Public Health Act, 1875, as extended by section 19 of the Public Health Act, 1890. Within the Merthyr Tydvil Urban District a number of houses have been erected by the Tydvil's Well Building Club, of which the appellant is the secretary and receiver of the rents, upon both sides of a new street called Cromwell-street. A drain was made running at the back of the houses through the gardens. This drain joined the sewer of the district council. A connection from each house with the drain at the back was made by a branch drain. The drain commenced at the back of No. 40 and extended at the back of the houses to the sewer, and it could not be used by other houses. The district council have adopted the Act of 1890. The respondents contended that the drain running at the back of the houses 21 to 40 was a private drain under the definition in section 19 (3) of the Public Health Act, 1890, and that, it being out of order, the appellant must abate the nuisance. The appellant contended that the drain was a drain into which two or more houses belonging to different owners were drained, and that, therefore, it came within the definition of a sewer contained in section 4 of the Public Health Act, 1875. The magistrates found that the drain was a drain used by two or more houses belonging to different owners, and that it was a drain for the particular houses Nos. 21 to 40, and for no other premises. They decided that the respondents had a right to proceed under section 41 of the Act of 1875. They therefore made an order on the appellant to abate the nuisance. Mr. Macmorran said the question was, What was the meaning of private drain in the Public Health Act, 1890, section 19? By section 2 of that Act the other Public Health Acts were incorporated. By section 11 (3) the meaning of "drain and sewer" given in the Public Health Act of 1875 were made applicable. He cited the following cases, and pointed out that the decisions had not been uniform:—"Travis v. Uttley" (1894), "Self v. Hove Commissioners" (1895), "Hill v. Hare" (1895), "Brad-

ford v. Mayor of Eastbourne" (1896). This was a case which told against him, but he contended that it was inconsistent with "Hill v. Hare," and not, therefore, binding on the Court. He also cited "R. v. Mayor of Hastings" (1897). The Court upheld the decision of the magistrates, and dismissed the appeal, without calling on the counsel for the other side. Mr. Justice Cave said, by the Public Health Acts, 1848 and 1875, all sewers were vested in the local authority, and sewers were defined as drains draining more than one house. This was found to create some difficulty, for when one man built two houses on his own land and drained them, the drain became vested in the local authority and had to be paid for by them. That was one difficulty, but it was got over by holding that the Act did not apply to houses in the same curtilage, and that the drain, until it came out of the private property into public property, could not be said to be a sewer. Then there came another difficulty. When houses belonging to different owners drained into a sewer, whereby they connected with the public sewers, in that case it was hard that the public should have to pay for what was in fact a private drain. The 19th section of the Act of 1890 was, therefore, passed. By that section, when two or more houses belonging to different owners are connected with a public sewer by a single private drain, certain consequences followed. The definition of "private drain" included a drain used for the drainage of more than one building. What, then, was a "private drain"? In the opinion of the learned Judge the term applied to a drain constructed in private grounds to which the public had no access. The intention was that the public were to be relieved from paying for that which they were not allowed to use. In this case it was found that there was no power to drain other houses into this drain. The rational view of a private drain was that this was one. It was said that this view was not in accordance with "Hill v. Hare." If, however, in that case the drain was, properly speaking, a private drain that case was wrongly decided, and, at any rate, it only determined the status of the particular drain in question. The magistrates were quite right in their decision, as they found, in fact, that the drain was only for certain houses, and not one into which any other could drain. Mr. Justice Ridley concurred.

LIGHT AND AIR CASE.—TUCKER AND OTHERS v. TAUNTON MANUFACTURING COMPANY.—This case was heard before Mr. Justice Day without a jury at the Bristol Assizes. Dr. Hodges, Q.C., and Mr. Duke (instructed by Mr. Poole, Taunton) were for the plaintiffs, and Sir Walter Phillimore, Q.C., and Mr. Foote (instructed by Mr. Shearman, of London) were for the defendants. The case arose in consequence of the erection by the defendants of a stock room immediately opposite, and 7ft. 6in. away from the windows of classrooms used in connection with the school belonging to the plaintiffs. The plaintiffs contended that this erection rendered the rooms absolutely unsuitable for classrooms, and claimed that the height of the building should be reduced. Mr. Basil Cottam, of Bridgwater, was called on behalf of the plaintiffs, and he produced various plans and sections and a model showing the position of the plaintiffs' and defendants' properties, both before and after the erection of the stock-room. The other professional witnesses were Mr. William Eve, of Union-court, Old Broad-street, E.C., and Mr. Williams, of Bristol. The defendants called Mr. H. H. Collins, of Old Broad-street, London, and Mr. W. Gibbs Bartlett, of New Broad-street, E.C., both of whom contended that in considering the matter the angle should be taken from the centre of the window, which was 6ft. 9in. from the floor, the height of the room being less than 10ft., and that such line should be taken to the eaves, disregarding the roof, which was hipped. The Judge viewed the property, and the hearing of the case occupied the whole of one day and part of two others. The Judge complied with the request of the plaintiffs, and granted a mandatory injunction ordering the defendants to pull down the building to the line laid down by Mr. Eve, and gave the plaintiffs their costs.

DREDGING GRAVEL FROM THE LOWER THAMES.—In the Appeal Court on Monday, before the Master of the Rolls and Lords Justices A. L. Smith and Chitty, the case of the Conservators of the Thames v. Smeed, Dean, and Co. came on for hearing. This was an appeal by the Conservators of the River Thames from the decision of Mr. Justice Bruce refusing to grant an injunction against the defendants, a well-known firm of brickmakers, to restrain them from continuing to dredge or raise gravel, sand, and ballast from a part of the lower river known as Haddleigh Ray, without having first obtained a license from the Conservators to do so, on the ground that the spot in question was part of the "bed" of the river within the meaning of the word "bed" as used in section 87 of the Thames Conservancy Act, 1894. The Conservancy contended that the question was one of very great importance. It was a part of their duty to keep the river navigable, and they would be hindered in the exercise of their duty if the riparian owners

of the Lower Thames were at liberty to dredge as they thought fit. The contention of the respondents was that they were not raising gravel from the bed of the river at all, the barges having taken the sand from a part of the river which was foreshore. Lord Justice Smith, in the course of his considered judgment, said in his opinion the Conservators' power to require a license being first obtained from them was cut down to those cases where the removal of sand might, if carried too far, interfere with the navigation, and also that the board was not entitled to make a profit out of the sand so raised. The appeal, therefore, would be allowed, and a declaration granted that the place in question was part of the bed of the river, and that the respondents were not entitled to take gravel and the like from the bed of the river at Hadleigh Ray without a license from the board. After some discussion leave to appeal was given.

LIABILITY OF AN ARCHITECT ON HIS ESTIMATES.—W. J. ROGERS AND CO., LIMITED, v. WATKINS.—This case was heard before Mr. Justice Day at the Bristol Assizes on Monday. Mr. Bullen and Mr. Beverley Vachell were for plaintiffs, and Mr. Foote, with Mr. F. E. Weatherly, was for defendant. Counsel for plaintiffs informed his lordship, who took the case without the aid of a jury, that Messrs. W. J. Rogers and Co. Limited, were brewers at Bristol, with a branch at Newport, Monmouthshire. Defendant was an architect practising at the latter place, and plaintiffs sought to recover from him in respect of negligence in advising as to the cost of a building to be erected on the Power Estate, Newport. Defendant advised that the cost would be between £600 and £700, whereas in the end plaintiffs had to pay £1,163 17s., and the action was brought to recover the difference. There was a counter-claim by defendant for £56 for commission on the work executed. Plaintiffs were anxious to extend their business at Newport, and a large building estate known as the Power estate, being developed, they decided to acquire premises thereon. It was in respect of the cost of the house so erected that the action was brought. Mr. Charles Henry Reed, builder, of Newport, said he agreed to build a house at schedule prices for plaintiffs, the defendant being the architect. As the premises now stood he would not give more than £500, and the outside rent was £29, the landlord paying all the taxes. The rents of the houses on the estate generally ran from 5s. 6d. to 8s. 6d. a week. Mr. Garland, plaintiffs' manager, said he would not have consented to the erection of the house had he known that the estimate was to be materially increased. For instance, he was not prepared to expend £900. He was dumbfounded at the bill. Mr. Foote contended that, the schedule prices having been agreed to by plaintiffs, there was nothing for them to do but to pay for the work executed. Mr. Bullen relied on the explicit understanding between the parties that the price was not to exceed £700. The defendant Watkins said he made a mistake in his rough estimate of 5d. per cubic foot, which amounted to £674; it should have been 7d. per foot, which would have worked out to £900. By Mr. Bullen: He discovered the first mistake of £200 before the work was actually in hand. He could not admit that he again made a mistake to the extent of a similar amount; but the second increase of £200 was due to "extras." Did you ever inform plaintiffs of extras? Mr. Garland knew. By the Judge: Did you let Garland know before the contract was signed that your estimate was utterly wrong? In effect, my lord. His Lordship: In effect! Why not clearly and in detail? It certainly was important. Re-examined: The only contract was to erect a house according to schedule prices. Mr. Henry Williams, architect, of Bristol, said the estimate by the cube was a rough one, and not to be relied upon. If the house obtained a license, it would be worth double what it cost. Mr. Foote having addressed the learned judge, Mr. Bullen replied on behalf of plaintiffs. His lordship said he was not satisfied that defendant had apprised plaintiffs of the increased expenditure, and that was negligence. The only question, therefore, was one of damages. The verdict was, therefore, for plaintiffs, damages £150. Mr. Foote said that they were entitled to something under the counterclaim for defendant's commission. Mr. Bullen objected, on the ground that defendant's service was valueless. His lordship awarded £35 to defendant, giving a verdict for plaintiffs at £115 and costs.

"NO SUCH UNSATISFACTORY MEN AS ARCHITECTS."—In the Nisi Prius Court, Nottingham, on Tuesday, before Mr. Justice Cave, the case of Charlotte Jalland v. Charles Tyler and Enoch Hind was tried. This was an action for damages brought by Mrs. Jalland, newsagent and stationer, of Bridlesmith-gate, Nottingham, against Charles Tyler, pork dealer, also of Bridlesmith-gate, and Enoch Hind, builder, for improperly removing certain old buildings adjoining her premises, and for improperly conducting the operations. She also claimed damages for an obstruction to her ancient lights, and for an injunction to restrain the obstruction. Mr. W. H. Stevenson (instructed by Mr. Barlow) appeared for the plaintiff, and Mr. W.

Graham and Mr. Hugo Young (instructed by Messrs. Wells and Hind) represented the defendants. At the outset Mr. Young applied that the jury should be allowed to visit the premises, but his lordship did not think that it was necessary for them to do so. In the absence of Mr. H. Y. Stanger, Q.C., who was instructed along with him, Mr. Stevenson opened the case. He said that Mrs. Jalland had carried on business for a great many years in Bridlesmith-gate, and for the last 14 years she had been the owner of the freehold, which she purchased for £700 or £800. The defendant Tyler was in a large way of business close to. Some years ago he rebuilt his shop, and becoming the owner of the premises adjoining those of the plaintiff in 1896, he decided to pull them down and erect new buildings. The property was some of the oldest in Nottingham, having come into existence 200 years ago or more, and from one point of view one regretted that such ancient landmarks of Nottingham were disappearing. Still, Mr. Tyler was quite entitled to erect new premises, provided he took care not to injure those of the plaintiff or deprive them of the support they were entitled to, and which they had enjoyed since they were erected. Anyone who had premises which had received support from those adjoining for a number of years could claim that those buildings should not be pulled down, or the land excavated to the injury of theirs. Tyler employed Mr. Enoch Hind to pull down his buildings and erect new ones, and there might be a question as to liability of the defendants. Supposing a man employed a builder, and he was negligent, the employer was not liable, but if all care was taken in executing dangerous work, such as the removal of ancient buildings, and the removal of old foundations, he was equally liable with the builder. Both the defendants in that case were men of substance and means, and he did not suppose any question would arise as to their respective liability. After the removal of Tyler's property Mrs. Jalland was startled one morning in May, 1896, by hearing her house crack as if it had been shaken by an earthquake, and a pane of glass broke and fell out. Next day the same thing occurred, and she consulted Mr. Sidney Stevenson, architect. He visited the premises, and he soon found that it was evident that the defendants were practically ruining the plaintiff's building. She carried on a considerable business, her turnover being about £100 a week, and she resided in the upper portion of the place; but by his advice she went to live elsewhere. The cellar arch on which the building depended was so damaged that sooner or later it would collapse. There had been a giving way, some portions of the floor had sunk, none of the shutters would fit, the windows could not be opened or shut, there were large cracks in the walls and roof, and the building was unsafe. It could not be repaired, and it would have to be pulled down and rebuilt. The cost of doing that would be £630, and the jury must not lose sight of the fact that since May, 1896, the plaintiff had had to take other premises to live in. She had also had to pay a woman to look after her premises, and £40 or £50 would be adequate for that. Whilst the repairs or rebuilding operations were going on she would have to take other premises and pay rent, she would have to remove her stock, and it was inevitable that her business would suffer. Mr. Gilbert, builder, had made an estimate of the cost of carrying out the repairs, and he put the sum at £300. He (Mr. Stevenson) submitted that if the defendant's building operations had injured the plaintiff's premises, which had a right of support, without there being any question of negligence they were liable for damages. Mrs. Jalland gave evidence confirming counsel's statement, and in cross-examination she said she did not notice that a heavy waggon was passing when the window-pane dropped out. Mr. S. Stevenson, surveyor and architect, said that the defects in the premises now could not be repaired, and they were unsafe. It had been shored up on three sides, and there was a house on the other, but it might collapse on its own site. Mr. G. S. Doughty, architect, said that the cellar-arch could not be repaired, except at danger to life, and the building would never be really safe. Mr. Herbert Walker, architect, and Mr. H. C. Gilbert, builder, also gave evidence, the latter stating that assuming that the work of repair could be done, it would cost £307. This was the plaintiff's case, and Mr. Graham then addressed the jury on behalf of the defendants. He said that it was admitted that where a house had enjoyed the support of another for twenty years it was entitled to have that support continued; but where they had a rickety old house of that sort nobody could be asked to keep it in position as if it were new and strongly built. His clients were not responsible for the infirmity of the house itself, but they were responsible for the damage they caused. Mr. Tyler rebuilt his premises, and Mr. Stevenson seemed to have had the bright idea that it was a good opportunity to make him rebuild the plaintiff's shop as well. He (Mr. Graham) submitted that the damage had been grossly exaggerated. The shop was very lightly built, it had only 11ft. frontage, including the thickness of the wall, and it was only 20ft.

or 30ft. deep. It now stood between two perfectly solid well-built houses. It had a rock foundation, and it was absolute nonsense to say that the arch which supported it could not be made good. The arch had got out of shape, but there was nothing to show how much of that was due to their operations. The jury were asked to say that nothing could be done except to pull down the house and rebuild it. He had no doubt that that was the best thing to be done, and any prudent owner would have carried out the work before. Anyone could see what a trumpety place it was, and for years it had been allowed to go without repair. Why the plaintiff should turn out during the night time and carry on business there during the day at the risk of her life he could not tell. The case for the plaintiff was that she wanted £600 for a new house, and his case was that every possible care was taken in pulling Tyler's property down. The removal of support must have been extremely trifling. Underpinning was resorted to, and three sides were shored up as strongly as possible. No one could demolish erections adjoining old property without doing some damage, but the plaintiff's house was really far better supported now than it was before. The witnesses for the defendants would tell them that there was no danger whatever, and in order to make it as safe as it was before, a trifling expenditure of about £30 was necessary. What he suggested as the measure of damages was the difference in the value of the house now and what its worth would have been had his clients not done any damage to it. Anyone buying the house would not attribute any value to the bricks and mortar. It was a grossly exaggerated claim, got up with the object of getting a cheap job for Mr. Stevenson and getting a new house built at the expense of Mr. Tyler, who had done everything he could to avoid damage. The old house was practically worn out, and it was impossible to avoid doing some damage to it, but it could easily be placed in the same condition as it was before at trifling cost. Mr. Arthur E. Heazell, architect and surveyor, said that, in his opinion, the house was safe to live in. Mr. W. A. Heazell, architect and surveyor, said that the repairs would cost £41 15s. Thomas Slater, manager to Mr. Enoch Hind, said that he had charge of the pulling down and rebuilding of 45 and 47, Bridlesmith-gate. Witness, who had had 25 years' experience, employed a staff of skilled men. His instructions were to avoid any possible damage, and he did his best. Mrs. Jalland complained since about a pane of glass falling out, and he sent a man down to see to the matter. Arthur Richard Calvert, architect and surveyor, said that his estimate for doing everything necessary would be £40 8s. That would make the house as good for an old house as ever it was. It was perfectly safe since the new building was put up. By Mr. Stevenson: He did not think it was safe before. Alfred V. Bromley, surveyor, also gave evidence. W. D. Pratt, architect and surveyor, and H. Gill, architect and surveyor, gave evidence expressive of the opinion that no real danger had been incurred to the plaintiff's house by the building operations of the defendants.—Mr. Graham then addressed the jury on behalf of the defendants, and Mr. Stevenson followed on the other side.—The learned Judge, in summing up, said that this was one of those unfortunate cases in which they had to listen to what architects came and told them. There were no such unsatisfactory men as architects, for they were always at the opposite poles to one another. All other scientific men tried to come to some sort of an agreement; but architects, on the other hand, tried to contradict each other entirely. That might be due to three causes, and three causes only. Which of these causes was the correct one was not for him to say. It might be that architecture had no science whatever about it. Secondly, there might be science in architecture, but the witnesses who had been called knew nothing about it. Thirdly, there might be science in architecture, and these men might possess that science, but not have the honesty to tell them truly what it was. One or other of these things must be true, or the architects would not be found differing so widely as they always did, and as they had done that day. In point of fact they helped the jury very little indeed, and they had, so far as they could, to come to a decision with as little regard to the architects as possible. The jury were absent half an hour, at the expiration of which time they returned into court with a verdict for the plaintiff, the award being £175.

The Right Hon. G. H. Reid, Premier of New South Wales, visited Port Sunlight, near Birkenhead, on Wednesday, and performed the ceremony of opening a new bridge erected by Messrs. Lever Brothers (Limited). The new bridge, consisting of one arch of 100ft. span, has been designated the Victoria Bridge, and it has been erected across a tidal arm of what is known as Bromborough Pool, the object being to connect one portion of Port Sunlight village with the high road running from Birkenhead to Chester.

THE GUILDHALL SCHOOL OF MUSIC EXTENSION.—DESIGN FOR THE PROPOSED BELFAST CITY HALL.—THE GRUUTHUSE PEW, NOTRE DAME, BRUGES.—REDECORATION OF SITTING AND DINING ROOMS OF THE PALACE AT DARMSTADT, FOR THE DUKE OF HESSE.—WESLEYAN CHAPEL AND SCHOOLS, BEBINGTON.—PLANS OF THE NEW PARLIAMENTARY BUILDINGS, SYDNEY, N.S.W.

Our Illustrations.

THE GUILDHALL SCHOOL OF MUSIC.

THE foundation-stone of this building was laid on Wednesday, the 21st inst. Owing to the continually increasing number of students at this school, the Corporation has found it necessary to provide more accommodation. When the present school was opened in 1886, a site for extension was reserved on the north side, and this now is about to be utilised; the area is about 3,700ft., with a frontage to John Carpenter-street of 72ft. 6in. The accommodation to be provided consists of an orchestral saloon, which, with a stage, occupies the entire area of the site, the floor being at the level of the street pavement. The saloon will extend in height to the second-floor level, and will have a gallery facing the stage. On the second, third, and fourth floors there will be on each 10 classrooms, the walls of which will be carried on girders over the saloon. The basement will be utilised for dressing-rooms, &c., in connection with stage, with which there will be direct communication. The new building will be connected with the present school at the various floor-levels of the latter. An hydraulic elevator will be provided for the use of the students and professors. The lighting will be almost entirely electric, and the heating of the various classrooms will be effected by hot-water radiators, through which fresh air will pass; no open fireplaces will be provided. Emergency exits in case of fire will be contrived on each floor. In connection with the orchestral saloon there are six exits, three being direct into John Carpenter-street, as shown in the elevation. The style of architecture adopted by the architect, Mr. Andrew Murray, the City Surveyor, is somewhat on the same lines as the present edifice, with greater freedom in the detail of the cornices, &c.

BELFAST CITY HALL.

THIS design, over and above its architectural qualities, has a special interest, because it was the one, we understand, which the local authorities at one time selected to take its place among the three chosen by the referees for the final contest, and there was no little controversy and correspondence concerning the matter. The authors of this design are Messrs. Graeme Watt and Tulloch, of Belfast, and they withdrew their plans from the competition, honourably determining the occasion of the dispute, to which we have thus impartially made a brief reference. Having published the selected design, and also one of the two placed next to it in the concluding award, we thought the illustration of this particular design, owing to the circumstances alluded

to, would prove of no little interest, particularly to those who were acquainted with the facts.

THE GRUUTHUSE PEW, NOTRE DAME, BRUGES.

THIS drawing is one of the series for which a Medal of Merit was awarded by the Royal Institute of British Architects to Mr. James A. Swan. In the Cathedral, Notre Dame, Bruges, this richly carved pew of light-oak is situated overlooking the chancel, and it was erected in 1474 for the family of Van der Gruuthuuse, whose house lies at the back, and is connected by a passage. Entrance from the cathedral is gained by the door shown; the portion below the pew is in stone, and the openings are glazed, as also the sashes to the upper part. The Gruuthuuse Palace has now been turned into a museum. The accompanying drawing gives several details and sections which add value to Mr. Swan's clever delineations of this florid piece of ecclesiastical design.

THE PALAIS, DARMSTADT, GERMANY: SITTING ROOM AND DINING ROOM REDECORATIONS.

THE two interiors, of which we give illustrations to-day by Mr. M. H. Baillie Scott, have been designed for H.R.H. the Grand Duke of Hesse. The drawings show the scheme adopted by their author in a very clear way, and as we have not been favoured with any description of the work, we are unable to give any further particulars concerning it.

WESLEYAN CHAPEL AND SCHOOLS, BEBINGTON.

THESE buildings are from the designs of Mr. T. Taliesin Rees, architect, Birkenhead, and were won by him in a limited competition. The schools and classrooms have been recently built, and are now used for chapel purposes until the latter is erected. The schoolroom is capable of accommodating 300 persons, and the classrooms about 30 scholars each. The materials are of red Ruabon bricks, with Storeton stone dressings and slated roofs. The contract was carried out by the late Mr. W. H. Bleakley, contractor, Birkenhead.

NEW PARLIAMENT BUILDINGS, SYDNEY, N.S.W.

WE give this week a double-page plan of the first floor of the new Parliament buildings, Sydney, N.S.W., of which we gave a perspective view and ground-floor plan last week.

The partnership hitherto subsisting between C. T. Marshall and R. B. Dick, under the style of Marshall and Dick, of Newcastle-on-Tyne, architects and surveyors, has been dissolved.

The dedication of a Jubilee memorial pulpit at Christ Church, Downend, Bristol, took place on Sunday. The pulpit, which was designed by Mr. H. M. Bennett, and executed by Messrs. Edwards Bros., is of oak, octagonal in shape, with solid moulded base, on which stands a pedestal of open panel work. The head is of similar design, having sunk and moulded buttresses. The top panels are uniformly traced, and the under panels carved and embossed. A heavy moulding fringes the top, while immediately underneath is a rail with carved vine-leaf design.

A Local Government Board inquiry was held at Tonbridge, on Thursday last week, into an application for sanction to borrow £2,500 for water-supply and waterworks construction for Tonbridge, before Mr. Walter E. Ducat, C.E., from the Local Government Board. Mr. Horne, clerk to the Burnley Guardians, stated that the houses had increased from 877 in 1891 to 1,260. Trade was extending, dwelling-houses were being erected, and something must be done to increase the water-supply. The yield was 12,600 gallons per day, and they proposed constructing a reservoir which should have a holding capacity for 135,200 gallons. There was no opposition to the application.

The ceremony of opening a new railway in the Isle of Wight took place on Monday. The line is single, and at present is $5\frac{1}{2}$ miles long. It begins at Merston Junction on the Newport and Sandown system, and proceeds by an upward gradient through Godshill and the picturesque village of Whitwell, at each of which places there is a station, to St. Lawrence, a village to the west of Ventnor. At the summit of the line near Whitwell Station the train enters a tunnel 620 yards long, which pierces the Down. It is intended to extend the line through the Steephill estate, and to connect it with Ventnor by a station within a short distance of the Royal Hotel and on a level with the centre of the town. Messrs. C. J. Westwood and Co., of Clement's-lane, London, have been the contractors. By the new railway the rail distance between Cowes and Ventnor has been shortened by six miles.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

EDINBURGH ARCHITECTURAL ASSOCIATION.—During the winter session of this association, Mr. Thomas Gibson, of Eglinton Crescent, put at the disposal of the council a sum of £30, to be given in prizes for the best design for a fireproof dwelling, taking as the basis of the design a house similar to those in the west end of Edinburgh. The council appointed Mr. W. W. Robertson, of H.M. Board of Works; Mr. Westland, C.E.; and the then president of the Association, Dr. Rowand Anderson, to examine and decide on the relative merits of the designs submitted. In response to the invitation of the council, five sets of designs were submitted. After their examination, the design submitted by Mr. James Cairns was placed first; that by Messrs. J. Gordon Smart and Louis Blanc, second; and the one by Mr. Alexander Arnot, third—£15, £10, and £5 being awarded to them. Mr. Gibson, in addition to giving this money for prizes, defrayed the expenses incurred by the Association for printing, &c., amounting to £12. The first and second successful competitors are assistant and pupils in the office of Mr. Hippolyte J. Blanc, R.S.A.; and the third prizeman is of the office of Messrs. J. D. Peddie and Washington Browne.

CHIPS.

The members of the Hampshire Field Club visited Whitechurch, Litchfield, and Burchlere on Tuesday week, under the leadership of Mr. T. W. Shore.

On Saturday evening Mr. Ferrand, of Bingley, set going a set of Cambridge chimes in connection with the Bingley parish church clock. The work has been done by Messrs W. Potts and Sons, of Leeds, and the cost has been raised by public subscription.

The City Court of Common Council adopted at their last meeting plans for adding a new block, containing accommodation for males and females, to the City of London Lunatic Asylum at Stone, North Kent, at an estimated cost of £46,700. The asylum was opened in 1866, and has been many times enlarged. It has cost from first to last up till now £123,000.

Messrs. Weatherall and Green sold by auction, at the Mart, Tokenhouse-yard, on Friday, a freehold building site having frontages to Piccadilly and Old Bond-street, and a superficial area of 3,210ft., with areas of vaults of nearly 1,965ft. in addition, at present let for £2,410 per annum under leases expiring together in 1904. The price realised was £115,000.

The Kaiser Wilhelm Railway Bridge, between Solingen (Rhenish Prussia) and Remscheid, the largest structure of the kind on the European Continent, was formally opened on Thursday in last week by Prince Frederick Leopold of Prussia, representing the Emperor. The total length of the bridge is 1,033ft., and that of its central span 561ft. It crosses the River Wupper at a height of 353ft. above the water level, and is thus the highest bridge in the world.

Christ Church (Methodist New Connexion) in High-street, Cradley Heath, was reopened for worship on Sunday, after renovation. The total cost of the work is about £200. The work has been executed by Messrs. Viner and Son, of Cradley Heath and Dudley, under the direction of Mr. A. S. Butler, architect, of Cradley Heath.

Lord Morley's Committee of the House of Lords passed on Monday as an unopposed measure the Bill authorising the New River Company to raise £1,000,000 additional debenture stock. This Bill has already been sanctioned by the House of Commons. The money raised by this issue will be spent upon providing the company with an independent line of pipes from the authorised Staines reservoirs.

Mr. William Farmiloe, of the firm of T. and W. Farmiloe, of Westminster, died on Sunday, after a long illness, at his residence, 15, Cedars-road, Clapham Common. Mr. Farmiloe was in his 70th year.

At the Guildhall, Walsall, on Thursday in last week, Mr. R. H. Bicknell, on behalf of the Local Government Board, conducted an inquiry with reference to applications by the town council to borrow £640 for the purchase of buildings and conversion of them into police barracks, and £1,850 for electric lighting.

The partnership hitherto subsisting between W. F. Unsworth and J. E. Newberry, architects, of Dean's Yard, Westminster, under the style of Unsworth and Newberry, has been dissolved.

In the case of Charles Carter, of Bedford, builder, the discharge from bankruptcy has been suspended for two years, ending June 14, 1899.

New Parliamentary Buildings
Sydney

Floor Plan

Engineering Notes.

BUENOS AYRES.—The new docks at this port, the largest and best-equipped on the American Continent, have just been completed, and have been constructed by English engineers and contractors. These works were authorised, says Mr. R. W. Perks, M.P., in 1882. Preliminary plans were prepared by Sir John Hawkshaw's firm, and in 1884 a concession for the works was granted to the late Mr. Madero. The work chiefly consisted in the conversion of the flat, muddy banks of the River Plate for a distance of three miles in front of the city of Buenos Ayres into a succession of basins, locks, and docks, the whole of the works being inclosed in long, massive stone walls, reclaiming a large area of valuable building land. The docks are approached by means of two newly-dredged channels, one to the south basin, the other to the north basin, these two channels converging in the River Plate some six or seven miles from the city. Upon the advice of the late Sir John Hawkshaw these important works were entrusted to the late Mr. Thomas A. Walker, who was then just completing the Severn Tunnel. Mr. Walker entered into a contract to construct the works in 1885, and after the preparation of the various detailed plans the works were started in the spring of 1887. The works were so designed that each basin or dock could be opened, and thus earn money, as finished. The South Basin, covering 35 acres of water space, was opened in January, 1889; Dock No. 1 in January, 1890; Dock No. 2 in September, 1890; the third dock in 1893, the fourth in 1896, and the North Basin last March. The docks and their equipment as originally designed were intended to cost £4,000,000. There have, however, been very great additions to the original scheme. Numerous warehouses of enormous dimensions, all of which are crowded with goods and produce, have been erected; two graving docks, now the largest in South America, have been built, for repairing warships and ordinary steamships; the hydraulic machinery has been increased, and many miles of additional railways laid. The result is that the works have cost upwards of £7,000,000. Mr. Walker died in November, 1889, and the works at Buenos Ayres have since been in charge of Mr. Charles Walker, the late Mr. Walker's nephew, who has resided at Buenos Ayres, to whom, as also to Mr. Dobson, the resident engineer and Messrs. Hawkshaw and Hayter's partner, the main share of the credit, so far as the construction is concerned, is due. The whole of the hydraulic machinery for the docks was supplied by Sir W. Armstrong, Mitchell, and Co., of Newcastle.

THE WIDENING OF THE SOUTH-EASTERN RAILWAY IN SOUTH-EAST LONDON.—The South-Eastern Railway Bill, which seeks power for the widening of the South-Eastern Railway by new lines in the parishes of Bermondsey and Horselydown, again came before the Select Committee of the House of Commons on Monday and Tuesday, the Marquis of Lorne presiding.—Sir F. Bramwell generally described the engineering features of the line and the method of spanning the 27 streets. He considered the line was laid out to provide the maximum advantage with the minimum of disadvantage.—Sir J. Whittaker Ellis, Mr. Green, and Mr. Alexander R. Stenning, surveyors and valuers, gave evidence to prove that no material damage could be done to St. Olave's Workhouse by the construction of the railway. This closed the case for the promoters, and the case was opened for the St. Olave's Union.—Mr. A. H. Newman, Mr. R. Price Williams, surveyors and valuers; Mr. S. R. Thompson, medical officer of the workhouse; and Mr. Augustus Shand, chairman of the board of guardians, gave evidence as to the damage the railway would do to the workhouse by passing within 6ft. of that building.—Mr. Rickards said the injury done to the workhouse could not be measured by the ordinary rules of compensation. He contended that the railway company should be obliged to purchase that part of the workhouse which abutted on the railway. They had spent a large sum in improving their building, and he urged that theirs was a special case for special consideration. For the Vestry of Bermondsey, Mr. E. Tewson and Mr. William Ede, surveyors; Mr. Andrew Young, valuer to the London County Council; the Rev. W. Lees Bell, vicar of Christ Church, Bermondsey; Mr. Tyler, chairman of the vestry; Rev. J. Scott

Lidgate, warden of the Bermondsey settlement; and Mr. J. C. Macdonald, M.P. for Rotherhithe, gave evidence as to the popular feeling on the question.—On Tuesday the chairman stated that the committee found the preamble proved, on condition that the railway company paid the whole of the rates on the property required for railway No. 1 (the loop-line) during the construction, the rateable value to be taken as on July 20, 1897.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.—The second annual meeting of the members of this association was held on Wednesday and Thursday (yesterday), at the Town Hall, Westminster. The retiring president, Mr. G. M. F. Gaskin (Nottingham), in the course of a valedictory address, referred to the Nottingham and Newark Water Bill, and strongly advocated the election of water boards, concluding by moving that a sub-committee on this question be reappointed. This was seconded by Mr. H. Ashton Hill, and carried, the old sub-committee, with the addition of Messrs. W. Whitaker and W. Watts, being re-elected. Mr. H. Ashton Hill, engineer to the South Staffordshire Waterworks Company, was then elected president of the association for the ensuing year. In the course of his presidential address Mr. Hill said that the association had amply justified its existence even in these early days. It came into being only fifteen months ago, and in February last it had a roll of 110 members and 32 associates. After giving an epitome of the work of the association during the past year, Mr. Hill briefly described the works of the South Staffordshire Water Company. He also touched on various matters connected with the duties of a water engineer. After luncheon Mr. W. Whitaker, F.R.S., read a paper on "Some Middlesex Wells." Mr. L. N. Ritson contributed a paper on "The Removal of Internal Corrosion from the Mains of the Kendal Waterworks." In the evening the second annual dinner was held at the Star and Garter Hotel, Richmond. On the second day Mr. W. Ingham, water engineer, Torquay, contributed a paper on "The Water Supply of Torquay," and Mr. Alfred Towler, Leeds, read one on "Pumping Machinery," in which he described the pumping station at Everton, belonging to the Liverpool Corporation, the plant in which is capable of raising from 600 to 5,000 gallons of water per minute to a mean vertical height of 102.39ft. Mr. Walter G. Kent read a paper on "The 'Venturi' Meter for the Measurement of Water in large Mains," and the last paper discussed was one by Mr. L. Holme Lewis on "Hydraulic Power Supply," read by the secretary in the absence of the author.

CHIPS.

The foundation-stone of the new cancer wing to Middlesex Hospital, now in course of erection from plans by Mr. Keith D. Young, was laid by Princess Christian of Schleswig-Holstein on Thursday in last week. The new wing faces Nassau-street, and is estimated to cost £15,000.

At Whitley, near Tynemouth, on Wednesday week, William Alderson Law, a prominent builder and popular resident in the village, who had been in ill-health for some days, was found dead at the bottom of the cliffs opposite his residence. Deceased was 37 years old, and leaves a widow and young family. At an inquest, the medical evidence showed that the cause of death was concussion of the brain and fracture of the ribs. The jury found that the deceased had committed suicide by jumping over the cliffs while in a state of temporary insanity.

Mr. Reginald St. A. Roumieu has been selected as surveyor to the Girdlers' Company. He has recently also been appointed honorary architect and surveyor to the Indigent Blind Corporation, St. George's-fields, S.E., which was established by Royal Charter.

On the invitation of the Irwell Conservancy Committee of the Salford Corporation, a conference was held on the 15th inst. of local authorities in the watershed as to the treatment of sewage. The chief point discussed was the position taken up by the Local Government Board in insisting on land filtration. A resolution was passed declaring that the advancement of scientific knowledge no longer made it necessary or desirable that the Local Government Board should in all cases continue to insist upon the disposal of sewage by land treatment.

A new theatre is approaching completion in Stoke Newington-road, N., from designs by Mr. Frank Matcham. It is to seat 3,000 persons, will be lighted throughout by electricity, and the opening is fixed for November next.

The Mablethorpe Urban District Council have decided to spend the sum of £1,000 in making a new promenade and in carrying out other improvements on the sandhills facing the sea at Mablethorpe. The erection of a sea-wall is also contemplated, as well as the provision of suitable accommodation for visitors.

In his annual statement to the London School Board, Mr. Key, the chairman of the Finance Committee of that body, stated that the estimated sum required for the year 1897-8 was placed at £31,938. The sum for repairs to buildings and furniture was placed at £108,000, or £18,362 over the approximate expenditure of the past year. This large increase should, he thought, lead the board to look very closely into the system of the repairs to schools, for he found that each school passed into the hands of the contractors for repairs on an average eight times in twenty years.

The opening services in connection with a new Congregational chapel in Sheffield-road, Barnsley, were conducted on Tuesday week. It is erected on the disused burial-ground in front of the old chapel, which was erected in 1778, and is now to be used as a Sunday-school. The new building will seat 350 persons, and is estimated to cost £1,400.

A further and definite step towards the provision of more suitable and adequate municipal buildings for Douglas, Isle of Man, was taken at the close of last week, when the town council accepted the tender of Messrs. W. Gradwell and Co., of Barrow-in-Furness, at £10,358, for the erection in Ridgway-street of a town hall, municipal offices, free public library, and fire brigade station. The architect is Mr. Arthur Ardron, F.R.I.B.A., of Westminster, whose design selected in open competition we illustrated in our issue of Feb. 12 last. Eight tenders were received, four from builders living on the island and four from English contractors.

Lord Morley's committee of the House of Lords has passed, as an unopposed measure, the Bill for tunnelling the District Railway. The Bill, which has now been sanctioned by both Houses, also confirms an agreement with the Ealing and South Harrow Railway Company, under which the District Company guarantee the capital of the Harrow Company.

On page 99 of our issue of last week reference was made to Brook House, Walbrook, and it was stated that the elevation has been carried out in Portland stone. We find this is incorrect, and that the whole of the elevation above the first cornice is in Corsham Down stone.

The Mersey Docks and Harbour Board decided on Friday, on the recommendation of the works committee, to cut down the haunches of the invert of the sills of the 100ft. entrance from the river to the Alfred Dock, Birkenhead, the cost being £2,500; to provide an annex to the shed on the quay of the Brunswick Dock; to make a roadway on the western side of such annex at the total cost of £8,000; and to rearrange and extend certain of the workshops in the dockyard of Coburg Dock, at a cost of £10,000.

Apocryph of the recent abortive proposal on the part of the Dean and Chapter of St. Paul's to remove the monument to Captain Burges in order to provide space for the Leighton Memorial, it is interesting to note that Sir Elliot Lees introduced into the House of Commons on Friday night a Bill to prevent the removal of monuments which have been erected in cathedrals or churches out of public moneys in pursuance of a vote in Parliament. The Bill was brought in and read a first time; but we fear at this late period of the session there is no chance of its being passed this year.

A new chapel, erected by the Bible Christians of Launceston, was opened on Thursday in last week. It is in the Early English style. The seating accommodation is for 270. The contract price for the work was £1,227. Messrs. Wise and Wise, of Launceston, prepared the plans, the builders were Messrs. Broad and Warren, and the plumbing and heating apparatus was fixed by Mr. Wenmouth, ironmonger, Launceston.

St. Michael's, Wood-street, one of Wren's City churches, is about to be demolished. The "front elevation and spire," masonry and fittings were sold by auction on Wednesday. Some of the memorial tablets have been removed for preservation to the adjoining church of St. Alban's, Wood-street.

The borough surveyor of Great Yarmouth, Mr. J. W. Cockrill, recently prepared a scheme for the provision of electric tramways on the overhead system at a cost of £36,000, and submitted it to the lands committee, who rejected it by 8 to 5. The matter came before the town council at their last meeting, when a resolution was carried instructing the lands committee to further consider it.

Through the munificence of Lord Llangatlock and others, the restoration of the ancient abbey church of Llanthony, Monmouthshire, is almost completed, and will very shortly be reopened by the Bishop of Llandaff.

COMPETITIONS.

ASTON.—The school board settled on Tuesday the conditions for the limited competition for the extension of the higher grade schools, and the provision of a pupil-teachers' centre and deaf school, &c. It was agreed that Messrs. Crouch and Butler, Mr. J. G. Dunn, Mr. W. Hale, Mr. E. Holmes, Mr. H. Reynolds, and Messrs. Ingall and Sons, all of Birmingham and its vicinity, be invited to compete; that the architect whose plans were considered best shall be employed to erect the schools, and that the second shall receive the sum of fifty guineas, and the third the sum of twenty-five guineas; and that Mr. E. R. Robson, the consulting architect to the Education Department, be employed to adjudicate upon the plans. His fee will not exceed sixty-five guineas, plus out-of-pocket expenses. The conditions under which the competition will be conducted stipulate that the buildings are to be constructed of brick, the frontage to be relieved with red terracotta, and the total cost must not exceed £12,000 in all.

MORECAMBE.—Messrs. Harrison, Hall, and Moore, of Lancaster, acting as referees, have reported on the plans submitted for the Hotel Metropole, Morecambe, and have awarded the first prize to Messrs. Mangnall and Littlewoods, Manchester. The selected design was marked by the motto "Experience." The conditions issued to competitors request accommodation for a first-class hotel containing 150 bedrooms, and an arcade of shops. To cost £30,000. The site of the hotel is situated at the extremity of the West-End Promenade, and surrounded by four frontages, viz.:—The Marine Drive, The Promenade, Heysham-road, Sefton-road. The two principal façades of the hotel face the Marine Drive and the Promenade with an entrance from each; the other two frontages to Heysham and Sefton-roads being appropriated by the arcade and shops; the two corners to Heysham-road being utilised for restaurants and refreshment-rooms connected with the hotel, but so arranged as to be practically separated, and in no way to detract from the high-class character of the hotel. The building shown by the selected plan is to be four stories high, exclusive of basement, and is designed in a rendering of the English 17th-century Renaissance, the material used being buff brick, terracotta, and stone. The accommodation provides for a first-class hotel, every attention being paid to the general cuisine department and the comfort of visitors, including a spacious recreation-room and winter-gardens. The following are the authors of the remaining premiated designs. The adjudicators add: "We need only say that we consider 'Experience's' designs far ahead of the second award, which is likewise in advance of the three following sets." "1897," Messrs. Essex, Nichol, and Goodman, Newhall Chambers, Newall-street, Birmingham. "Pro Bono Publico," Messrs. H. and E. Marten, 5 and 7, Charles-street, Bradford. "Dividend," Messrs. Chorley, Connon, and Chorley, 15, Park-row, Leeds. "Merlin," first of the unpremiated designs is by Messrs. Butterworth, Duncan, and Marshall, of Rochdale and Morecambe.

NEW YORK.—The National Sculpture Society announces that, through the generosity of Mr. T. Kelly, of New York, it will offer a prize for the best and second-best design for a sundial, to be competed for under its direction, the designs to be exhibited in the society's exhibition in 1898, and the award to be made at that time. The prizes are 500.00dol. for the best design, and 250.00dol. for the second-best, the competition to be open to sculptors only. The sundial is to be placed out of doors, on a lawn, free from buildings or other objects, and no restrictions are made as to cost, the prizes being for the models alone. The designs shall be submitted in plaster models, uncoloured, executed to a scale of 3in. to the foot. All models must be delivered free of expense to the society and at the owner's risk, addressed to the secretary of the National Sculpture Society, 215, West 57th Street, New York, any time during the months of January and February, 1898. The models shall bear no signature or other mark by which they may be identified, but each shall be accompanied with a plain white unmarked envelope containing the designer's name and address. Designs will be numbered in order of receipt. The competition will be judged by a committee to be appointed by the council of the society for that purpose; but the right is maintained to withhold the prizes in case no sufficiently

meritorious design be submitted. It is stipulated that the prize designs shall become the property of Mr. Kelly, who will in no case have either of them reproduced save by the sculptor designing it; and Mr. Kelly further agrees to place the prize designs at the service of the artists for reproduction for others than himself if it is desired.

TONBRIDGE.—At a special meeting of the urban district council of Tonbridge, it has been decided to finally adopt the plans submitted in competition by Mr. J. H. Phillips, of Cardiff, for the proposed technical institute and free library. Mr. Phillips's design was placed first, among 27 sent in, by the assessor, Mr. Frederick W. Hunt, of London. Some objection was taken to the plainness of the adopted elevations, and two members supported the suggestion that the committee expend another £200 or £300 to render the frontage more creditable to the town.

CHIPS.

The West Riding County Council have instructed a committee to inquire as to a suitable site for a new lunatic asylum, and report back on the subject.

Mr. R. H. Bicknell, from the Local Government Board, held an inquiry at Chasetown, Staffs, last week, as to an application by the Lichfield Rural District Council for sanction to borrow £2,600 for works of sewerage and sewage disposal. Mr. E. W. Ives, the engineer, explained the details of the scheme.

The City Court of Common Council have accepted with thanks, as a gift from Mr. Edwin Lawrence, M.A., a portrait in oils of his father, the late Alderman William Lawrence, the well-known builder and contractor. The portrait will probably be added to the permanent collection at the Guildhall Art Gallery.

On Thursday afternoon in last week memorial stones were laid for a new Primitive Methodist chapel which is in course of erection in the Hanington-road, Pokesdown, near Bournemouth. Mr. Corbin Harris is the architect, and Mr. F. Elcock the builder.

Sir Francis Marindin, K.C.B., R.E., has completed the inspection of the new railway line from Aviemore, on the Highland trunk line, to Daviot, which is six miles south of Inverness, and the work having been passed, it was opened for traffic on Monday. The stations north of Carrbridge are Tomatin, Moy, and Daviot. It is expected that the whole deviation from Aviemore to Inverness will be completed early next year.

At the last meeting of the Lichfield Board of Guardians, the visiting committee recommended the appointment of Mr. W. H. Woodroffe, architect and surveyor, of Great Dover-street, London, to advise the board as to the best method of increasing the accommodation at the workhouse, and the resolution was confirmed.

Mr. Lewis H. Isaacs and Mr. Henry L. Florence have been appointed architects for the completion of the Carlton Hotel, now in course of erection from the drawings prepared by the late Mr. C. J. Phipps. The design for the exterior will be carried out with but little alteration; but the plans of the interior have undergone considerable modification.

Mr. Walter Emden, J.P., L.C.C., V.P. Society of Architects (the chairman), and a deputation of the members of the Strand District Board of Works waited upon the Prince of Wales at Marlborough House on Wednesday to present an address of congratulation from that board to Her Majesty.

The Princess Louise (Marchioness of Lorne) opened on Wednesday the Grosvenor Hospital for Women and Children, in Vincent-square, Westminster, which has been built at a cost of upwards of £12,000, of which sum Lady Kortwright, of Grosvenor-crescent, has contributed £8,000. The buildings have been erected from designs prepared by the honorary architects, Messrs. Roumieu and Aitchison.

While bathing a short distance from the new pier which is being erected at Talmine, Tongue, Sutherlandshire, on Friday, George Wilderspoon, the inspector of the pier works, was drowned. His wife and family live in New England-street, Brighton.

An organ, built in memory of Susan, Lady Dacre, who died August 18th, 1896, was opened at Kimpton Church, Herts, on Saturday. The new organ, in which was incorporated a portion of an older organ presented to Kimpton Church by Lord Dacre in 1863, is built by Messrs. Foster and Andrews, of Hull, at a cost of £290. It was placed in an organ-chamber erected by Lady Dacre to the memory of her husband, so the organ and chamber form a joint memorial of Lord and Lady Dacre, who worshipped at Kimpton Church for more than fifty years.

Intercommunication.

QUESTIONS.

[11708.]—**Timber Buildings.**—Can any reader give a list of buildings constructed wholly or principally of wood in Lancs, Cheshire, and Dublin? Also, any book on timber construction?—G. Y.

[11709.]—**Slates.**—Where are the light-green slates to be obtained? I should like to be informed of the name of quarry, the firm, and other particulars. Builders whom I have asked seem to know very little about them.—IN DOUBT.

[11710.]—**Lead Over Window Frames.**—During heavy rains, moisture makes its appearance over a window, and has damaged the wall-paper. Is it not a good plan to insert a sheet of lead in the joint of the brickwork in the inner thickness of the wall some courses above the window head, so as to prevent the percolation of water that finds its way through the outside bricks? Any information will oblige.—INEXPERIENCED.

[11711.]—**Lightning Rod.**—How should a conductor be fixed on a house having two gables front and back, with two large chimneys stalks?—E.

[11712.]—**Trigonometry.**—The elevation of a tower standing on a horizontal plane is observed; a feet nearer it is found to be 45° ; b feet nearer still the complement of what it was at the first station, show that the height of the tower is $\frac{a}{a-b}$ ft.—B. W. L.

[11713.]—**Cement.**—Would someone having a practical experience of the matter inform me which is best for reducing materials for cement—stones or machine? If machine, what kind is considered best for the purpose? The cement is made by the dry process.—A. B. D.

REPLIES.

[11702.]—**Drainage.**—The down pipes should be made to discharge over gullies, if possible, so as to disconnect the two systems. The other plan—to connect with drain—would do if a disconnecting trap be put in; but the former method practically cuts off the down pipes from the drains, and is more independent of them.—DISCONNECTION.

[11703.]—**Eaves of Adjoining Building.**—The eaves of A, as shown by sketch, is certainly an encroachment on adjoining owner's land B, and there is no doubt, from the fact that the rain-water pipes are let into chases in the wall, that B has an acknowledged right to build. Of course, B must serve a notice on A. Were it illegal to cut away an adjoining owner's eaves, a building owner could be prevented from raising his building—a very unreasonable assumption.—FAIR PLAY.

[11706.]—**Levelling Instruments.**—Consult any book on surveying instruments for information about testing and adjusting a surveyor's level.—G.

The Plans Committee of the Aberdeen Town Council had under consideration on Friday over 20 plans of new buildings. The total value of the property is estimated at £17,000.

There was a great revival of activity at the Auction Mart last week, and properties of very varied descriptions sold with considerable freedom and at very satisfactory prices. The aggregate realisation was £320,005, about £60,000 in advance of the returns for the corresponding week in 1896. London freeholds were greatly in favour; but land, building and agricultural, has also furnished a considerable quota to the total, the tone of the market being very firm all round.

At their last meeting, the Chapel - en - le-Frith Board of Guardians approved of plans for the erection of a new board-room and alterations to the workhouse, to be carried out at an estimated cost of £4,000. Mr. Frank Osborne, of Mansfield, was appointed at the same meeting as clerk of works from among 32 candidates.

On the eve of St. Barnabas, an addition to Christ Church, Chester, was dedicated by Archdeacon Barber. It consists of a side chapel, stone pulpit, and porch. The chapel, which is built of old sandstone, from the designs of Mr. J. Douglas, is in style rather Late Perpendicular, and is enriched with windows by Mr. Kempe, given by Mrs. T. Hughes in memory of the late Judge Hughes. The windows represent—in the east window, the resurrection of our Lord, with figures on either side of St. Thomas and St. Peter; and in the two south windows St. Margaret of Scotland, St. Werburgh of Chester, St. Hilda of Whitby, and St. Winifred of Holywell. The reredos, which is also the work of Mr. Kempe, presents in carved design the Annunciation.

The rector of Millbrook, near Southampton, has decided to take down the old church (saving the tower), which, in its present condition, is a standing disgrace to the place, and to erect a small building on the site that will be decent for funerals and of use for occasional services.

There is now a sum of upwards of £15,000 available for the new chair of Public Health at Edinburgh University, and the universities commissioners have ordained that "there shall be a Professorship of Public Health and Sanitary Science in the University of Edinburgh, to be called the Bruce and John Usher Chair of Public Health," the patronage being vested in the University Court.

WATER SUPPLY AND SANITARY MATTERS.

BILTON, HARROGATE.—A Local Government Board inquiry was held by Mr. W. O. Meade-King, M.Inst.C.E., as to sanction to a scheme of main sewerage and sewage disposal for Bilton, Harrogate, for the Knaresboro' Rural District Council. There was no opposition to the scheme, which has been designed by Mr. D. Balfour, M.Inst.C.E., F.G.S., of Newcastle-on-Tyne, and consists of main sewer to provide for the development of the district, which will all converge to nine acres of land laid out on the broad irrigation principle, the sewage being first precipitated with aluminio-ferric in large tanks. The effluent is to discharge into the River Nidd.

LONG BUCKBY WATER SUPPLY.—The Daventry District Council, having received seventeen schemes for the above, selected four for submission to Mr. John Unson, C.E., of Northampton, who advised the acceptance of the project of Messrs. Usill, Browne, and Usill as "being the best and most practicable."

CHIPS.

A new Roman Catholic Church, built from designs by Mr. Edmund Kirby, of Liverpool, was opened at Hoylake, in the Hundred of Wirral, on Sunday.

The Lord-Lieutenant of Kent (Earl Stanhope) visited Folkestone on the 12th inst., and formally opened some large new schools which have been built under the direction of the Folkestone School Board by Mr. G. W. Prebble, the architects being the late Mr. Joseph Gardener and Mr. E. Wilks. The new school, which is situated in Sydney-street, will accommodate 780 children—viz., 330 infants, 200 girls, and 250 boys.

The memorial-stone of a new infirmary which is being added to the South Metropolitan School at Witham, Essex, was laid last week. Mr. Frank Whitmore is the architect, and Mr. Ernest West the builder.

Lord Meath, on behalf of the Metropolitan Public Gardens Association, performed on Tuesday the ceremony of opening to the public the old churchyard and burial-ground, three acres in extent, of the parish church of St. Matthew, Bethnal Green.

The new higher grade schools erected by the Bradford School Board in Byron-street, and named the Hanson Schools, were formally opened on Monday. The building, inclusive of special science and art fittings, has cost £15,000.

The London County Council decided on Tuesday, on the recommendation of the highways committee, to seek power next session for the construction of a tramway from the existing termini of the London and South London Tramways Companies at Westminster Bridge-road, along the centre of Westminster Bridge and the whole of the Victoria Embankment to Blackfriars Bridge.

Mr. Robert H. Bicknell, one of the inspectors of the Local Government Board, held an inquiry at Castle Bromwich on Friday last with respect to an application by the rural district council for the sanction to a loan of £2,000 for works of sewerage. Mr. J. E. Willcox, C.E., of Birmingham, attended, and explained the scheme, which provided for the complete sewerage of the village, the sewage being dealt with on land recently acquired by the Birmingham Tame and Rea Drainage Board. After the inquiry the inspector proceeded to view the locality. No opposition was offered to the scheme.

The Staffordshire County Council having made application to the Local Government Board for sanction to borrow £30,300 for the purposes of carrying out necessary extensions, alterations, and improvements at Burntwood Asylum, a public inquiry was held at that institution on Tuesday week by Mr. Robt. H. Bicknell, one of the inspectors of the department. Mr. G. H. Stanger, the architect, produced the plans, and stated that his original approximate estimate for the buildings was £27,700, based on the cubing of the work, but that in drawing out the quantities he had come to the conclusion that a larger sum might be required. Dr. Spence said that, in addition to the money required for the buildings, he estimated that about £4,000 more would be necessary for clothing and furniture. Tenders for the works had been received, but had not yet been opened.

The Queen, on Thursday evening in last week, accompanied by Princess Henry of Battenberg and the Countess Feodore Gleichen, drove to the parish church of Holy Trinity, Windsor, and was there received by the rector, the Rev. Arthur Robins, who showed her Majesty the clock that has been erected on the tower of the church in commemoration of the Diamond Jubilee. The clock, which has four dials and is illuminated, chimes the quarters and strikes the hours. It has been manufactured by Messrs. Potts, of Leeds and Newcastle. By her Majesty's command, Mr. Potts, the maker, was presented to her by Sir Arthur Bigge.

Our Office Table.

THE select committee on the appropriation of sites for Government Offices practically agreed on Wednesday upon the draft report submitted by Mr. Akers-Douglas as chairman. They confirm the interim report of last year in favour of appropriating the site of Carrington House in Whitehall, opposite the Horse Guards, for the new War Office; they support the proposed widening of Parliament-street to a line parallel with the front of the Home Office, and they recommend an opening from the Mall to Charing-cross.

By a codicil to his will, Sir Augustus Wollaston Franks, late Keeper of British and Mediaeval Antiquities in the British Museum, who died on May 21, aged 70, has left to the trustees of the British Museum all collections lent by him to the said museum or to any other museum or exhibition, his collection of finger rings and personal ornaments of olden times, and any curiosities or works of art in his possession at the time of his death, which the trustees may please to select, excepting oil and water-colour paintings, prints, and books and manuscripts not specifically bequeathed to them. He has also bequeathed to the said trustees for preservation in the Print Department his collection of book plates (*ex libris*), trade cards, and tickets, together with his catalogues of the same, and certain books belonging to the collection of book plates. He further bequeathed to the trustees such of his books on pottery and porcelain as are not already in the library of the department of British and Mediaeval Antiquities to be added to the said library. Sir Augustus Franks bequeathed to the Society of Antiquaries of London, of which he was president, such of his printed books on antiquities, art, history, and genealogy as are not already in the library of the said society, together with his heraldic manuscripts and any of his drawings and engravings of ancient seals which the society may desire to possess.

UNDER this will the museum trustees become possessed of the finest and most extensive series of book-plates in existence, of a superb collection of Continental and Oriental porcelain and faience, and a number of the choicest examples of Mediaeval and Renaissance art. The bequest also comprises the unique collection of drinking-vessels formed by the testator. Among the most remarkable of the objects are a silver dish, from Central Asia, with a figure of the Sassanian King Sapor II., a gold head, jug, bowls, and other objects found in the river Oxus; a silver bowl found in Lancashire full of coins of Canute, and a treasure-hoard of Carthaginian silver bowls and spoons, found in the hill of St. Louis at Carthage. The drinking-vessels include five mazar bowls, four of them English; among them one given by Robert Pechum to the refectory at Rochester in 1532. The fifth, in its ancient leather case, is that of Louis, the last Count of Flanders, whose devices and arms are upon the foot. There are also an Arab crystal cup of the 13th century, in a Flemish mount of the 14th century; the Goodricke cup and the Aston tankard, the former of which was, like the latter, originally formed of an ostrich egg; a globe cup dated 1569, with a map of the world; and a small tankard of clear glass with the arms of the great Lord Burleigh in enamel; a fine morse of translucent enamel representing the birth of John the Baptist—a piece of Siennese work of the 14th century of unusual excellence; while the jewelry contains a series of finger-rings, principally Anglo-Saxon, among others the ring of Ethelwulf's daughter, Ethelswitha, Queen of Mercia, found in Yorkshire.

THE Highgate Woods Preservation Bill came before the committee of the Earl of Morley on Monday. This scheme is the outcome of the efforts of the Commons Preservation Society, Kyrle Society, the Metropolitan Public Gardens Association, and the National Trust for Places of Historic Interest and Natural Beauty. The object is to preserve the Churchyard Bottom Wood, 52 acres in extent, which is reputed to be part of the primeval forest of Middlesex. It covers ground that rises in a gentle slope from Crouch-end up to Muswell-hill-road, and is the property of the Ecclesiastical Commissioners, who are willing to part with it as an open space for the sum of £25,000. Towards the amount required the Hornsey Urban District Council

will contribute £10,000, the Islington Vestry £2,000, and the trustees of the London Parochial Charities have promised £1,000. St. Pancras will contribute £1,000, Middlesex County Council £5,000, whilst private subscriptions amount to £5,500, leaving about £4,000 still to be provided. The Bill, which was unopposed, was passed, and ordered to be reported to their lordships' house.

ACCORDING to a report submitted to the House of Commons on Wednesday, concerning the work of the Public Record Office in 1896, the systematic calendaring of the patent rolls from the reign of Edward I. to that of Henry VIII. inclusive is making steady progress. The work was begun at five points, and the position of affairs at the end of last year may thus be summarised:—Edward I., 34 sheets, comprising the whole text of a volume covering the period between the 30th and 35th years of reign, completed at press. Edward II., 33 sheets of second volume completed for press. Edward III., 20 sheets of fourth volume completed for press. Richard II., 39 sheets, comprising the whole text of the two volumes for this reign, completed at press. Edward IV., 36 sheets, comprising the whole text of the first volume for this reign, completed at press. One volume for each of these five reigns will be ready for publication in the course of the present year. It is further announced that Mr. W. H. Stevenson has been engaged upon a general introduction to the Close Rolls of the reign of Edwards II., which will be prefixed to volume four of the calendar for that period; that the text for the first volume of the Calendar of Inquisitiones Post Mortem of the reign of Henry VII. was ready for press at the end of 1896, and that considerable progress had been made with the index thereto; that a similar calendar for the reign of Edward II. had been begun; that 48 sheets dealing with the State papers (domestic series), reign Charles I., were ready for press; that the period covered by the reign of Charles II. had been dealt with down to May, 1672; that further materials had been collected for a volume relating to the Irish administration of the Earl of Essex (reign of Queen Elizabeth); and that Mr. R. P. Mahaffy had begun calendaring the Irish papers of Charles I., the Commonwealth, and part of Charles II.

DURING the process of excavations incidental to the rebuilding of a shop in Northgate (or Shoemaker's) Row, near the centre of Chester, the workmen recently came upon the base of a large Roman column *in situ*. The fact that this relic occupies the exact spot in which it was placed by Roman workmen 16 centuries ago adds largely to the interest which the discovery has excited. It is of native red sandstone, and rests upon the natural rock, some 2ft. below the level of the present street, and almost in a line with the west side of Northgate-street, which some archaeologists have contended follows the line of one of the ancient Roman *vias*. The block is 4ft. 6in. square, with a base moulding 15in. thick worked upon it, and is in a good state of preservation. The diameter of the column is shown to have been 2ft. 10½in., or three Roman feet, of 11½ English inches to the foot. A day or two after the base was discovered a column, if not the identical column belonging to this base, certainly one of the series, was partially unearthed. It is lying in a horizontal position, a few feet from the base, with a modern party-wall built across it. A few Roman coins, also in a good state of preservation, have been found upon the site. The columns which stood upon this and similar bases must have been equal to eight, if not nine diameters, or 24ft. or 27ft. in height, and there must have been at least two, but more probably four or even six, of them if, as appears likely, they formed the front of a Roman basilica or temple, and the building generally must have been of very imposing proportions. At present it is impossible to say whether these columns formed the east or west front of such an edifice, but further discoveries may help us to come to a conclusion. The owner of the property, Alderman Charles Brown, has already decided that this very interesting evidence of the importance of the ancient Roman city of Deva shall remain *in situ*.

THE annual meeting of the general committee of the Palestine Exploration Fund was held on Tuesday afternoon at 24, Hanover-square, under the presidency of Mr. James Glaisher, F.R.S. The report drew attention to important results of the

excavations at Jerusalem by Dr. Bliss, and the meeting was afterwards addressed by Dr. Bliss himself, who is on a visit to this country. The limits of the Pool of Siloam have been determined, and portions of the rock-hewn steps which led down to it have been found. The church which was known to have existed at Siloam has been discovered, and its plan, which presents many features of interest, has been ascertained. The paved street, which has been followed a long distance up the Tyropoeon Valley, is apparently that by which the pilgrim Antoninus (570 A.D.) descended from the "Double Gate" or "Triple Gate" of the Haram to Siloam.

FOLLOWING the example of Germany and Italy, our Post Office authorities are forming a museum illustrating the evolution and progress of the post. A very good nucleus for an interesting collection has already been obtained, and a room set aside for it at St. Martin's-le-Grand. Here will be preserved the historic records relating to the early history of the Post Office, warrants, notices, old cables, official literature, and models of mail coaches of past days, uniforms, and a very valuable collection of postage stamps, which is to include an example of every stamp issued by the British Post Office. In order to make this collection as complete as possible, recourse has been had to Somerset House, where the old dies are kept, in those instances where no specimens of particular issues could be found at the General Post Office itself.

THE Improvement and Public Works Committee of the Birmingham City Corporation have come to an understanding concerning the proposed widening of Steelhouse-lane, in that city, which involves not only the giving up of land by the Improvement Committee, but certain compensation to occupiers of property affected—among them the Children's Hospital out-patient department, for which a new frontage will have to be constructed. The Public Works Committee have agreed to carry out the street works and to contribute £2,570 towards the cost falling on the improvement scheme. The upper portion of the thoroughfare is now but 30ft. wide. This will be increased to a minimum of 43ft., and an average throughout the whole street of about 45ft. The street line has already been set back between Ebenezer Chapel and the Victoria Courts Lock-up, involving the giving up by the Improvement Committee of about 900 square yards of land. The widening of the upper part involves the giving up of about 700 square yards additional. The Improvement Committee also intend to set back the line of frontage opposite the new General Hospital.

THE South Shields Corporation are pushing on with their town improvements, and mean to exercise the powers conferred upon them by their recent Parliamentary Bill, which has now been passed. Various schemes are at present under consideration for the widening of certain main streets. The first work in connection with these improvements to be proceeded with will be the widening of Church Way, the necessity of which was first pointed out some years ago, and put off from time to time until it was inserted in the Parliamentary Bill. In order to accomplish this improvement, a large slice of ground will be taken from St. Hilda's churchyard, running from the entrance gates, and cutting off the west end corner of the churchyard. This new piece of road will go over the top of a number of graves, and these it is proposed to cover with a solid bed of concrete of 2ft. in thickness. The final inquiries with respect to the improvements are now being made by the Home Office; and as soon as the medical officer of health's report has been sent in approving of these alterations from a sanitary point of view, the work will be put in hand. With regard to the widening and straightening of Ocean-road, the committee who have had the matter under their consideration have resolved, subject to the approval of the council, to acquire the abutting property opposite the Congregational Church. The owners have offered it to the corporation for the sum of £10,000, but that proposal has been refused, and the committee have decided to recommend the council to offer the sum of £5,250 or proceed to arbitration at once. A number of premises in King-street have been scheduled in the Bill, as well as the property running up Mile End-road, and all the premises in Fowler-street between King-street and Keppel-street.

THE City Commissioners of Sewers will further

consider at their meeting on Tuesday an important scheme for the establishment of a refuse farm recently brought forward by the Streets Committee. The proposal is to follow the example of Glasgow in the matter of cleansing. The refuse would be conveyed by barge down the river to a site at Hornchurch Marshes, near Barking, comprising about 160 acres of agricultural land, and the Romford Canal, comprising about 35 acres. Here the refuse would be sifted, and that portion suitable for use would be used for agricultural purposes. The price named for the site was £25,590. The Commissioners have referred the matter back to the committee until next Tuesday to allow of the circulation of further information as to the methods of the Glasgow Corporation in dealing with this important matter.

In a Harben lecture, delivered at King's College on Wednesday week, Dr. Sims Woodhead discussed "Biological Filtration" with reference to sewage disposal. After giving a short account of the manner in which the teeming micro-organisms of the soil break up and decompose any organic matter placed in the earth, he said the aim of biological filtration was the artificial production of similar conditions and results. He proceeded to describe the Exeter process of sewage disposal. The sewage was first passed slowly through a preliminary fermentation tank, where it was acted upon by various anaërobic organisms; it was then oxygenated by exposure to the air; and, lastly, run into filter beds. The effluent from these was usually bright, with little or no smell. The filters were composed of layers of coke in various states of subdivision, and the coke was only active by virtue of being coated with micro-organisms, without which it merely operated to a very limited extent as a mechanical filter, and not at all as a biological one. Dr. Woodhead exhibited a series of tables showing the numbers of micro-organisms, both aerobic and anaërobic, which were found to be present at the various stages of the process, and also the chemical changes taking place as a consequence of their activity. He remarked that both intermittent filtration and land filtration were only imperfect ways of carrying out biological filtration, and expressed his belief that the process would become of great importance in the future, and would be found capable of yielding very good results.

THE question of providing for the public architecture of the United States is likely, the *American Architect* ventures to predict, to find a tolerably satisfactory answer under the administration of the present Secretary of the Treasury, who has issued an order putting in force the provisions of the Tarsney Bill. It is understood, too, that the new supervising architect is to be chosen by competitive examination, and that the American Institute of Architects will be represented in the examining board. The new supervising architect will hereafter, it is understood, devote himself mainly to the conduct of the business of the office, while the designing of new buildings for the Government will be, so far as existing laws permit, intrusted to private architects, selected by some form of competition. What that form will be remains to be seen, but Secretary Gage apparently appreciates the value of good architecture.

The new Victoria Pavilion in connection with the Winter Gardens at Morecambe was opened on Monday last. This place has been erected by Messrs. S. Whitehead and Sons, from designs by Messrs. Magnall and Littlewood, architects, Manchester. The facade is built of terracotta from Ruabon, and is constructed with two large balconies facing Morecambe Bay. The stage is 72ft. wide by 35ft. deep and 60ft. in height, and the span of the main roof is 118ft. from wall to wall.

The half-yearly report of the City and South London Railway Company, published on Wednesday, states that considerable progress has been made with the works of the extension to Finsbury-pavement. The shafts at London Bridge and Moorgate-street stations have been sunk to the full depth, and the driving of the tunnels commenced. The difficulty experienced as to the settlement with the rector and churchwardens of St. Mary Woolnoth for the acquisition of the church for the construction of the station underneath compelled the directors to apply to the Board of Trade in order to obtain possession in accordance with the Act of Parliament. By direction of the valuer appointed by the Board of Trade, a large sum having been deposited with the Paymaster-General as security, possession of the site was at length obtained in May last, and the works are now being proceeded with.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Society of Architects. Day Visit to Canterbury. Train from Victoria 11 a.m.

CHIPS.

The bust of the Queen as Empress of India, by the eminent Italian sculptor Norini, has been placed in the Oriental Institute, Woking, by Dr. Leitner. It is supposed to be the only bust which represents her Majesty in that character.

A new bonded warehouse has just been built in Great Patrick-street, Belfast, from designs by Messrs. Graeme Watt and Tulloch. The premises occupy an isolated site of 78ft. by 68ft., and bounded on all sides by streets, and are five stories in height.

There was inaugurated at Bagillt, near Holywell, on Monday, an enterprise which should, in the near future, lead to a considerable development in the lead and coal-mining industry in Northern Flintshire. This was the cutting of the first sod at the entrance to the tunnel about to be driven from Bagillt to Halkin, primarily for the purpose of unwatering the Milwr lead-mines, and thence on to Halkin, as a result of which it is expected that it will become practicable to work a large number of lead and coal-mines which are now closed on account of the water.

The members of the Bristol Association of Clerks of Works and Builders' Foremen paid a visit on Saturday to Combe Down Quarries of the Bath Stone Firms, Limited. They were conducted by the manager, Mr. George Hancock, who took them through the present workings, and explained the geological formation and the qualities and methods of obtaining and working the stone, and rendered the outing both very interesting and instructive. The company, which numbered over 30, then adjourned to the Mechanics' Institute, Corsham, where a substantial dinner was provided.

The Grove Academy at Broughty Ferry has just been enlarged by the addition of an eastern wing from designs by Messrs. James Maclaren and Sons.

The new fire station in Carmelite-street, Whitefriars, was officially opened on Wednesday afternoon. The chairman of the Fire Brigade Committee, in declaring the station open, said that this was the largest station in London except the headquarters in Southwark. It has been built from plans by Mr. Thomas Blashill, superintending architect to the London County Council. It is eight stories in height, and above it an octagonal and pinnacled look-out tower rises to a height of 120ft. from the pavement. The outlay has been £21,000, besides £16,000 expended on the site.

The excursion of the Essex Archaeological Society took place last week, when the members met at Southminster railway station and visited the water-works and church at Asheldham and the ruins of St. Peter's Chapel and the adjacent Roman camp at Bradwell-juxta-Mare. Papers were read by Dr. Laver, of Colchester, and Mr. G. F. Beaumont, of Coggeshall.

A select committee of the House of Lords passed on Monday the preamble of the Watford, Edgware, and London Railway Bill. This railway is meant to connect the towns of Edgware and Watford, the line to Mill-hill connecting with the Midland line having been abandoned. The capital of the company is fixed at £300,000.

The first section of St. Teilo's Church in Woodville-road, Cardiff, was opened last week. It consists of nave and aisles, and accommodates 1,750 persons. It is Perpendicular in style, and is built of Sweldon stone with freestone dressings. A chancel, morning chapel, vestries, and organ-chamber, and tower 130ft. in height have yet to be built. Mr. George E. Halliday, of Cardiff, is the architect, and Messrs. S. Shepton and Sons, of Cardiff, were the builders.

A county police station has just been built at Seaforth, near Bootle, from designs by Mr. F. Holme, of Liverpool. The building is two stories in height, covers an area of 160ft. by 150ft., and is faced with red bricks and red sandstone dressings. A court-room is provided, as well as accommodation for a superintendent, inspector, sergeant, and nine constables. Mr. Walter Musker, of Bootle, was the contractor, and Mr. Grocott, the clerk of works.

On Saturday, the Horsham Museum Society inaugurated the fifth year of its existence by a joint excursion with the London Toynbee Anti-quarian Society to the parish churches of Steyning, Bramber, and Shoreham, under the guidance of Mr. J. L. André, F.S.A., of Horsham, a member of both societies.

A police-station and sessions-hall are about to be built at Broadstairs, for the Kent County Council. The buildings will include two cottages, single men's quarters, four cells, and a magistrate's court, and will be erected from plans by Mr. Frederick W. Ruck, county surveyor, of Week-street, Maidstone.

Trade News.

WAGES MOVEMENTS.

IPSWICH.—The four gentlemen appointed to arbitrate in the matter in dispute between the master builders of Ipswich and the Amalgamated Society of Carpenters and Joiners—Mr. G. F. Josselyn (who presided), Lord John Hervey, Mr. F. H. Fosdick, and the Rev. E. J. Gilchrist—sat at the town hall on Wednesday week for nearly five hours, and issued their award on Friday. They decided that all work done after the completion of a ten hours' working day or any other day than Saturday, and a 6½ hours' working day on Saturday, shall be considered as overtime. This overtime shall be paid at the rates of one penny per hour for the first and second hours, twopence per hour for the third and fourth, and for all subsequent hours at the rate of fourpence per hour. All work done on Sunday and Christmas Day shall be paid for at the rate of double time. The ordinary pay per hour is 7d.

LIVERPOOL.—The plasterers' dispute in Liverpool still remains unsettled, and the largest building operations are delayed, notably the Post-office, School Board Offices, University Buildings, Fire Police Offices, Cook-street, White Star Offices, Toxteth Infirmary, Teachers' Training College, &c., owing to the attitude assumed by the men. On the 1st of May the men put forward their demands for an increase of wages and alteration of rules. Meetings were held and the matters discussed, with the result that the employers agreed to the advance of wages at the rate of ½d. per hour, but could not agree to the alteration of rules as suggested by the men. The employers suggested arbitration, but to this the men could not agree, and went out on strike.

There is a fair probability that the Locomotives on Highways Bill will be passed this session. It deals with heavy traction engines, and while removing the vexatious nature of the present restrictions, gives improved powers to local authorities. It has been drawn on the recommendations of last year's Select Committee. The Bill has been before the Standing Committee on Trade, and after a long discussion and some opposition was passed.

At a meeting of the Birmingham Baths and Parks Committee on Monday it was decided to recommend the city council to proceed at once with the erection of the promised baths for Small Heath, at an estimated cost of £25,000. The site of the baths adjoins the free library in Little Green-lane. It is intended to provide first and second class swimming baths, private baths, &c.

The Wrenthorpe Schools, near Wakefield, are being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet panels, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The House of Lords affirmed on Monday a judgment of the Court of Appeal, holding that the London County Council were not liable to be rated by the churchwardens of Lambeth in respect of Brookwell Park. The Queen's Bench Division decided that the estate was beneficially occupied by the Council, but the Court of Appeal took a different view, declaring that no part of the property could be a source of pecuniary profit to the respondents.

The Government of India have approved of approximate estimates, totalling £72,500 sterling, for the reconstruction, on their present site, of barrack and hospital buildings for the British Infantry at Benares.

Mr. Phillips held an inquest at Wolverhampton, on Tuesday, with regard to the death of Thomas Harry Lander (33), painter, of Stockwell End, Tettenhall, who died in the General Hospital. The deceased was engaged in painting some houses at Church Hill, Tettenhall. On Friday morning he was standing on a ladder, which slipped, owing to some spouting giving way, and a man named Thomas Taylor, who was working at the top of the ladder, fell on to the deceased, knocking him off. Both dropped on to the back of a man named Joseph Foster. The deceased struck the ground and seriously injured his spine, but Taylor escaped with a few bruises. A verdict of "Accidental death" was returned, and the coroner congratulated Taylor on his marvellous escape after a fall of 33ft.

On Saturday last Mr. Thomas Fielden, M.P., opened a new Conservative Club at Whitworth. It is a substantial structure, chiefly composed of Yorkshire stone, and contains a large assembly-room, billiard-room (in which there are two large tables), committee-room, reading-room, conversation-room, bar, and ante-rooms. Mr. Joseph Law, of Whitworth, was the builder, and Mr. Norcliffe Mills, of Rochdale, the architect. The total cost is about £1,200.

THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2221.

FRIDAY, JULY 30, 1897.

THE HOUSE AND THE GARDEN.

HAPPY is the architect who can set his house on an uneven site! Happier still is he who can plant it on a rocky one, and happiest of all the man who has irregular masses of stone to build on, cropping out amongst turf and soil. From such sites, indeed, the architectural tradesman will pray to be delivered. He can see no possibilities in them, and only one certainty—the certainty of extra trouble to himself. His stock house plans will not “work in”; an uneven site calls upon him for invention and adaptation, and, if he ever had any power of inventing and adapting, it has long ago perished through disuse. The only course he can advise is to have the space levelled before he begins. He will then have a horizontal platform to start with, and this being provided for him at indefinite expense to his client, he can go on the beaten track again and do once more what he has done a hundred times. Enough of the architectural tradesman—twin brother to the jerry-builder, and spoiler of all the beauties of our land from Cumberland to Cornwall.

The real architect, on the other hand, will feel that now at last he has got a chance. How, with skill and infinite care, he will so shape structure to the ups and downs of the place it stands on, that it looks almost from the first like a part of nature. Nineteen buildings out of twenty have no vital relation whatever to the sites they occupy. They might be moved, in American fashion, to the next piece of ground, or even to the next town or village, and they would be no worse and no better fitted to their new surroundings than to their old ones. With a flat, characterless site it is difficult to prevent this, but there is no excuse for it on uneven ground. Even a few grassy mounds, with the walls artistically fitted to them, will give a house the priceless individuality which no outlay on materials or decoration can ever confer. But the fitting must be of that highest type in which art conceals art. If it is well done, people will not say “How architectural,” but “How natural!”

There is some modern, and a great deal of ancient, work, in which this result is attained. Amongst the former, Lord Armstrong's house at Craigside, by Mr. Norman Shaw, will inevitably suggest itself. It is rare to get such opportunities in the way of surroundings, and rarer still to use them so well. Amongst old buildings look at Harlech Castle, so moulded to the place it is planted on that one can hardly tell where man's doings begin, and where Nature's end. Look at Conway and Carnarvon, and Pembroke, look at St. Michael's Mount, at Dartmouth Castle, at Durham Cathedral; or abroad at that of Limburg. All these structures seem inseparable from their sites. They appear to have grown rather than to have been made. There is no sharp line between them and the rocks they rise out of; it is as if the solid strata for once had shot up and flowered, with turrets for stems, and gables and tracery for blossoms.

An architect may work for a lifetime and not get such chances as these. But he often fails to make the best of such chances as there are. The failure may be due to himself, or it may be caused by the conditions under which he works. The building owner naturally thinks, “I will have an architect to design the house, and a gardener to design the garden.” Well and good, if the house and the garden were not going to

be seen together; but since they are, the building owner is simply arranging for a duet in which each performer will select his own music and sing in his own key. This is one way in which modern houses jar painfully with their surroundings. It is nobody's business to see that they do not, and if the architect tries to make them agree, in comes the gardener, or the layer-out of gardens, and upsets him. It is no wonder if, after a series of such experiences, he gives up hope, or only trusts that time and chance may do for his building what he has not been allowed to do for it himself. Sometimes they do wonders for it. First of all, they obliterate the hard, hateful line where the walls meet the ground. The rain splashes them, and the dust sticks to them, and the moss grows on them just at their junction with the ground, and soon, for the first foot or two in height, the transition from the natural to the artificial grows almost imperceptible. Then the line is further broken, perhaps, by flowers, or grass, or shrubs, till the house looks less like a box set down for the carrier to remove, and more like a thing belonging to this beautiful earth. We are luckier in these points than our neighbours across the Atlantic. Mr. Burroughs, the American naturalist, found himself constantly wondering at the way in which everything here gets grown over. It was a novelty to him that grass should cover the wall-tops in England, that weeds should soon hide every patch of bare soil, and that a brilliant cluster of crimson flowers (red valerian, perhaps) should push out from between the stones of a cathedral tower, 80ft. or 100ft. from the ground. It is clear that we do not make the most of our advantages.

A small school of modern architects, some of them clever, have been trying to bring the house and the garden into harmony by making the latter extremely formal. Yews and cypresses, box-trees and cedar-trees, clipped hedges and “topiary-work,” are amongst the things that most attract them. Parapets and balustrades, formal walks and leaden images, too, are dear to their hearts, and for the latter fancy in particular they were severely taken to task two or three weeks ago in *Gardening Illustrated*, by a writer with the well-known initials of “W. R.” All statuary, whether in lead, stone, or marble, is, in our view, a thing that can very well be spared from the English garden, not simply for “W. R.'s” reason, that it is likely to be bad in art, but still more because, whether bad or good, it is art out of place. In the English climate statues are best under cover, and even if he had the pick of those in the British Museum, no sensible man would want to set them up in his garden. The universal veil of green, which Mr. Burroughs speaks of so lovingly, soon falls on statuary as on other things; but while it makes most things more beautiful, it only renders Classic sculpture ridiculous. For the rest, we may leave yew-trees and “topiary-work” to those who want them. An able man can make something worth looking at out of anything that takes his fancy. The world is wide, and this sombre style of gardening is not likely to overspread it. Its origin, of course, is that modernest of modern feelings, which hates the times it belongs to, and is never happy unless it can imagine itself in the company of its great-great-grandfathers. This is the malady of the age—a malady which the periods when art flourished never dreamt of—and it affects society all round. The newspapers announced, only the other day, that a brisk trade in spiders is now carried on, and that they are sold by the dozen to spin cobwebs over new port-wine bottles, that they may pass for old. The “topiary-work” and the lead figures are, to some architects, what the spiders are to some wine-merchants.

Yet there is an excuse for these dismal experiments in gardening. Those who make them feel by instinct that the site and the

surroundings of a house should in every case have a character of their own, and that the house used should accentuate and emphasize this character. The average building site has no character. It is a mere geometrical figure on a plane surface: an oblong, perhaps, of 60 yards by 20, indistinguishable in appearance from scores or hundreds of similar oblongs in its neighbourhood. The “topiary” and lead-figure and balustrade architect wants to make it distinguishable, and brings in the fashions of two centuries ago to do it. But there are other and better ways. The architect should feel that not only the house, but the site pertains to him to deal with, and he should qualify himself for dealing with it well. If he finds it flat, he need not always leave it so. The innumerable loads of sod which the builder carts away from the foundations would often be invaluable near the house, if wisely placed. The brick areas which he builds to keep the basement dry might often be omitted with advantage, and sunk walks with slopes of turf or flowers formed in their stead. Such things could be managed at little cost, and sometimes even with a saving of money. It is only an architect here and there who has much horticultural knowledge; but most of us, with taste and skill, might learn to form the groundwork of a beautiful garden.

ARCHITECTURAL OUTBREAKS.

EVERY style has had its exaggerators; those who have taken some leading characteristic and made it conspicuous. The early revivalists were in a manner caricaturists. One took the towers and pinnacles and gables of the Mediæval fortress or church or conventual group of buildings, and reproduced them in picturesque medley, like Beckford did at Fonthill and Walpole at Strawberry Hill. There was a touch of romance in thus picking out salient features and presenting them in a chaotic disorder in keeping with the landscape painter and landscape gardener, who had both studied the elements of the picturesque. Look how the Gothic window was caricatured, how the pointed arch was attenuated by arcs of enormous radii till their sharpness destroyed the beauty and grace of the arched form, and became exceedingly restless and irritating. Again, the pinnacle and the spire suffered from the same epidemic. The angles blossomed out into crockets of prodigious size. Turning to the other phase—the Classic style—the craze for porticoes and columns and windowless exteriors defied every sense of moderation, and poets and satirists ridiculed in verse the bombastic erections of the day. One can now scarcely seriously think that St. Pancras Church in the Euston-road was not a joke for a Christian Church, or that it was necessary to build a huge peristyle to a building for any civic or municipal purpose, or to perpetrate such a solecism of the Doric Order as that which forms the entrance to the Euston Station. In both instances the revivalists of these styles seized certain features and satirised them. Heathen uses or local material were immaterial. Of course, they never intended to bring into ridicule features which they valued so highly and admired so ardently; but the result has been nothing short of a burlesquing of the Mediæval and Greek styles. We find the same architectural phenomena presented in later years. The devotees of Æstheticism, Queen Anne, and Japanese, by their fantastical developments and extravagances, ridiculed and travestied those styles. And the same can be said of Ruskinism, the influences of Rossetti, Burne Jones, William Morris, and other leaders of art decoration. Each had something peculiar and exaggerated, with much that was beautiful. We all remember the time when our woodwork

and dadoes were painted in sombre dull green of a bluish shade, when sad and weird-faced maidens peered out from our furniture panels and tiles and plaques, and when sunflowers and daisies adorned everything from wall panels to coal-scuttles. These artistic eccentricities have had their day, but they have left their influence for good upon our decoration and buildings, and our work of to-day is all the better for these epidemics of style.

We can look back through half a century and smile at the earlier of these extravagances. But are we not guilty of the same thing to-day, though in a less flagrant manner? We do not exaggerate the peculiarities of styles so much, but there is the same tendency to imitate types of building and the eccentricities of individual men. It is less offensive, because we recognise buildings more as a whole—their arrangements and structure, not merely details peculiar to the style. For example, we build a house after the style of an old manor house or a "Queen Anne" or Georgian house, but keep more to the sense and spirit of the style than our forefathers did. Our copying is more intelligent and patient. We see some merit in every style, and it is in this spirit that our modern buildings are designed. The same cosmopolitanism of taste which has prevailed here has been at work in the United States. Since the Civil War waves of English Gothicism, Æstheticism, the styles of Louis XIV., Louis XV., Louis XVI., and the Empire have passed over the land, each leaving its mark in some extravagant degree. Now a more refined Renaissance is taking the place of those over-elaborated styles, and all these revivals of taste have been educative. But, although this eclecticism is more intelligent than it was and less addicted to fasten on one or two features, like the Classic column or the Gothic window, there is still a tendency to exaggeration and extravagance. Travelling facilities and the sketch-book have had something to do with it. The young architect goes to, say, Belgium, and brings home certain features and treatments which he henceforth uses in all his buildings; it may be a feature from the Hôtel de Ville, a storied pinnacle or a traceried window from Louvain; it may be a carved wood-framed story from Rouen, or a cusped traceried doorway from Valladolid. It appears in the latest new front, or in the last villa, and it lords over all the rest of the work or assumes an exaggerated importance in the design. We have had epidemical outbreaks of porches, pediments, oriels, roofs, gables, in all of which one of these features has been exaggerated at the expense of others. Many are excellent treatments, no doubt; but this is due to the author's artistic sense of harmony. But just as Ouida or Marie Corelli introduces the element of exaggeration for effect in the romance of "The Massarenes," or in "Wormwood," so the modern architect delights to give us startling contrasts by the introduction of features or treatments borrowed from very opposite sources, intended to surprise or shock the eye accustomed to the ordinary rules or platitudes of the art moralist. It is rather the overpowering sense of the inconsistency or exaggeration which is painted in too glaring colours that we deprecate. It may be too shocking, or "writ too large,"—the effect is to at once make us sensible of the imposition. Thus, in a crowded commercial street we see replicas of buildings intended for convents and retreats, quiet and broad or massive; on the other side a flaunting display of shop-front and plate glass. Both surprise us by their apparent insincerity. In a locality where stone is abundant, we are startled by a building in which ornamental brick and timber-work has been introduced which defy all sense of congruity. Or we see a building crowded with a profusion of orna-

ment for some very ordinary use, a palatial warehouse or shop, while the municipal building over the way is bare and meagre in the extreme. Exaggeration in architecture is really the loss of proportion between one part and another; the bringing into notice of a feature that has no proper meaning or conformity with the rest, a want of proportion between the ornamental and the plain, and a giving a prominence to any feature or quality which has little meaning or connection, are all illustrations. We see a design with all gables, or one with "bits" of details copied from sketch-books which has been called the "bib and tucker" stage of design, another rejoicing in pediments of ogee shape, a circular canopy porch on corbels, another revelling in colonnettes.

But of all kinds of exaggerations, few are more ridiculous than those which imitate the whims of leading designers. The "personal equation" is particularly powerful in these days. For example, the tastes of such men as Norman Shaw, George and Peto, Colcutt, Belcher, and many others have become strongly contagious. A brick detail from Norman Shaw, a piece of Free Renaissance from Colcutt, assumes an exaggerated position and meaning in Mr. Brown's or Mr. Jones's work, and the feature, in fact, becomes infectious. We get what is called "Colcuttica," or a superficial veneer of gable and plaster work without the redeeming qualities of the master; or it is a version Shaw, or the red-brick and white-sash fever; or the inevitable pediment of another leader of architectural fashion. The eccentricity is marked: it obtrudes itself where it is least expected; it is the hall-mark of Mr. So and So's design, just as we know the marginal signatures of engravers. There are certain very vulgar and significant examples of exaggerations or eccentricities. One is the flaunting, self-advertising shop-front, in which all the exaggerations of individual designers may be said to run riot at the expense of every moderation and virtue. There is the prodigious restaurant front, with its iron pillars and plate-glass, decorative adjuncts of stained glass, wrought-iron grilles, ornamental woodwork, and a host of fancy lamps, to which every modern decorative artist may be said to contribute. It is the polished granite or mahogany or glazed faience which is overdone, or the leaded window with its coloured glass designs or the brilliant cut plate that seems to obtrude itself, at the cost of everything else. Exaggeration seems one of the attractions of this class of buildings in the eyes of the public; but, like all unhealthy stimulants, it grows wearisome. Thus, the great vestibule with its ornamental painted faience, tile pavement, embossed ceiling, gilded metal work, and stained glass palls upon the imagination; the well-balanced and moderate design in keeping with the rest of the building is more satisfying. The elaborately modelled terracotta façade can be carried to an extreme, so can the polished and carved mahogany front and fittings. The gable epidemic is another instance of exaggeration. Go up Oxford-street, Charing Cross-road, or any of the new streets and roads that have been given over to the speculative builder, and one sees how this feature has been developed. Cadogan-square, Hans-place, the houses and "mansions" facing Battersea Park, are localities specially favoured. In many of the houses the gable is large and prominent, and has been made the chief feature. The most elaborate outline has been adopted, with every sort of scroll device and terminal. An importance has been given to the gable far in excess of the structural demand. The most elaborate examples have been imported from Germany and Belgium to surmount the most ordinary houses, and with the least pretence. The chimney-stack, with its mass of plain brickwork, is often exaggerated more

for artistic effect than for any use. Breaking through a roof of tile, it certainly gives a picturesque and homely appearance; but when we see it assuming the dimensions of a tower and overpowering the building, we naturally regard it as a whim. Another modern exaggeration is "half-timber" work—a kind of Speke Hall construction "gone mad"; the style, indeed, without the construction. At Folkestone and Eastbourne, at Broadstairs, along the Thames, above Richmond or Twickenham, we see this sort of exaggerated "stud" architecture, pretty and suggestive in its way, but only skin deep. We can learn what we mean by exaggeration when we compare this kind of excessive imitation with the real timber frame-work of Lancashire, Warwickshire, or Cheshire. Whether it is a piece of Palladianism, a *réchauffé* of Mediævalism, Tudor or "Queen Anne," or a peculiarity of an architectural *raconteur*, the practice we speak of has a baneful effect on our architecture, the more so as it departs from the motive of commonsense construction.

LIABILITY FOR ESTIMATES.

WHETHER an architect is liable for deficiency of his estimate has long been a disputed question. A case just decided at the Bristol Assizes, and reported in our last issue, appears to answer this question in the affirmative. Some brewers at Bristol wished to extend their premises at Newport, Mon., and engaged an architect of that town, who advised them as to the cost of a building to be erected at that place, which he estimated would be between £600 and £700, whereas the plaintiffs had to pay £1,163 17s. The plaintiff brewers sought to recover the difference. The defendant architect had a counter-claim for £56 for commission on the work. The builder agreed to build the house at a schedule of prices, and it was contended by the defendant's council that the schedule having been agreed to by the plaintiffs, they had simply to pay for the work actually executed. It was acknowledged by the defendant that he had made a mistake in pricing his rough estimate at 5d. per cubic foot instead of 7d. per foot, which would have worked out at £900, and he discovered the first mistake of £200 before the work was actually in hand; but as to the second mistake of the same amount, he did not admit it, as it was due to "extras." The defendant pleaded the only contract was to erect a house according to schedule prices. In the end his lordship awarded £35 to defendant, giving a verdict for plaintiffs at £115 and costs, and he thought that the defendant was negligent in not informing the plaintiffs of the increased expenditure. So far the facts as reported.

The question that most concerns the profession is whether the estimate of an architect should be reasonably near the actual cost, and whether it is his duty to inform his client of any deficiency in his estimate, or mistake in the estimate he had made. The first point appears of little doubt; but the ruling of the Court has not decided any distinct issue from which we may infer anything definite. In one of the recorded cases ("Nelson v. Spooner"), an architect brought an action against his client for not carrying out his design which had been rejected on the ground that the work could not be done for the estimate. The judge before whom the case was tried laid down certain questions or points. (1) Was it an express condition that the work should be completed for the estimated sum? If not (2), Whether there is an implied condition that the work should be capable of being executed for a sum reasonably near the estimated sum? And if so (3), Whether plaintiff's estimate was so reasonably near, that the defendant ought to have employed him? No decision was come to. When there is no express condition

under the first head—and there seldom is—there does appear to be an implied condition that the architect's estimate should not exceed his figures by a certain limit. It is reasonable that when an architect gives an approximate estimate, it should be within a certain percentage of the actual cost, and this approximation should be made known. Thus, as to the third point—namely, what should be considered “reasonably near”—it ought not to be difficult to name a certain limit; in fact, if the client makes known his intention of holding the architect strictly to his estimate, these disagreements could not arise. But the real fact is no such definite estimate is ever given by an experienced architect, or made a matter of agreement between building owner and architect;—a sum is roughly guessed at, and the architect thinks no more about it; a tender is sent in which generally exceeds the sum stated by perhaps from 10 to 30 per cent., and the work is commenced. Until the quantities are taken off, it is impossible to give an estimate, and no architect should bind himself to any sum arrived at by cubing, as a mistake of 1d. or 2d. a foot may seriously affect the amount. From the report of the case decided the other day, nothing very definite has been arrived at. The evidence is not very clear as to whether the estimate was to be an express condition; but it would certainly not appear so, as the builder's price was to be according to a schedule. It is impossible to say what the owner expected, or what the architect thought to be his duty in the matter, and any decision must depend on these circumstances. The question of negligence in not informing the employer of any mistake in the estimate may certainly arise. Anyhow, if an architect has express instructions about cost, and he is careless in the estimate, or fails to tell his client of any mistake or discrepancy, he is to blame; though we do not see the use of a schedule if a certain sum is to be made binding. If the contract was to build according to a schedule agreed to by the plaintiffs, then they were simply paying for the amount of work actually put in the building, and cannot complain. After all, the architect's liability for any deficiency in his estimate can only arise when there is an express condition that the building is to be completed for the estimated sum. And it seems to us if there is no such agreement, and the architect gives a rough estimate by cubing, the client can hardly make him responsible, unless the actual cost far exceeds the reasonable anticipation of the employer. When will architects learn the wisdom of not binding themselves down to a rough estimate of cost?

A professional man who is sensible of his own reputation and correctness of judgement will very seldom commit himself to any estimate that is not based on quantities; and if these are prepared, we fail to see why any architect should state a sum as at all binding, or lead his client to suppose that he ought to obtain a tender within a reasonable limit. Sometimes, we know, these rough estimates are given and accepted with an amount of credulity that is astonishing; but they generally lead to trouble or disappointment. More independent is the architect who refuses to guarantee any amount, and will only advise after the tenders are submitted on properly prepared data.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXV.

THE building up of booms, struts, and ties into lattice girders requires details of jointing as diversified as the forms of the elementary parts themselves; it is often more difficult to decide on the best form of joint than on that of the elements. From this point of view the American pin-connected trusses would appear to possess an element of simplicity lacking in ours, because the shearing strength of a single pin is

more readily estimated than the strains on a number of rivets distributed over a large area, in respect of which much uncertainty exists and on which practice is not uniform. But ample margin of strength can be, and is, generally provided in large riveted joints as a compensation against possible indifferent work and corrosion, so that fracture of such joints is rare.

The lap joints used by boilermakers are rarely employed in girder work, the butt joint, with

FIG. 146.

single or double covering strips, being more convenient and safer; double strips are generally used, except in cases in which two webs are adjacent, when a single cover on each often suffices. The objection to the use of a single cover is that the plates and cover are liable to bend sideways at the joint, because of the unsymmetrical arrangement, and because the rivets are only in single shear—that is, they can be shorn off in one plane only. When double cover-strips are used the strain occurs only along the central axis of the plate, and no bending can take place, while the rivets, if shorn at all, must be shorn in two planes, and must possess in theory just twice the strength of rivets in single shear only. The thickness of single covering plates is usually the same as that of the plates, that of double covering plates not less than half, and, preferably, two-thirds; the width of a covering plate is equal to that of the width of the plates to be united.

The strength of a butt joint is represented by that of one-half only of the total number of rivets and plate-section—that is, the rivets and plate on one side of the joint must be taken, and not the total number of rivets as in a lap joint.

The net plate section is, for purposes of

FIG. 147.

strength, that which is left between and outside the rivets in one row only. The effective rivet section is that of the whole of the rivets on one-half of a joint, provided the strain is distributed equally between them all, as is assumed to be the case; rivet section is equal to the diameter of a rivet, plus thickness of plate, plus total number of rivets in a lap joint, or on one side of the joint in a butt joint.

The strength of a joint to resist compression is taken as that of the strength of the rivets to resist shearing stress, taking no account of the abutment of the end of the strut; it is considered that the fitting of the latter may not be good, so

throwing all the strain upon the rivets. The strength of a joint to resist tension is according to the sectional area of the net thickness of plate across the centre of a single row of rivets, or as the shearing strength of all the rivets on one side of the joint in the case of a butt joint, or of all the rivets in the case of a lap joint; net thickness of plate does not include the thickness of covering plates, which are not reckoned. In a properly proportioned joint the aim is to preserve with some approximation equal strength in net plate section and in total rivet section.

The best arrangement of rivets in a joint depends on many conditions, such as on the width of bar and cover-plate available; the nature of the joint, whether with single or double covering plates, and the relative strength of plate and rivet section. When a number of rivets have to be used, a wide distribution over a large area in two or three, or even more rows, is generally preferable to their location in a single row; it diminishes risk of bending of plates when single covers only are used; it permits the use of narrow covering plates when narrow bars are in question and conduces to rigidity. In Fig. 146, the rivets arranged in two rows only abstract so much from the plate section that it would be better to lengthen the cover plate, and double the number of rows as in Fig. 147; the total rivet section would then be retained as strong as in Fig. 146, while the plate section would be increased by the area of the four rivet sections removed to the hinder rows. Fig. 148 shows an arrangement in which a large plate section is retained with a large rivet section. The strength of the rivets in the lower single cover-joint A can further be doubled by using two covers, as at B; by such variations as these the conditions of strength

FIG. 148.

required in different types of joints can be obtained.

In reference to diameters of rivets and their centres proportions are fixed by long practice, in order mainly to guard against risk of shearing, and by some engineers against a crippling or crushing action which may occur between the rivets and plates. It is not necessary to discuss reasons for the fixing of these proportions of rivets to plates; the proportions of centres differ very widely. The only rule is that a pitch of centres between adjacent rows equal to two diameters of the rivets used is the minimum permissible; the distance to the end of a cover-plate is not less than about 1.2 diameters, the distance to the side edges of a plate not less than half the clear distance between two holes; this prevents risk of the plate fracturing outside the rivets, and confines the stresses to simple shearing of the rivets or tension of the plate, according as each is calculated for. The pitch of rivets in line will vary from about 2½ in. to 6 in., the diameters averaging from ½ in. to 1 in.; roughly speaking, for plates under ½ in. thick the diameter of the rivets equals twice the thickness, for plates over ½ in. about 1½ times the thickness.

The frictional resistance of riveted plates, due to the grip of the rivets, is not generally reckoned on as an element of strength, notwithstanding that it is high in new and good work. It is considered that, though of some permanent value in quiescent loading, the frictional resistance is liable to become impaired by the long-continued vibration of high loads. As a set-off against any gain due to friction is the frequent injury done to the plates by the punching of rivet-holes, which is often of a serious character, and which may not be wholly removed by reaming if the latter is not equal all round and sufficient in quantity. There is also the cutting action of

the sharp edges of drilled holes when the arris is not sufficiently removed. The whole subject is one which is involved in considerable obscurity, experiments not having given very uniform results, and the sound practice of leading engineers is therefore the best guide.

Specifications are often, and properly, stringent

Fig. 149.

about the way in which riveting is to be performed; loose-fitting rivets, and rivets with cracked heads or tails, must be cut out and replaced by others. It is necessary to allow some slight clearance between the rivet and its hole, because of the expansion of the former at a white heat; this cannot be less than about $\frac{1}{16}$ in., and should not be more than $\frac{1}{8}$ in. in a large rivet; the limit is sometimes fixed at $\frac{1}{16}$ in. This slackness is made up in work properly performed by the end pressure of the rivet swelling it out to fill the hole. Machine riveting exercises this pressure more efficiently than hand riveting, and therefore many specifications now insist on riveting being done by machine; obviously, when a rivet-tail is closed by hand-hammers, the closing action

Fig. 150.

cannot extend far from the tail; but, when a machine is used, the endlong pressure acts throughout the whole length, forcing the rivet to fill the hole completely.

The question of drilling or of punching is often settled by specifications; but it is frequently left open to the contractor's discretion, provided that the holes, however formed, are satisfactory to the inspector; there is much more made of the superiority of drilling over punching than is borne out by experience. It is the fashion to drill now; but, unless holes are drilled in place, and the keen edges removed before the insertion of the rivets, drilling has no advantage over punched

Fig. 151.

and reamed holes: it is just a question of workmanship. Holes drilled separately may have to be pulled into line by drifting, so distressing the material locally, and edges left keen are liable to injure the rivets; on the contrary, if a hole is punched, the metal is distressed only for $\frac{1}{16}$ in., or $\frac{1}{8}$ in. in the intermediate vicinity, and when this is reamed out the net plate section is left uninjured. Another point on which inspection is

keen is the preservation of the specified width between the outer rivet-holes and the edges of the plate; if these dimensions are reduced, the risk of opening-out of the plate from the rivets to the edge is seriously increased.

Gussets are used to give large shearing and bearing area for the rivets; and also in order to avoid the increasing the depth of the flange-webs along the entire length when large rivet sections are required. Gussets are sometimes doubled, embracing a tie or strut on opposite faces to put rivets into double shear; they are used as covering strips when two or more joints are adjacent; and they render connections rigid. When a girder is of long span, the booms have to be made so deep that there is often ample depth in the webs for the riveting without the addition of gussets; in those portions of a girder where

Fig. 152.

tensile stresses are greatest, as at the end ties, the gussets have to be increased in proportion to the increased strength of the ties, in order to permit of the insertion of a larger number of rivets.

Fig. 149 illustrates a typical joint, showing the use and value of a gusset A; this is riveted between two angles, which form the bottom flange of a braced girder. It is necessary, we suppose, to have a total rivet section of three rivets in each bracing; the width of the angle-bracings, B B, is not sufficient to allow of placing three rivets in line, because that would leave the plate section too weak in the tension members. Three rivets placed one behind another will leave sufficient net plate section, and the strain on the rivets may be assumed, with good workmanship, to be equally apportioned between the three; but the

Fig. 153.

angle-iron flanges are not deep enough to receive the three rivets in series, though strong enough for their own proper duty. The gusset fulfils the required conditions, and in its absence the depth of the angles would have to be increased, or a continuous web would have to be riveted between the angles, of a depth equal to that of the gusset.

Fig. 150 illustrates a typical gusset-fastening for post and tension members to the bottom or tension boom of a girder; the latter is composed of flats, and the tension members A are flats, the posts B are of plate and angle to joist or H section. At *aa* the maximum net section of plate possible is secured, and the total rivet section is obtained without weakening the net-plate section on *aa*, and fracture of the plate would occur, if at all, at *aaa*.

Figs. 151-153 illustrate rather elaborate and very strong gusseting, in which many of the rivets are in double shear. Fig. 151 shows the attachment of the centre or main post for one of the bow-string girders of a swing-bridge to the boom, and two ties, and Fig. 152 the attachment of a single tie and strut to the boom, while Fig. 153 shows in section the top and bottom booms, which are double-webbed, stiffened at intervals with angle-iron diaphragms.

In Fig. 151, A, the centre post, is a double-webbed box-pillar, built of plates and angles; B B are ties, composed of plates and angles, arranged in a joist or H section. The widths of each, that is, perpendicular to the plane of the paper, are equal; the joint is made by abutting the post A bodily against the edges of the boom C, and by cutting the edges of the flange-plates of B B to abut against the edges of both A and C, leaving the webs and angles to pass within the web-plates of C; the single gusset-plate D then covers over the whole joint area, a single plate being riveted on each side of the girder. In Fig. 152 the same type of joint is used for the tie and vertical struts, the struts A abutting against the booms, and the flange-plates of the ties B being cut away, leaving the web and angles to pass between the webs of the boom, a cover-plate, D, making the joint on each side. Gusset joints of this type are typical of large numbers made. J. H.

MAYORAL CHAIN FOR ARUNDEL.

THE Duke of Norfolk has lately presented a gold chain to the Corporation of Arundel, to be worn by the Mayor in commemoration of the Diamond Jubilee of her Majesty the Queen. The chain is of 18-carat gold, and is adorned with alternate suns and white roses; in front is a large red rose, with a white one in the middle, and dependent therefrom a badge with the arms of the town of Arundel—argent, a swallow volant in bend sinister sable. The badge is surrounded by oak-leaves and acorns, a device of the Fitzalans, earls of Arundel. At intermediate intervals are four enamelled escutcheons, bearing the arms of England, Scotland, Wales, and Ireland. At the back is an enamelled quatrefoil, with the insignia of the noble donor of the mayoral chain, his Grace the Duke of Norfolk, E.M., K.G. It was designed by Mr. C. A. Buckler, Surrey Herald Extraordinary of the College of Arms, and executed by Messrs. Hardman, Powell, and Co., of London and Birmingham.

STEEL SKELETON BUILDINGS, NEW YORK.

AN article on "Architectural Relations of the Steel Skeleton Building," by F. H. Kimball, in the *Engineering Magazine*, traces the development of the tall building and the possibilities of the future. He says, "While the beauty of stone and brick in colour and texture is not to be questioned, conditions may arise which demand a radical departure from the traditions that dictate their use. In place of stone or brick, why not use iron or steel plates, or a composition plate, bolted or riveted to the steel frame? This could not be considered a return to the cast-iron imitation of stone masonry which prevailed 20 years ago. A more rational and natural use of metal might be devised which would not have the elements of a cast-iron front." As Mr. Kimball says, in the designing of one of these buildings the architect has more to think about than under the older systems. The external design and interior arrangement must be worked up together, the sources of lighting by courts in the centre or on one side, the position of the lifts or elevators. The location of the supports is another important point; any equidistant distribution may be impossible, if large halls and rooms are to be considered. Sometimes, as in the Manhattan Life Building, it is desirable to bury the columns in the divisional walls, and every story has to be considered through which they pass. Economy has also to be thought of in the spacing of the columns. If too far apart, increased weight of metal is required in the supporting girders and columns, and heavier floor-beams are necessary, besides greater concentrated loads at the foundations. Another important question is the location and depth of girders supporting the floors; also the position of outer-wall columns, which must be covered up in the piers or come in the wall spaces, and these have to be regulated by the elevation. The author illustrates an example of bracing in the first two stories of the Empire Building, Broadway. The author says: "In the placing of outside wall-supporting girders in the case of a stone front, it is desirable to locate them where cornices or band-courses occur, so that the heavy stone forming these features may run through the wall and be borne on the girders, thus acting as corbels on which the walls above may be carried up to the next horizontal line of girders. This system permits the erection of

MAYORAL CHAIN FOR THE BOROUGH OF ARUNDEL.

any part of a front independently of other parts if deemed advisable." The author refers to the protection of the structural frame irabedded in the outside walls. Some place the columns entirely within the wall, which involves heavy brackets from the columns to support the girders

carrying the walls, besides eccentric loading. Generally the columns are placed so that they shall have the protection of from 8in. to 12in. of masonry between them and outer air, and the metal is treated with a moisture-resisting paint or composition. The best form of column is that

which offers the minimum exposure to the direction of the moisture and wind. For example, an open column through which masonry may be built encasing the metal, the webs being placed at right angles to the walls, is the best method to prevent them from injury from without. The

author also refers to the importance of an adequate protection by burned-clay blocking of the skeleton framework to protect columns from fire, the requirements of pipe lines carried up in the columns, which all add to the size of the sectional area of the supports, and to the difficulty of the architect. The author illustrates his paper by plans and views of the Manhattan Life Building, New York, the Corn Exchange Bank, the Bowling Green Building, the Commercial Cable Building, the Gillender Building, the St. Paul's Building, Empire Building now being erected, a colossal structure of 20 stories, with three exposed fronts.

THE NEW AMERICAN TARIFF.

THE following are the portions of the new American Tariff Act, which came into force on Saturday afternoon, affecting the brick, clay, cement, metal, and slate industries, and which are grouped together under schedules B and C. It will be noticed that the duties are largely increased on almost all items.

EARTH, EARTHENWARE, AND GLASSWARE.—BRICK AND TILE.

Firebrick, weighing not more than 10lb. each, not glazed, enamelled, ornamented, or decorated in any manner, 1dol. 25c. per ton (against Magnesic firebrick 1dol. per ton), glazed, enamelled, ornamented, or decorated, 45 per cent. ad val. Brick, other than firebrick, not glazed, enamelled, painted, vitrified, ornamented, or decorated in any manner, 25 per cent. ad val. (against same); if glazed, enamelled, painted, vitrified, ornamented, or decorated in any manner, 45 per cent. ad val. (against 30 per cent.)

Tiles, plain, unglazed, floor, one colour, exceeding 2sq.in. in size, 4c. per square foot; glazed, encaustic, ceramic, mosaic, vitrified, semi-vitrified, flint, spar, embossed, enamelled, ornamented, hand-painted, gold decorated, and all other earthenware tiles, valued at not exceeding 40c. per square foot, 8c. per square foot; exceeding 40c. per square foot, 10c. per square foot, and 25 per cent. ad val. (against tiles, plain, not glazed, ornamented, painted, enamelled, vitrified, or decorated, 25 per cent. ad val.); ornamented, glazed, painted, enamelled, vitrified, or decorated, and encaustic, 40 per cent. ad val.

CEMENT, LIME, AND PLASTER.

Roman, Portland, and other hydraulic cement in barrels, sacks, or other packages, 8c. per 100lb., including weight of barrel or package (against same); in bulk 7c. per 100lb. (against same); other cement, 20 per cent. ad val. (against 10 per cent.)

Lime, 5c. per 100lb., including weight of barrel or package (against same).

Plaster, rock, or gypsum, crude, 50c. per ton, ground or calcined, 2dol. 25c. per ton; pearl hardening for paper-makers' use, 20 per cent. ad val. (against plaster of Paris or gypsum, ground, 1dol. per ton; calcined, 1dol. 25c.)

Pumice-stone, wholly or partially manufactured, 6dol. per ton; unmanufactured, 15 per cent. ad val. (against free).

CLAYS OR EARTHS.

Clays or earths, unwrought or unmanufactured, not specially provided for in this Act, 1dol. per ton (against same); wrought or manufactured, not specially provided for in this Act, 2dol. 50c. per ton (against 2dol.); China clay or kaolin, 3dol. per ton; limestone rock asphalt containing not more than 15 per cent. bitumen, 50c. per ton; asphaltum and bitumen not specially provided for in this Act, crude, if not dried, or otherwise advanced in any manner, 1dol. 50c. per ton (against free); if dried or otherwise advanced in any manner, 3dol. per ton; bauxite or beauxite, crude, not refined or otherwise advanced in condition from its natural state, 1dol. per ton (against beauxite free); fullers' earth, unwrought and unmanufactured, 1dol. 50c. per ton; wrought or manufactured, 3dol. per ton.

STONE.

Freestone, granite, sandstone, limestone, and other building or monumental stone, except marble and onyx, unmanufactured or undressed, not specially provided for in this Act, 14c. per cubic foot (agst 7c.)

Freestone, granite, sandstone, limestone, and other building or monumental stone, except marble and onyx, not specially provided for in this Act, hewn, dressed, or polished, 50 per cent. ad val. (against 30 per cent.)

SLATE.

Slates, slate chimneypieces, mantels, slabs for tables, roofing slates, and all other manufactures of slate, not specially provided for in this Act, 20 per cent. ad val. (against same).

PAINTS AND COLOURS.

All paints, colours, pigments, lakes, crayons, smalts, frostings, whether crude, or dry, or mixed, or ground with water or oil, or solutions other than oil not otherwise specially provided for in this Act, 30 per cent. ad val.; and all paints, colours, pigments, commonly known as artists' paints, colours, whether in tubes, pans, cakes, or other forms, 30 per cent. ad val. (against 25 per cent. ad val.)

IRON AND STEEL.

Bar iron, square iron, rolled or hammered, comprising flats, not less than 1in. wide nor less than $\frac{3}{16}$ in. thick, round iron not less than $\frac{1}{8}$ in. in diameter, 6-10c. per lb. (against same).

Round iron, in coils or rods, less than $\frac{1}{8}$ in. in diameter, and bars or shapes of rolled or hammered iron not specially provided for in this Act, 8-10c. per lb. (against 8-10c.); provided that all iron in slabs, blooms, loops, or other forms less finished than iron in bars, and more advanced than pig-iron, except castings, shall be subject to a duty of 4-10c. per lb. Provided, further, that all iron bars, blooms, billets, or sizes or shapes of any kind, in the manufacture of which charcoal is used as fuel, shall be subject to a duty of not less than 12dol. per ton (against same).

Beams, girders, joists, angles, channels, car truck channels, T.T. columns and posts, or parts or sections of columns and posts, deck and bulk beams, and building forms, together with all other structural shapes of iron or steel, whether plain or punched, or fitted for use, 5-10c. per lb. (against 6-10c.)

Boiler or other plate iron or steel, not thinner than number 10 wire-gauge, sheared or un-sheared, and skelp iron or steel sheared or rolled in grooves, valued at 1c. per pound or less, 5-10c. per pound (against same) valued above 1c. and not above 2c. per pound, 6-10c. per pound (against valued above 1c. and not above 1 $\frac{1}{2}$ c., 6-10c. per pound), valued above 2c. and not above 4c. per pound, 1c. per pound (against valued above 1 $\frac{1}{2}$ c. and not above 4c. per pound, 30 per cent. ad val.); valued at over 4c. per pound, 25 per cent. ad val. (against same). Provided that all sheets or plates of iron or steel thinner than number 10 wire-gauge shall pay duty as iron or steel sheets.

Hoop, band, or scroll iron or steel, not otherwise provided in this Act, valued at 3c. per pound or less, 8in. or less in width and less than $\frac{3}{16}$ in. thick, and not than number 10-wire gauge, 5-10c. per pound; thinner than number 10 wire-gauge and not thinner than number 20 wire-gauge, 6-10c. per pound; thinner than number 20 wire-gauge, 8-10c. per pound (against 30 per cent. ad val.) Provided that barrel hoops of iron or steel, and hoop or band iron, or hoop or band steel, flared, splayed or punched, with or without buckles or fastenings, shall pay 1-10c. per pound more duty than that imposed on the hoop or band iron or steel from which they are made. Steel bands or strips, untempered, suitable for making band saws, 3c. per pound and 20 per cent. ad val.; if tempered, or tempered and polished, 6c. per pound, and 20 per cent. ad val.

Hoop or band iron or hoop or band steel cut to lengths or wholly or partly manufactured into hoops or ties, coated or not coated with paint or any other preparation with or without buckles, fastenings for baling cotton, or any other commodity, 5-10c. per pound.

Railway bars made of iron or steel, and railway bars made in part of steel, T rails, and punched iron or steel flat rails, 7-20c. per pound (against 7-20c.). Railway fish plates or splice bars, made of iron or steel, 4-10c. per pound.

Sheets of iron or steel, common or black, of whatever dimension, and skelp iron or steel, valued at 3c. per pound or less, thinner than No. 10 and not thinner than No. 20 wire-gauge, 7-10c. per pound; thinner than No. 20 wire gauge, and not thinner than No. 25 wire-gauge, 8-10c. per pound; thinner than No. 25 wire-gauge and not thinner than No. 32 wire-gauge, 1-1-10c. per pound (against same, up to and including inch 25 wire-gauge); thinner than No. 32 wire-gauge, 1-2-10c. per pound; corrugated or crimped, 1-1-10c. per pound (against same). Provided that all sheets of common or black iron or steel not

thinner than No. 10 wire-gauge shall pay duty as plate iron or plate steel (against same).

Cast-iron pipe of every description, 4-10c. per pound (against 6-10c.)

WIRE.

Wire rods, rivet, screw, fence, and other iron or steel wire rods, whether round, oval, flat, or square, or in any other shape, and nail rods, in coils or otherwise, valued at 4c. or less per pound, 4-10c. per pound; valued over 4c. per pound, $\frac{3}{4}$ c. per pound (against same). Provided, that all round iron or steel rods smaller than No. 6 wire gauge shall be classed and dutiable as wire (against same). Provided further, that all iron or steel wire rods which have been tempered or treated in any manner or partly manufactured, shall pay an additional duty of $\frac{3}{4}$ c. per pound. Round iron or steel wire, not smaller than No. 13 wire gauge, 1 $\frac{1}{2}$ c. per pound; smaller than No. 13 and not smaller than No. 16 wire-gauge 1 $\frac{3}{4}$ c. per pound (against same); smaller than No. 16 wire gauge 2c. per pound (against same); provided that all the foregoing valued at more than 5c. per pound, shall pay 40 per cent. ad val.

NAILS, SPIKES, AND TACKS.

Cut nails and cut spikes of iron or steel, 6-10c. per pound (against 22 $\frac{1}{2}$ per cent. ad val.).

Horseshoe nails, hob nails, and all other wrought iron or steel nails not specially provided for in this Act, 2 $\frac{1}{2}$ c. per pound (against 30 per cent. ad val.)

Wire nails made of wrought iron or steel, not less than 1in. in length, and not lighter than No. 16 wire-gauge, $\frac{3}{4}$ cent per pound; less than 1in. in length, and lighter than No. 16 wire gauge, 1 cent per pound (against wire nails made of wrought iron or steel, 25 per cent. ad val.)

Spikes, nuts, and washers, and horse, mule, or of shoes of wrought iron or steel, 1c. per pound (against 25 per cent. ad val.)

Cut tacks, brads, or sprigs, not exceeding 16oz. to the 1,000, 1 $\frac{1}{4}$ c. per 1,000; exceeding 16oz. to the 1,000, 1 $\frac{3}{4}$ c. per pound (against all kinds 25 per cent. ad val.)

LEAD.

Lead-bearing ore of all kinds, 1 $\frac{3}{4}$ c. per pound on the lead contained therein.

Lead dross, lead bullion, or base bullion, lead in pigs and bars, lead in any form not specially provided for in this Act, old refuse lead run into blocks and bars, and old scrap lead fit only to be remanufactured, all the foregoing, 2 $\frac{3}{4}$ c. per pound; lead in sheets, pipe, shot, glaziers' lead, and lead wire, 2 $\frac{1}{2}$ c. per pound (against lead ore and lead dross, $\frac{3}{4}$ c. per pound; lead in pigs and bars, and old scrap lead fit only to be remanufactured, 1c. per pound; lead in sheets, pipes, &c., and lead wire, 1 $\frac{1}{4}$ c. per pound.)

ZINC.

Zinc in blocks or pigs, 1 $\frac{3}{4}$ c. per pound (against 1c. per pound); in sheets, 2c. per pound (against 1 $\frac{1}{4}$ c.); old and worn outfit only to be remanufactured, 1c. per pound (against $\frac{3}{4}$ c.).

BUILDERS' BENEVOLENT INSTITUTION.

ANNUAL MEETING.

THE fiftieth annual meeting of the Builders' Benevolent Institution was held on Thursday, July 22, at the offices, 35, Southampton-row, Bloomsbury. Mr. W. Scrivener, vice-president, occupied the chair, supported by Messrs. Thos. Stirling, Thos. Hall, E. S. Rider, C. Ansell, F. Foxley, E. V. New, and others.

Major Bruton, the secretary, read the annual report, which stated that the income during the past year had been sufficient for the maintenance of the pensioners, and, believing it would meet with the approval of the subscribers, the committee admitted the whole of the thirteen eligible candidates to participate in the benefits of the Institution. Although the large increase in the number of the pensioners entailed much responsibility, the committee were of opinion that the necessary income would be forthcoming to meet the increased expenditure, particularly as the advanced age of the applicants required immediate relief. Much of the success of the year had been owing to the energy of the president, Mr. Henry Holloway, to whom the committee offered their hearty acknowledgments and gratitude. The subscribers were asked to kindly bear in mind that the present was the fiftieth year since the foundation of the charity—indeed, its jubilee—so that a largely increased contribution would be

hoped for on so special an event. The committee desired to offer their thanks to the stewards of the annual dinner, and to the hon. auditors. Much regret was felt at the loss by death of Sir Wm. Lawrence and Sir James Clarke Lawrence, Bart., both past-presidents of the Institution, the latter being also a trustee. The committee announced that Mr. Charles Wall would be the President for the ensuing year, and that the annual dinner would take place in Carpenters' Hall on Thursday, Nov. 25.

On the motion of Mr. New, seconded by Mr. Foxley, the receipts and balance sheet were unanimously agreed to.

Mr. T. Stirling next moved: "That the committee be empowered to give temporary relief in cases of urgency to selected, but unsuccessful, candidates for the charity to an amount of not exceeding £5 to any one candidate." At the close of the elections there had often been a good deal of disappointment among the unsuccessful candidates, and it had been considered that this would be a generous course to pursue.

Mr. New seconded the resolution, which was agreed to *nem com.*

On the motion of Mr. Hall, seconded by Mr. Stirling, a cordial vote of thanks was passed to Mr. Henry Holloway for his kind support and services during his year of office.

Thanks were also given to the trustees, to the treasurer, Mr. Geo. Plucknett, J.P., and to the committee, the retiring members being re-appointed with the addition of Mr. Henry Holloway. Thanks were also passed to the auditors.

Mr. Stirling proposed Mr. Charles Wall as president for the ensuing year, which was seconded by Mr. Hall, and carried by acclamation.

A vote of thanks to the Chairman closed the proceedings.

NOTES ON THE PAINTED GLASS IN CANTERBURY CATHEDRAL.*

VISITORS to Canterbury Cathedral will have often been puzzled over the old stained-glass windows, which contain some of the finest 13th-century glass. Many of these windows throw a side-light on the legends and beliefs of the Middle Ages, as, for example, they illustrate the miraculous interventions of Archbishop Becket. The Very Rev. F. W. Farrar, Dean of Canterbury, writes a preface to these Notes, prepared with considerable study and labour. The main object of the author of these Notes has been to give an account of the changes which have taken place in the arrangement of the scattered fragments of the old painted glass, and to show their continuity. There are twenty-seven plates and drawings in outline of the windows, by which means the whole series are recorded, and any individual subject can be found out. Beginning with the clerestory, thirty-three out of forty-nine windows are said to be copies by the late George Austin of the original glass. The subjects represent the ancestry of Our Lord, beginning on the north side of choir with the Almighty and Adam, passing round both transepts, and ending with Our Lord and the Blessed Virgin on the south side. Each window is subdivided into two subjects, one above the other. Mr. Westlake, who has overlooked these notes, thinks that these clerestory windows were the oldest in the cathedral, those still remaining being a little after 1200, and he points out a close resemblance of these windows to those in the lancet windows at Chartres and in the Abbey of St. Remi, Rheims, and thinks that the designs originated at Chartres. Detailed notes are given of each of these windows, derived from several sources, which are given. The north transept of choir contains subjects of the "Conversion of the Heathen," "The Church and Noe's Sons," "Marriage in Cana," and "The Calling of Nathaniel." Then follow descriptions of those in the north triforium, which include "The Siege of Canterbury," "The Taking of St. Alphege," and "The Murder of the Monks." The south triforium and the windows in Trinity Chapel are next described. The Latin inscriptions are given in large capitals, and the subjects are numbered and correspond with the "plans" in outline of each window, of which there are twenty-two given. It would be impossible to give in any detail the subjects of these windows, which occupy over

70 pages. Among the authorities quoted for the descriptions are "The Antiquities of Canterbury," by W. Somner, 1640; Culmer's "Cathedral News from Canterbury," 1644; Dart's "History and Antiquities of the Cathedral Church"; Edward Hasted's "History of Kent," 1783-1790; W. Gostling's "A Walk In and About the City of Canterbury," 1825; works by N. H. J. Westlake, F.S.A.; "Early Glass in Canterbury," by W. J. Loftie, B.A., &c. The proceeds of the sale of this interesting work are to be given to the Cathedral Restoration Fund.

DAMS BUILT OF GRAVEL.

IT is a very common circumstance for contractors and builders, when carrying out drainage or works of a somewhat similar character, where more or less water has to be encountered, to be obliged to construct small temporary dams for the protection of their operations. Even when only of very moderate dimensions, these "false works," as our American friends term them, usually take the expensive form of main piles, sheeting piles, and 2in. or 3in. stout timber planking, according to the height of the dam, and that of the water or of the ground to be maintained at the proper level. When the location does not allow of wooden piles being driven into the substratum, then a greater expense must be incurred in the employment of some description of caisson. Both of these methods are costly and tedious, not merely in their construction, but equally so in their subsequent removal or demolition. A far more economical mode of building dams when the head of water is comparatively small has been successfully employed by an engineer of Les Ponts et Chaussées in the carrying out of certain works attending the canalisation of the river Meuse. The height of water to be retained at a constant level was about 10ft., and the dams were built of coarsely-rounded gravel, varying from 1½in. to 4in. in diameter, obtained in the present instance from the bed of the Meuse by a very primitive and simple process of dredging. All that was required to be done was to tip the gravel carefully into the water over the site of the intended dam until it formed a bank, which generally assumed a side slope with a somewhat stiffer inclination than 45°. In a few days the dam, under the pressure of its own weight, comes down "to its bearings," and the slope on the external side is rendered thoroughly watertight, by spreading over it a tolerably thick layer of tan.

Many of the dams constructed in this novel manner were given a top width of 3ft. 3in. at a level of 3ft. above the surface of the water. The tan was laid on either from a boat or from barrows run along a temporary staging. Whichever plan was adopted, the great point aimed at was a perfectly uniform distribution of the staunching layer over the whole surface of the slope, for which purpose a particular kind of tool was invented. It is evident that a dam can be built in this manner both cheaply and expeditiously, and in situations which practically forbid the employment of any other but the most expensive sorts; it also possesses the advantage, by no means unimportant one, of being very easily removed after having performed its duty. There are no piles to be drawn, or, what is always a troublesome operation, cut off level with the ground below water. Neither is there any raising or breaking up of iron caissons to be undertaken, attended with usually the abandonment of the lowest two or three rings in the bed of the water channel; again, the material itself can nearly always be obtained, either on the site of the dam or in its near neighbourhood. Earthy materials are not recommended for the construction of these dams, and, while they may be built quickly, they should not be built hurriedly.

T. C.

BASEMENT FLOORS FOR MACHINE SHOPS.*

By PROF. JOHN E. SWEET.

TO fix one's ideas in treating this topic, let it be assumed that the ground to be floored is both solid and damp. With the solid ground only such a depth of filling is necessary as that required to distribute a concentrated load over large enough area, so that a hole will not be punched through what constitutes the floor. Concrete, if of the best quality, may be as good as anything, and the necessary thickness would depend on the weight of the load which it had to

support. In the writer's opinion a layer of thin flat stone, or two layers, bedded in concrete, and then a thin coating of concrete to give the full depth of, say, 6in., is better than 6in. of concrete, however good.

To cut off the moisture which is to be expected a coat of asphalt is best. Quicklime would be effectual, but with an unmatched floor the lime would sift through the cracks. The writer believes that a layer of 2in. plank is better than scantlings buried in the cement, as it better distributes the load, and joints in the top floor can come anywhere. We have determined by experience that the expected in this case does not happen; the floor does not spring up and down. The top flooring is best of only ¾in. stuff, 5½in. or less in width. When the thin top floor is worn through in places and needs repairing, the hole or depression is only ¾in. deep, whereas with thicker top flooring it is deeper.

Were we again to lay a floor we would cut all the top flooring into 4ft. lengths, to facilitate repairing, breaking joints every course.

At the works of John Lang and Son, of Johnstown, Scotland, their shop floor is wholly of iron chips, and is a solid, fairly good floor. Not as clean as a wood floor, but one that would answer well in a basement. The cost of such a floor would depend on the market value of chips. It is cheap to put down, and the night watchman can keep it in repair.

The above speculative consideration of the subject is presented for the express purpose of having those who have had experience give the facts, which, as usual, are more likely than not to upset the theory. What is the best construction for the basement floors of machine shops?

POSSIBLE LEAD-POISONING.

A REMARKABLE series of cases is quoted by Mr. A. W. Blyth in his monthly sanitary report to the parish of Marylebone, which, according to the St. Mary's Hospital medical authorities suggest lead-poisoning. They have occurred in a house situated in a mews in the parish. The living rooms in question are situated over stables, and the drinking cistern is in a loft. On examination the water supply was found excessively foul; but the writer could only discover one-tenth of a grain of lead, with a trace of copper and some iron as mineral constituents of the water. Hence, if the cases were really produced by lead, the origin must be in some other article of food or drink. It is quite a common thing to find a tenth of a grain of lead per gallon in water passing through lead pipes, and such water does not appear to produce the acute poisoning such as these cases would indicate.

THE DENUDATION AND RECOVERY OF FARM LANDS.

ONE of the most useful of the farmers' bulletins issued under the administration of the present Secretary of the United States Department of Agriculture is that entitled "Washed Soils: How to Prevent and Reclaim Them." We reproduce in this impression three illustrations which accompany the paper, showing the effects of erosion and how to remedy them, which we think may afford useful hints to others besides farmers. The denudation or washing of lands in the higher levels of the earth's surface has been one of the most important factors in the geological changes which have so modified the surface of the earth. As a rule, this denudation is exceedingly slow, and the general level of large tracts of country is not lowered more than an inch or two in a hundred years: but, when it is excessive and more rapid than the natural decay of the subsoil material which is exposed, it may work serious injury to agricultural lands.

The excessive erosion of washing of lands may be prevented, the fields already cut up with gullies and watercourses may be recovered, and steep slopes may be held and prevented from washing, by chemical means, by cultivation and under-drainage, by reforestation, and by grass and similar vegetation.

I.—CHEMICAL RELATIONS OF THE SOIL TO SURFACE WASHING.

Surface erosion can be largely prevented by such a system of cultivation and cropping as will introduce as large a quantity of organic matter into the soil as possible. A very old method of recovering washed and gullied lands is to place straw in the furrows while ploughing, the straw not only acting

* Notes on the Painted Glass in Canterbury Cathedral, with Plates. With Preface by Very Rev. F. W. Farrar, D.D., F.R.S., Dean of Canterbury.

* From Transactions of the A.S.M.E.

mechanically to hold the soil in place and prevent surface erosion, but also in a very efficient way to increase the quantity of humus, thus making the soil hold large quantities of water which otherwise would have passed off over the surface.

As soon as a sufficient supply of humus has been accumulated and the lands are brought up to an adequate condition of fertility, clover or grass should be seeded if the land is at all suited to these crops, or rye, oats, or field peas should be sown to help hold the surface.

A soil containing a fair supply of lime is much less liable to wash than one similarly situated and exposed which is deficient in lime. Clays which are heavily impregnated with lime salts are in a flocculated state, the fine grains of clay being held together and in contact with the larger grains of sand. This flocculated mass quickly settles, and is originally not so easily disturbed and carried off by moving water. A stiff clay soil is practically impervious to the penetration of surface water when it is delivered in such torrents as we are liable to have in our summer storms. A well limed soil, on the contrary, although it may contain as much clay, but in which the particles are flocculated or drawn together, is much more pervious to water, and the amount of water which the soil will carry down through under-drainage is increased, and the excess which has to flow off over the surface is diminished.

II.—WASHING OF LANDS MAY BE PREVENTED BY METHODS OF CULTIVATION AND UNDER-DRAINAGE.

A field in a condition of fine tilth and ploughed to a depth of 10 in. will hold 2 in. of rainfall and absorb it very readily, and a soil in such a condition will suffer no surface washing from any ordinary rainfall. This will not only save the surface from being washed and gullied, but it will also increase the store of moisture held by the soil, which is of very great value in the time of drought.

It is important also for this, as for other reasons, that the soil be covered with vegetation as much as possible throughout the year, as the roots and organic matter serve to bind the grains of the soil together.

Another very effective method, when properly carried out, to prevent the washing of lands is to under-drain the soil with tile or other drains. These drains carry off quite rapidly an excess of moisture, so that much more of the rainfall is absorbed by the soil and carried off through the drains and less washes over the surface of the land.

In cases where these methods may not be sufficient it will be necessary to provide for a more uniform distribution of the flow over the surface, and to prevent any accumulation of water which would have the effect of a torrential stream. This is secured in a great measure in cultivating the soil by laying off the rows according to the contour of the surface, so that each row will have a very slight incline of not more than from 1 in. to 6 in. in 100 ft., in which the flow of water would be so slow that there would be little or no erosion.

To prevent an accumulation of water from breaking down the rows, larger and more substantial ditches may be provided, following very nearly the contour of the field, so that there shall be a fall of from 1 in. to 6 in. in 100 ft. The distance apart of the ditches will depend upon the slope of the field; with a very steep slope they should be close together, often not over 6 ft. to 10 ft. apart; with a gentle slope they should be at intervals of 15 ft. or 20 ft., or even farther apart, depending upon the texture of the soil and the contour of the surface.

These sidehill ditches are very easily constructed, being made almost entirely with the plough. It is well to get the bank forming the lower side of the ditch sodded with grass to help to hold it and to lessen the danger of its giving way during a heavy rainfall. Unless these ditches are thoroughly constructed they are worse than useless; for, if they break, they concentrate a volume of water upon one point in the field which would otherwise have been distributed over the surface, and this often forms a torrent which does great damage. They should always be run with a level, of which there are several forms on the market suitable for this work.

A more efficient, but at the same time much more expensive, method of preventing the washing of lands where there is a considerable slope, is to terrace the fields so that there shall be level steps upon which the water can rest for awhile and be absorbed.

III.—RECOVERING GULLIED HILLSIDES BY REFORESTATION.

Forest ground is not subject to this erosive action of the rainfall, because in a forest a large part of the rainfall never reaches the soil, as 20 or 30 per cent. is intercepted by the foliage and evaporated before it reaches the ground. The rainfall which reaches the surface is rapidly absorbed, as the soil is kept granular and loose and much more of the water is carried off by under-drainage rather than by surface drainage.

Just as deforestation of hillsides and hilltops is the first cause for inducing erosive action, so is reforestation the most effective means in curing the evil. This has been demonstrated in France, where the Government and the farmers together have spent during the last thirty years over 40,000,000 dols., and expect to expend three or four times that amount to reforest 1,000,000 acres of denuded mountain-sides, the soil and debris from which has been carried by the torrents of water into the plain, covering over 8,000,000 acres of fertile ground and making it useless for agriculture. Sodding for pasture has been found mostly less effective, and on the steeper slopes entirely ineffective.

Wherever the ground in the hill-country is not fit for agricultural use it should be set and kept in forest, not only to make it produce a timber crop, but also to prevent the erosion which finally becomes dangerous to the lower valley lands. The forest should occupy all hilltops which, as a rule, have too thin a soil to allow profitable agricultural use; it should be kept growing on the steeper slopes, where the water acquires the greatest momentum and the loosening of the soil by the plough furnishes a most favourable condition for erosive action; it should be placed on all rocky, uneven, agriculturally useless spots, because it will produce useful material even on such unfavourable situations, and, finally, forest belts should be maintained on long slopes alternately with fields and pastures, running along the brow of the slope of widths and at distances proportionate to the character of the land and the angle of the slope—on the steeper slopes closer together, on the gentler slopes further apart. In the deeply gullied hill lands, where ploughing is impracticable, it is necessary to break the force of the water by constructing brush dams across the gullies, as shown in the second illustration, and roughly fill in the latter with stone, gravel, earth, &c., in front and rear if they are shallow, and at least in the rear if they are deeper. Where the ravines are especially deep and wide, it may become necessary to supplement and strengthen the rough dam with a loose rubble embankment or a dry wall of stone. A simple and efficient method has been practised in France, which consists in filling up the ravine with brush placed lengthwise, and keeping this down by poles laid across and fastened in the sides of the ravine. The waters are thus allowed to drain off, while the soil carried by them is retained in and over the brush, and in a short time the gully will fill up of its own accord; then alders and willows are planted along the edge, and soon finish the work of securing the ravine against washing. The means for thus breaking the force of the water in the gullies and changing it from a rushing torrent into a series of gentle falls, and in part from surface drainage into subterranean drainage, and of filling up the gullies themselves will have to be devised in every special case as circumstances permit and the ingenuity of the operator suggests. The brush dam is preferably made of willow, poplar, alder, or other readily sprouting material, which becomes alive, and, by striking root, adds to the firmness of the dam.

PLANTING.

To cover the soil as quickly as possible with a dense and permanent aborescent cover is the object to be attained. Where the soil has not been so far eroded that ploughing could be done, it might be best for the first season to sow oats, field peas, or other crops that will readily grow and make a cover. The cheapest and most readily germinating tree seed should be looked for, and the quantity used per acre should be lavish, to secure a dense stand from the first. The most readily available kinds are the silver or red maple, box elder, elms, ash, and black locust, and, since for various reasons variety or mixed woods are preferable, it is advisable to use as many kinds as can be readily obtained.

Where the ground is too much cut up and too uneven to permit of ploughing, recourse must be had to sowing of seed in plats, or planting of

seedlings or cuttings by hand. This is naturally much more expensive, and therefore should be done with greater care and foresight. Plats may be made by loosening the soil with a hoe or spade, and sowing the seed into these seed beds, covering the seed only slightly. The plats should be 3 ft. to 4 ft. apart to make sufficiently rapid cover.

The cheapest and most readily growing material for the general cover is furnished by the willows and poplars, to which may be added the box elder, the black locust, and the catalpa, while other more valuable kinds may be introduced, when the first cover has been established, by the planting of two or three-year-old plants in single specimens.

The first and principal object being to break the force of the surface waters, the arrangement in setting out the plants should be as nearly as possible in horizontal and parallel rows along the brow of the hill, following the contours. To get a full cover as soon as possible, the plants should be set not farther apart than 3 ft. to 4 ft. and even less, making from 5,000 to 7,000 per acre. If this is found too expensive, or for some reason impracticable to be done at once, the work may be reduced and divided into several seasons; the rows then may be made farther apart, say from 6 ft. to 16 ft., according to the slope, and the plants in the row 2 ft., when the number will be one-half or less.

IV.—GRASSES AND SIMILAR VEGETATION PREVENT EROSION AND WASHING OF AGRICULTURAL LANDS.

On gentle slopes a good turf of perennial pasture grasses, especially those with creeping rootstocks, prevents corrosion, or washing of lands, and short, steep embankments may also be protected with this same covering. On longer and steeper slopes, however, this method is not so effective as that of reforestation.

In enumerating the effects to be obtained by the growth of grasses and other herbaceous vegetation on washing lands, or lands liable to be eroded, it should be stated that such growths are calculated to break the force of the rainfall and prevent its packing the soil; to render the ground more porous through the root penetration into the subsoil; to make the soil more absorbent and more retentive of moisture through the addition of humus to the soil from the decay of the plants; to retard the rate with which the surface waters flow off; and, lastly, to bind the particles of soil together, which is especially effective in the case of light, sandy lands, and of newly-formed embankments, whether of sand or clay.

CHIPS.

It has been decided by the Health Committee of the Liverpool Corporation "that in future the city engineer, before recommending the committee to prescribe a building line, confer with the surveyor as to the probable cost and amount of compensation that may have to be paid."

A refuse destructor is in course of construction at Yarmouth, and various alterations have been made which tend to increase the cost. The last has been the substitution of a circular for a square chimney shaft at an extra cost of £300, making the total £10,800.

The town council of Shrewsbury have decided to purchase for £30,400, 152 acres of land at Shelton, required for the purposes of the water-supply scheme about to be carried out from plans by Messrs. John Taylor, Sons, and Santo Crimp, of London.

The structural rearrangement of the fish and vegetable section of the Central Market, Farringdon-road, E.C., is proceeding rapidly under the direction of Mr. Andrew Murray, the city surveyor, and will be carried out at a cost of about £9,000. Three or four shops are now ready for occupation, and will be let on lease for a term of seven years.

Lowestoft Town Council have agreed to borrow £6,000 for a technical school and £8,486 for the new sewage outfall works of a bank at 3 per cent.

In the cemetery at Bovey Tracey, a cross has recently been placed at the head of the grave of the late Bishop Knight-Bruce (1852-96), a former vicar of the parish. A shaft of polished granite, surmounted by a combined cross and crown, is let into the lower half of a pyramidal block of similar stone. The grave is surmounted by rough granite stones. The work was executed by Messrs. J. Easton and Son, of Exeter.

Professor Herkomer, R.A., has finished the portrait in oils of Mr. E. D. M. Littler, C.B., Q.C., which he was commissioned to paint by the Middlesex County Council. It is at present on view at the artist's studio, and will ultimately be hung at the Sessions House, Westminster.

FIG. 1.—HOW THE FARM IS LOST.

Cutting off the timber allows surface water to rush rapidly over the ground, washing away soil and cutting surface into gullies.

FIG. 2.—HOW THE FARM IS REGAINED.

Replant the forest and woodlands; check rush of water by brush dams; control drainage by terracing, contour ploughing, and ditching; restore organic matter by manuring and cultivation.

FIG. 3.—HOW THE FARM IS RETAINED.

Cut out the timber judiciously; preserve fringe of wood on banks of streams; divide farm into pasture and woodland; repair at once any damage by water.

Building Intelligence.

ABERDEEN.—Rapid progress is being made with the construction of the corporation lodging-house, East North-street, Aberdeen, where 261 male lodgers will be accommodated. The scheme is being carried out under the Housing of the Working Classes Act. The total cost of the buildings will be £12,000. There are in all five blocks, three of which will be four stories in height. The front dressings are of white granite, and those in the back walls are of red granite. There is a large amount of masonry work in the contracts. Reading and recreation rooms, lavatory, and bath accommodation are to be provided. Messrs. Marshall and Dick, Newcastle-on-Tyne, are the architects of the buildings, and Mr. John Ogilvie is inspector of works for the corporation.

DOVER.—The Hôtel Burlington was opened on Saturday. It faces the centre of the bay, being set back a little from the Marine Parade; but the houses which intervene are to be cleared away, so as to give an unimpeded view of the Channel from every part of the building. The hotel contains 380 rooms, the decoration and artistic furnishing being done by Messrs. Maple and Co. Opening out of the grand hall, which forms the lounge of the hotel, are some decorated and richly upholstered apartments. This chamber is fitted as an Oriental divan, with some Indian carvings forming structural screens and portières, and can also be utilised as a ball or concert-room. Long corridors traverse the three wings of the hotel, and on the upper floors give access to the bedrooms and private suites. They are furnished in various styles, French and English. The architects are Messrs. Murray and Foster. The outlay on furnishing alone has been about £7,000.

FALMOUTH.—The parish church of Charles, King and Martyr, at Falmouth, an attempt to combine Pointed Medieval with Classical details, erected in 1663, has now been unroofed, preparatory to restoration, from plans by Mr. Edmund Sedding, of Plymouth. He recommended that an entirely new roof should be provided, the side galleries removed, the pillars taken down and re-erected, a new apsidal chancel built at the east end, and a new tower over the entrance porch; the present roof, tower, and galleries being quite unsafe. A contract has been entered into for the first portion of this scheme dealing with the main structure only, and on opening up the building it is evident that considerable work must be undertaken beyond that provided for in the contract. The parishioners have raised the sum of £1,200, but £3,000 more will be required to complete the undertaking.

HAMMERSMITH.—The new town hall, which has been erected in the Broadway at a cost of about £25,000, was opened by the Duke and Duchess of Fife on Friday. The design of Mr. J. H. Richardson, of Finsbury-pavement, was selected by Mr. Emerson in a competition limited to seven architects, and was illustrated in our issue of May 4, 1894. The buildings are in the Renaissance style. The front is of red brick with Portland stone. There is a lofty tower between the public hall and the council chamber. The main entrance to the offices is at the north end in Brook Green-road, and gives access to the large octagon hall, with the vestry clerk's offices on the right-hand side in front, the medical officer's department on the left, and the overseer's department on the east side. The corridor walls are lined with Belgium marble, and the floors with marble mosaics. The basement is used for storage purposes, testing of gas, &c. The public hall and the council chamber are side by side on the upper floor. The former is approached by a grand staircase from Brook Green-road, occupies the whole width from front to back, 66ft. by 51ft., and affords accommodation for 650 people. It has a large recessed stage platform. The council chamber is shown externally by a lower elevation than the public hall, having a separate roof and *niche*. It is 42ft. by 28ft., and has a deputation room adjoining. A gallery for the public and the Press is provided with distinct entrance and exit. The second floor also contains artists' rooms and conveniences, while on the third floor are caretakers' rooms. The buildings are lighted by electricity, a separate installation sub-station being provided for the purpose, while the heating is on the low-pressure system. The floors throughout are fire-proof, and each section is provided with iron

doors. The builders are Messrs. Wimpey and Co., of Hammersmith. The heating and ventilating arrangements were intrusted to Messrs. Kite and Co., Euston-road; the electric light fittings to Messrs. Verity, King-street, Covent-garden; the iron construction to Messrs. Lindsay, Neal, and Co., Paddington; and the construction work of the roof and galleries to Messrs. A. Dawney, Nine Elms. The lifts and iron doors were supplied by Messrs. Clark, Bunnett, and Co., and the marble by Messrs. Patterson, of Manchester. The work was superintended on behalf of the vestry by Mr. Alfred England.

LIVERPOOL.—The fever hospital at Netherfield-road, which was taken over by the city corporation in 1885 from a charitable body, and was enlarged in 1887-8 at a cost of £13,640 from plans by the city surveyor, has now again been enlarged. The extension, officially opened on Friday, comprises two new pavilions, having two wards with ten beds each, or a total of 40 beds, and an isolation block containing four wards with ten beds, additional accommodation being provided for 50 patients, thus bringing the total accommodation up to nearly 150 beds. The scheme also included the extension of the laundry buildings and the provision of new machinery and fittings, these being used entirely for the cleansing of the patients' clothing while the old appliances are reserved for the use of the staff. A new lodge has been erected containing discharging rooms, waiting rooms, and porters' office, with bedroom accommodation for five porters. Improved accommodation has also been provided by the alteration and enlargement of the administrative block, giving additional bedrooms for ten nurses and eight servants, the total staff now provided for being one doctor, one matron, 25 nurses, 22 servants, and five porters, total 54, as against 32 before the extension was made. A new approach to the hospital has also been made of easier grade from Netherfield-road. The total expenditure of this scheme, including the cost of acquiring properties, furnishing, electric lighting, drainage, and laundry machinery, amounts to about £26,000, while the area of the recent extension is 5,500 square yards, thus making the total area of the hospital 15,140 square yards.

LEXDEN.—The parish church of Lexden, near Colchester, was reopened on Sunday after the renovation of the nave. Some time ago a new chancel was built, and in order that the interior of the building may be as harmonious as possible, the work of reseating and decorating the nave, as well as lowering and relaying the flooring, was a short time since intrusted to Mr. R. Beaumont, of Lexden. Some of the carving in the chancel and on the gallery front, and two open-work screens which have just been added to form the ends of the clergy stalls, have been executed by the rector, Canon Lester. The nave is now seated with oak pews, the ends of which, abutting on the aisles, are carved in patterns copied from standard antique examples, and the whole floor of the nave has been lowered 6in. and laid with wood blocks. The side and end passages, as well as the porch, have been floored with red-and-black tiles. The wooden panelling which forms a dado to the north and south walls of nave has been decorated with a quiet ecclesiastical pattern. To the font have been added a base, floor, and steps in various rich marbles. Carved corbels, supporting figures of angels, have been added to the chancel arches, as well as some other carving.

LONDON COUNTY COUNCIL.—At Tuesday's meeting of the County Council it was, after a long discussion, decided that, subject to the Wandsworth District Board agreeing to pay the Council a sum of £10,000, and to a further sum of £5,800 being raised by subscription, the Council should purchase for £31,500 a plot of land 20 acres in extent abutting on the Putney-bridge-road, Wandsworth, and having an extensive river frontage, with a view to its being laid out as a public park and recreation ground. The Housing of the Working Classes Committee recommended that the work of constructing the sewers and roads with temporary surfaces on the Millbank estate be carried out by the Council without the intervention of a contractor, and that the plans, specifications, quantities, and estimates of £11,635 be referred to the works manager, Mr. Adams, for that purpose. This was agreed to after discussion and a division. The same committee also brought forward recommendations with regard to the building of certain blocks of artisans' dwellings. The first two blocks were Hogarth Buildings, to be placed on the Millbank

estate at an estimated cost of £14,690, and Romney Buildings, in the Boundary-street area, at an estimated cost of £14,576. It was agreed, without discussion, that tenders should be invited for this work, the committee having presented a supplementary report stating that the works manager was not prepared to undertake the work of erecting Hogarth Buildings and Romney Buildings at the architect's estimate. The committee recommended that Clifton Buildings on the Boundary-street area, estimated to cost £17,943, be erected by the Council, without the intervention of a contractor; this was assented to. With regard to the Molesey Buildings, estimated to cost £5,460, Lord Onslow moved that the work should be tendered for. This motion was defeated, and it was decided that the work should be dealt with by the department. On the recommendation of the General Purposes Committee it was resolved that an expenditure up to £100 be authorised for the purpose of printing a register of buildings of historic or architectural interest in London, on condition that the particulars, plans, and drawings which would form the register were presented to, and became the property of, the Council. The particulars for the register have been completed so far as the parishes of Bow, Poplar, and Bromley are concerned, by the Committee for the Survey and Registration of the Old Memorials of Greater London. The registers, plans, and drawings will be presented to the Council free of cost.

NAIRN.—The new parish church was opened on Friday. The site, which is a gift, is very central, at the corner of Seabank-road, at the west end of Nairn, and the edifice has been erected at a cost of £9,000. The style is of the Early English Transition period, and is from plans by Mr. Starforth, Edinburgh. Its main external feature is a massive square tower at the west end, about 100ft. high, in which is the main entrance. On either side of the main tower are two smaller towers, which give access to the galleries. The material used is the old red sandstone of the district, and where the masonry is plain it consists of bold hammer-dressed rubble. The interior of the church is transeptal in design, but the seating is arranged on a circular plan. Two memorial windows have been presented to the church. The church is seated for 1,200 persons.

NORTHWICH.—On Saturday afternoon the Duchess of Westminster formally opened the Verdin Technical Schools and Gymnasium at Northwich. The schools and gymnasium are built on a site in London-road, free from chances of subsidence, containing 2,679 yards, and having a frontage of 132 yards. Plans were prepared by Mr. Joseph Cawley, architect, Northwich, the contract being let to Mr. W. Molyneux, also of Northwich. The two principal façades are in the style of the English Renaissance, the whole being enriched with terracotta ornament and stringing. The building is of two stories, and within it provision is made for technical and manual instruction, art teaching, &c. There are a chemical and a physical laboratory, an art school, 47ft. by 32ft., four classrooms, workshops, cookery-room, and laundry, with all the necessary adjuncts thereto. The gymnasium is placed on the south side, and is 60ft. long by 31ft. 6in. wide, and of unusual height, a gallery being placed at one end. Stained glass fills two of the windows—the Empire window over the main entrance, and the Victorian window over the entrance to the art department; both were executed by Mr. G. Sutherland, of Manchester. The inclusive cost of the buildings is £12,000.

The Post Office (Sites) Bill came on Friday before a Select Committee of the House of Commons. The Bill proposes to enable the Postmaster-General to acquire lands in London, Brighton, Norwich, Plymouth, Southampton, Oban, and Cork for the public service. This part of the measure was passed, but clauses confirming an agreement in relation to Aldersgate Public Garden or Postmen's Park were struck out. The Bill was reported to the House for third reading.

A new organ, built by Messrs. Harrison and Harrison, of Durham, has just been opened in the Free Kirk, Lerwick, Shetland Isles.

The dedication of a new school building, an addition to the schools of St. Nicholas with St. Leonard, in Queen Charlotte-street, Bristol, took place on Friday. The new building, which has been erected by Messrs. Love and Waite, from plans by Mr. W. V. Gough, also of Bristol, is principally to be used, the basement for cookery, and the first floor for drawing.

Engineering Notes.

STEEP-GRADE RAILWAY AT THE DEVIL'S DYKE.

A railway or tramway running up and down the precipitous face of the Devil's Dyke, about half a dozen miles north-west of Brighton, was opened on Saturday. There are already established at the highest point of the dyke an aerial railway running from hill-top to hill-top, and other contrivances. The steep-grade railway, however, claims some amount of utility, in affording rapid communication between the Brighton Railway Company's branch terminus at the head of the Dyke and the villages lying in the plain at the foot of the Dyke hills. It is of the same type as the cliff railways at Scarborough and elsewhere, although the engineer, Mr. C. O. Blaber, has introduced some new features in the details of construction. The whole length of the line, which is a double one of 3ft. gauge, is 840ft., the "lift" being 395ft. From the top there is a run of 240ft. at a gradient of 1 in 1.8, the second and steepest part being 1 in 1.5, and the last and lowest gradient 1 in 2.9. The vertical curves between the different gradients have about 1,000ft. radius. There being a scarcity of water as well as of solid fuel at the head of the Dyke, the hauling power is obtained from a Hornsby-Ackroyd oil-engine. The haulage ropes are 2in. steel wire cables, and the cars, each seating 14 persons, are fitted with powerful brakes, by which a car running down hill would be promptly stopped before any great momentum had been obtained. The brakes are also designed to prevent the cars from leaving the track. There is a powerful brake on the shaft of the main hauling pulley, worked by a foot lever, as well as from the platform. The opening ceremony was performed on Saturday, by Sir H. Howarth, M.P., who turned the lever which set the cars going.

SUTTON BRIDGE.—The new railway and road bridge across the river Nene at Sutton Bridge was formally opened last week. It replaces a structure on the same site erected by Robert Stephenson in 1850, at a cost of £18,000, and provides a connection between Lincolnshire and Norfolk. One half of it is set apart for road-traffic, for which a toll is charged, and half for railway-traffic. It is a swing bridge, the pivot pier being formed of nine small cylinders arranged in three parallel rows, the two other piers in the river being constructed of four cylinders similar to those in the pivot pier. The spans are from east to west, 50ft., 77ft., 99ft. 3in., and 69ft. 3in. The abutments are of brickwork in cement, resting on piles. The cylinders used in all the three piers are alike; they are of cast iron, 10ft. diameter at the bottom, tapering in a length of 10ft. to 6ft. diameter. The nose-end and pivot piers are protected by timber fenders of creosoted pitch-pine. The ground through which the cylinders passed was bad, consisting of fine silt, peat, sand, gravel, and a few thin layers of clay. They were sunk in the usual way under compressed air, to a depth of from 56ft. to 68ft. below high-water mark. The two fixed spans each consists of three main steel-plate girders, 7ft. 6in. in depth, with cross girders and rail-bearers. The girders in these two spans rest on cast-iron bed-plates bolted to a steel box girder, which runs along the top of the four cylinders. The main girders are 17ft. 3in. from centre to centre, dividing the bridge into two parts, each 15ft. clear width, the southernmost side being used for the railway, and the other for the road. The swing span consists of three main girders with cross girders and rail-bearers, as in the fixed spans, the distance from the pivot to the nose-end being 98ft. 3in. The swinging is effected by hydraulic power. The bridge has been built for the Midland and Great Northern Joint Committee, Mr. J. Allen McDonald being the engineer. Messrs. Handyside and Co., of Derby, are the contractors, and the hydraulic work was supplied by Sir W. G. Armstrong, Whitworth, and Co., Limited, of Newcastle-on-Tyne.

BRITISH ASSOCIATION OF WATERWORKS ENGINEERS.—The annual meetings at the Town Hall, Westminster, to which we referred in our last issue, were brought to a close on Friday, under the presidency of Mr. H. Ashton Hill. Mr. W. Coles Finch, of the Brompton, Chatham, Gillingham, and Rochester Water Company, opened the proceedings by reading a paper on "Electrical Water-Level Recorders," describing one of which he had had charge at the City of Rochester Strood Waterworks. It was invented

by Messrs. Barr and MacWhirter, of Glasgow, and made by the Glenfield Company, of Kilmarnock. The author showed that not only is the electrical recorder useful for the purpose for which it was primarily intended—namely, recording the water-level in the reservoirs, but it can be also used for the purposes of detecting and locating waste, for indicating and recording the variations of level in wells, and for testing the yield of wells and springs at various times. Mr. J. Shaw, of Boston, Lincolnshire, read a paper entitled "Notes on Distribution." The writer stated that whilst in the old times hydraulics were well understood, and Greece and Rome had their aqueducts and great public supplies of water, mechanical difficulties prevented any real domestic supply. The minute details on the methods of distribution as to mains, sewer-pipes, and hydrants, and the means of preventing leakage, were dealt with. The discussion on both papers was taken together, in which Mr. C. Gilby (Bath), Mr. W. Matthews (Southampton), Mr. Whitaker (Croydon), Mr. Robert MacIntyre (London), Mr. H. Francis (Devonport), Mr. C. E. Jones (Leyton), Mr. F. J. Bancroft (Hull), Mr. C. H. Priestley (Cardiff), Mr. Donald Cameron (Exeter), Mr. W. G. Pierce (Richmond), and the chairman took part. Mr. Shaw and Mr. Finch replied to the various criticisms, and votes of thanks were passed to them. On the motion of Mr. Gaskin, a vote of thanks was accorded by acclamation to the president for his conduct in the chair, and the meeting concluded. In the afternoon the members visited the Southwark and Vauxhall Water Company's works at Hampton, and on Saturday the members proceeded to Windsor for the purpose of visiting the Corporation Waterworks on Tangier Islands, Eton.

CHIPS.

The principal business in the Coventry City Council at their last meeting was a report from the Electric Light Committee recommending the extension of the works, plant, and mains, at an estimated cost of £37,900, making a total capital expenditure from the outset of £71,000. The greater part—£27,900—of the proposed expenditure is to go in mains, so that outlying districts may have the benefit of the light.

Mr. W. Q. Orchardson, R.A., having completed his portrait of the Earl of Derby, K.G., as Lord Mayor of Liverpool, the framed canvas has been formally accepted by the committee who were intrusted with the task of securing for the city a permanent memorial of his fourth year of office. The earl is represented as seated and wearing the robes of a chief magistrate, and the portrait will be hung at the town hall.

The memorial to the late Poet Laureate, which takes the form of an Iona cross on the Beacon Down at Freshwater, is now erected, and will be dedicated by the Archbishop of Canterbury on Friday, August 6, at 3 o'clock p.m. The cross was designed by Mr. J. L. Pearson, R.A., and is made of Cornish granite. It has been taken over by the Trinity House, and will serve as a sea-mark, under the name of the Tennyson Beacon, in place of the Old Nodds Beacon.

On Thursday and Friday a Local Government Board inquiry was held at Spalding before Mr. Wilcocks, C.E., into an application by the urban district council for sanction to a loan of £3,400 for the enlargement of the Corn Exchange and Butter Market, and £300 for the purchase of a steam roller. The plans for the Corn Exchange and Butter Market enlargement have been prepared by Mr. Corby, of Stamford, and a provisional contract has been entered into for carrying out the work with Mr. Sherwin, of Boston, his tender being just under £3,000. The enlargement of the Exchange would accommodate 20 additional corn-stands, and it is proposed to enlarge the Butter Market by extending it underneath part of the Corn Exchange, the floor of which would be raised so as to give the underneath Butter Market a headway of 8ft.

Mr. Silvanus Trevail, F.R.I.B.A., of Truro, has had to sever his connection with the Cornwall County Council, of which he has been a member since its formation, having been appointed architect for the extension of the county lunatic asylum at Bodmin.

The Belfast Corporation have applied to the Irish Local Government Board, among other things, for leave to borrow £11,000 on the proposed new police cells, the present arrangements being in a very unsatisfactory state. There are to be 51 cells for the accommodation of 107 prisoners. There are to be new offices for the Commissioner of Police, the detective department, and a medical man and matron.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

WILTSHIRE ARCHÆOLOGICAL SOCIETY.—The members of this society held their summer meeting on Tuesday and Wednesday at Bradford-on-Avon, the centre of a very interesting district. The business meeting was held on Tuesday afternoon at the Town-hall, under the presidency of Mr. C. H. Talbot. The Rev. H. E. Medlicott then read the report, which stated that at the present time there were 333 annual members, 21 life members, and 19 exchange members, making a total of 373, which was a decrease from the numbers last year. There was an increase of a few pounds in the funds of the society. The additions to the library and museum had been again considerable. The railway proposed to be constructed by the Great Western Company from Pewsey to Salisbury would pass near many of the important relics to which solitude and remoteness were protection; and, with 40,000 acres for military manoeuvres, the absence of the protection of solitude and remoteness was likely to become a melancholy reality before their next meeting. Education and improved taste must be relied upon for the due preservation of the relics of Salisbury Plain. The cutting and levelling of some short lines of railway in the county ought to give geologists an opportunity for further research. The report was adopted, and honorary officers were re-elected with some additions. Leaving the town-hall, the party proceeded to the old Saxon church, under the guidance of Mr. C. S. Adye, M.S.A., who gave some interesting particulars respecting the structure. There are nave, chancel, and a porch on the north side of the nave. The original step of the chancel, although much worn, is still *in situ*, and is well worthy of inspection. The walls of the church are of various thicknesses from 2ft. 4in. to 2ft. 6½in. There were no doors to the entrances on the north or south side, and Mr. Adye conjectured that the nave was at all times open to the people, while the chancel would only be exposed to view during Divine service. The building was evidently insufficiently lighted, as there were only three original windows. The chancel window remains just as when it was first built, but the other two windows have been mutilated. Mr. Adye suggested that perhaps the deficiency of light might be due to the fact that glass was difficult, if not impossible, to obtain. The edifice was so near the parish church that there was no necessity for service there. Though the trustees had to keep the Saxon church in repair, yet contributions forthcoming left some profit. Although the structure was small, yet it was striking on account of its height. When first discovered by Canon Jones the church was used as a school, and there was a master's house built on one part, while a large stable hid the architectural features. On the east side was an old house covered with ivy, which hid the church from view. Inside, the nave was divided into rooms for the school, and the chancel formed a labourer's cottage—to such base use did it come. On obtaining possession the trustees took down the modern buildings, lowered the ground, and removed the partitions and doors, and exposed the original work. They replaced missing portions of the old work, but did not remove a single stone of the original structure. In taking down the chimney-stack erected between the chancel and the nave all the stones of the arch, except one, were discovered. Canon Jones found out the church through directing his attention to the building as he gazed on it from a hill in the locality. He believed that there were a nave and a chancel, and this was the first intimation of the original structure. The interior had been so altered that no one could then have recognised it as built for ecclesiastical purposes. The parish church, which is dedicated to the Holy Trinity, was next visited under the guidance of Mr. Adye. It is a noble structure, though opinions differ as to the value of the restoration carried out by Messrs. Manners and Gill, of Bath, in 1866. The original church was built in the 12th century, and in the 14th century the chancel was lengthened by about 16ft., and it is now 48ft. long from east to west. The nave was formerly separated from the chancel by an oak screen and a wood loft, and the screen must have been richly coloured, to judge from the remains. Barton Farm was visited specially to see the spacious tithe barn, which was erected towards the end of the 14th century. It was the tithe barn of the Abbots of Shaftesbury, and is 170ft. long and 20ft. wide.

There are four porches—viz., two on the north and two on the south side. The farmhouse contains some remains of the original building, the date about the same as that of the barn, and this might have been the residence of the agent of the Abbot. The Hall (formerly known as Kingston House) was also visited. At night there was a *conversazione*, and the president delivered an address, and papers were read.

YORKSHIRE ARCHÆOLOGICAL SOCIETY.—The second excursion organised by this society took place on Friday, the members meeting at Milford Junction in the morning, and, taking carriages, proceeded to Steeton Hall. The numerous shields were examined, and the vaulted room and other fragments of Mediæval work were a source of interest to the visitors. Ledsham and Monk-fryston Churches were next visited. Birkin, the next place seen, is one of the most perfect examples of a small Norman church to be found in Yorkshire. With the exception of the addition of an aisle, it was found that it had been very little altered. Brayton Church was the last place visited. The earliest part of the present structure is of about the same date as the Norman work of the church at Birkin, and represents a church built under the same influence, but on a larger scale. The tomb of George, Lord d'Arcy (1558), and the arms thereon were matters which proved exceptionally interesting. Mr. William Brown, the secretary, gave historical notes on each church visited, and Mr. J. Bilston, F.S.A., submitted the architectural descriptions.

CHIPS.

The Wandsworth public library commissioners have accepted a gift of a piece of land near Wandsworth Common from Mr. H. N. Corsellis on which to erect a branch free library for that district. The branch will be built and furnished from a legacy of £2,000 left by a late resident in the parish.

A railway is in course of rapid construction, uniting Zermatt with the Riffel Alp, Riffelberg, and the Gorner Grat. Some hundreds of Italian workmen are employed upon it. The railway, which starts from the Zermatt terminus of the branch line from Visp, will be unrivalled in its command of the grandest mountain scenery. The gradients are very steep, and the height to be attained exceeds 10,000ft.

A remarkable instance of the depreciation of the value of agricultural land was furnished at an auction sale which has just taken place at Spalding. A freehold estate, consisting of 125 acres of land, realised only £4,280. It had cost the vendors £11,000.

In order to provide for the wants of the district, which is rapidly extending in population, the directors of the South Hants Waterworks Company are constructing an additional reservoir on the high level at Mitchelmersh, and they propose at once constructing an additional reservoir at Basset. They have also provided additional boiler and engine power, and an engine-house to contain the same will forthwith be erected. The 10in. main from Chandler's Ford to Compton, Shawford, and Twyford has been laid for a considerable distance; and also a duplicate 18in. main from the works at Mitchelmersh to Romsey.

Messrs. Christie, Manson, and Woods concluded on Friday the two days' sale of the collection of objects of art and decorative furniture of the late Mr. George Thomas Robinson, F.S.A., who was for many years art director to Messrs. G. Trollope and Sons, 196 lots realising about £1,000, and including the following: An old English clock, by S. Toulmin, London, in tall case inlaid with panels of scroll foliage and flowers in marqueterie of coloured woods, 7½ft. high—22 guineas (Gregory); an oblong table, with tray top and drawer, of inlaid satin and other woods, the sides inlaid with panels of black and gold lac, 37in. by 25in.—26 guineas (E. Benjamin); and a set of 12 Dutch chairs, richly inlaid with vases of flowers and birds and foliage in coloured woods—32 guineas (Hart).

The workhouse accommodation committee of the Wolverhampton Board of Guardians have had under consideration the offers of three sites of land for the proposed new workhouse. One of the offers relates to a piece of land on the Wednesfield-road, Causeway Lakes; another is off the Hordern-road, Whitmoreans; and the third is situate on the Cannock-road. Owing to the high prices asked, the committee rejected the first and last-named offers, and the value put upon the second plot was considered too high.

The Harbour Board of Southampton have appointed Mr. E. Cooper Poole as surveyor in succession to his father, lately deceased, to whom he was chief assistant. The salary is £100 with 2½ commission on new works, private practice being allowed.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXI. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

* In response to complaints from readers that they are unable to get the BUILDING NEWS at Messrs. W. H. Smith and Son's bookstalls, we can only suggest that they should order the paper of some other newsagent. Messrs. W. H. Smith and Son recently requested us to allow them an extra discount beyond that allowed to the general trade, and because we declined they have ceased to send the paper out to their bookstalls. We have, of course, no remedy; but we do not think the demand was a fair one.

RECEIVED.—F. H. P.—E. C. N.—M. and N. G.—B. W. R.—G. J. and Son.

Correspondence.

MR. JUSTICE CAVE AND ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—From your report of the case of "Jalland v. Tyler and Hind," in your issue of this day, it appears that no less than ten architects and surveyors were called upon to give evidence.

The learned judge, in summing up, is reported to have said that "there are no such unsatisfactory men as architects," inasmuch as they failed to come to some sort of agreement, like other scientific men! Lawyers, as well as doctors, disagree, and prosper under the process, and there have been cases beyond number where even judges have differed from each other, and have reversed and re-reversed decisions. If two or three judges cannot agree, it appears less likely that ten architects should do so.—I am, &c.,

GEORGE H. BIBBY.

Hampstead, N.W., July 23.

SPONTANEOUS CONFLAGRATION IN SUMMER.

SIR,—The frequency of serious damages by fire in summer may seem somewhat paradoxical to the outsider, as he might suppose they ought to be much decreased then owing to the less necessity for them for warming purposes than in the

winter, when fires are really wanted. Mansions, cottages, flats, factories, timber-yards, goods warehouses, ships, chambers—all are indiscriminately selected for conflagration in summer, apparently, whether they are occupied or not, or are in full work or left alone.

Spontaneous combustion of lightning and intentional incendiarism are invoked to account for them, and tramps, blacklegs, and boycotting and strikes are anathematised by the owners of destroyed properties. If one, however, considers the question in a more scientific spirit, it may be brought within the area of rational explanation by chemical speculation. The final combustion or flaming-out of timber or wood may be but the last stage of chemical action of heat and air acting on unstable organic compounds, as the rise of temperature of a tree, say, at 52° Fahr., up to 2,000° Fahr., temperature of average flame ignition. Each stage of the thermometer records above 52° Fahr. the wood might be subjected to by heat of sun or air would mark a progressive change in the chemistry of its organic constituents.

By 212° Fahr. all the moisture would be driven off, and would not return. The resins and oils would go next, say at 400°, not to return, and the starches and sugars would follow next to be decomposed and not evaporated, say at 600°; and lastly the woody fibre to be charred, say at 900°. Each of these increments of heat and change need not be effected in one event, but in successive events at long intervals of time or seasons, or years; but each would be permanent, and ready for the next *coup de soleil*, till the last increment, however small, converts the timber into a tinder, ready, by a few additional degrees of heat, to explode into flame. Say a bulk of wood projecting into a chimney-stalk, which is bathed for 12 hours a day by a stream of hot air of 160°, and for 12 hours is cooled down to the outside air of 56°, the change effected by the one is passed on to the other by increment of degrees, or accumulated degrees, not by actual elevation of temperature at a given moment.

Again, a ridge beam of a roof of a house or factory, insufficiently insulated, may be subjected in the daytime to solar heat, say of 140° Fahr., which effects a certain organic change in the wood. It gets cooled down at night, but the heat has done its work on the wood for the time. The next day of solar temperature of 140° Fahr. would effect a mischief of 280°. Another day of the same heat would change the conditions of the wood as if it had been 420° Fahr. exposure; and again, a fourth day of 140° in the sun would have done the damages of 560°.

At length, by successive increments of heat and chemical change, say of eight days of 140° exposure to the sun, the timber is ready for exploding into a real flame at 975° Fahr. by the smallest additional increment, say 150° Fahr., on some particular hot day in summer.

Similar phenomena may be surmised to take place in winter weather, where domestic fires are increased in number and amount, and furnaces and hot-air pipes, machinery, are set agoing with increased industry and power.

The accelerated degree of a hot-air apparatus would soon then mount up from 60° Fahr. to past 212° Fahr., when it would become gradually more dangerous to timber after passing the temperature of boiling water, and of evaporations of water from wood construction and fittings in the buildings. In order to lessen this tendency of timber to degenerate under the influence of heat to firing point, it may be pertinent to suggest that its calcification or silicification might be useful for specified purposes. Wood would then be converted into fossil wood, which is unflammable.—I am, &c.,

W. I. BLACK, F.R.M.S.

The Public Works Loan Bill, issued on Friday, authorises the Government to issue loans to local bodies at 2½ per cent. instead of at 3 per cent. as under the present law.

The dinner given annually by the Edinburgh Merchant Company on the occasion of the close of the summer session of the schools took place on Friday evening in the Hall, 14, Hanover-street. Between seventy and eighty gentlemen attended, the guests being received by the Master, Mr. W. Wybrow Robertson, H.M. Board of Works, who afterwards occupied the chair. In proposing the health of the chairman, Lord Kinnear congratulated Mr. Robertson on the success and distinction achieved by his son, who is now the head boy in the school.

—MAYORAL CHAIN FOR ARUNDEL, MADE BY MESSRS. HARDMAN, POWELL, AND CO.

Our Illustrations.

ST. ANSELM'S CHURCH, MAYFAIR; W.

We have already given the plan* and exterior view† of this church, lately erected on a site given by the Duke of Westminster in Davies-street, W., from the designs of Messrs. Balfour and Turner, architects, to provide for the congregation of Hanover Chapel, Regent-street, now pulled down. The church is, in many respects, very unusual, both in architectural design and in internal arrangement, giving the building an individuality which greatly enhances its interest. The arcade of the nave has double columns supporting also the cross arches dividing the church into bays. Blue Robin Hood stone is used for the interior dressings, the walls being of plaster, white-washed with a dado of glass mosaic. The choir stalls are of teak, and the choir screen walls are of Irish green marble. Messrs. Holt and Sons, of Croydon, were the builders.

NATIONAL SILVER MEDAL: SKETCHES IN BELGIUM.

THIS sheet of artistically-rendered pencil studies by Mr. John D. Walker, of Bradford, represents some typically picturesque street and river views in Bruges, Malines, and Ghent, reproduced from the original drawings, which won last year a National Silver Medal of the Science and Art Department. The subjects are too well known in most cases to require individual descriptions; but for careful sketches, touched in with facility and a due regard to accuracy, these pages from a student's note-book leave nothing to be desired; they cannot fail to recall many a characteristic feature in these quaint old Flemish towns, a familiar hunting ground for the architectural sketcher, and the enjoyable haunt of many a holiday keeper.

PITMAN'S METROPOLITAN SCHOOL.

THE accompanying illustration, giving view and plan, represents the first wing of the above new building, now being erected in Russell-square, W.C., from the designs and under the superintendence of Mr. G. D. Martin, F.S.I., architect, of Pall Mall, S.W. The accommodation is as follows:—Basement: Lavatories and heating apparatus. Ground-floor: Administrative offices of the school. The five upper floors will be devoted to classrooms for the male and female students, the sixth floor being given up to the housekeeper. Space has been left for a further enlargement of the school. The front elevation will be of red brick, with Portland stone dressings. The whole

of the internal fittings on ground-floor will be pitch-pine. The building will be of fireproof construction, and will be lighted throughout by electricity, and ventilated and heated. The builders are Messrs. Perry and Co., Tredegar Works, Bow, and the cost of the building will be about £27,000.

DUDLEY GRAMMAR SCHOOL: SELECTED DESIGN.

THIS is the selected design chosen from 54 plans submitted in the recent competition held at Dudley for the new Grammar School buildings. The cost contemplated is £7,000. The accommodation is for 150 boys. The hall is planned to seat 250 adults, inclusive of the scholars. A headmaster's house adjoins the school. There are five classrooms, seated with dual desks, one being arranged with a north light for drawing classes. There are also a laboratory and small demonstrating-room. The headmaster's room is suitable for committee meetings. Red stock bricks are to be used with red terracotta for the elevations, and brindled tiles for the roofs.

PRESBYTERIAN CHURCH OF ENGLAND COLLEGE AT CAMBRIDGE.

THIS college, which is being erected for the Presbyterian Church of England on an exceptionally fine site at the corner of Madingley-road and Northampton-street, is to be called Westminster College. It is illustrated herewith from the perspective now in the Royal Academy Exhibition. The accommodation comprises classrooms and offices, dining hall, kitchens, &c., library, common room, twenty-six sets of rooms for students, and two sets for fellows, and a principal's house. The materials are red facing bricks, with Clipsham stone dressings, and Colleyweston stone slates. The whole of the construction is fireproof, and a large portion of the internal joinery and carpentry is of oak. Mr. Saint, of Cambridge, is the contractor, and Mr. James Trill is the clerk of works. The design was selected in a limited competition early last year, the architect being Mr. H. T. Hare, A.R.I.B.A. We give this week the main and west elevations, with section through main block, and a double page of details of the dining hall. Next week we shall give a double page of details of the library block on the ground floor.

The Sheffield City Council have received the sanction of the Local Government Board to borrow £12,773 towards the cost of clearing away premises where the Act for the housing of the working classes was to operate.

The Dominion Government proposes to complete the deepening of the St. Lawrence River from Quebec to Montreal this season. Already about 3,500,000dol. has been expended to make the 160 miles of river of a depth of 27½ft. It will require 500,000dol. more to finish the work, and that sum has been voted to the Minister of Public Works for the purpose.

Efforts are being made throughout the State of New Hampshire to preserve Mount Washington from a lumber company which recently purchased it for 100,000dol. The State at present makes no provision for the preservation of the forests, but efforts are being made to induce the State to pass a law which will cover the case. If the lumber company is not restrained, the highest and best-known peak in the Eastern States will be totally stripped of all verdure.

Building operations in Scarborough are proceeding apace. New streets are being formed to the north, the north-west, and the west, and small tenements, with rentals of from £14 to £18 and £20, are occupied as soon, or sometimes before, they are completed. In connection with the purchase of the area lying between North Maine-road and Cemetery-road, and now named the Victoria Park estate, the plans of no less than 467 new houses were last week before the streets and buildings committee of the Scarborough Corporation. These, together with the plans of 55 other houses, make a total of 522.

The contractors for the Jungfrau Mountain Railway are taking advantage of the summer months to push forward the work, and the first blasting of the Scheideck Tunnel began last week. This part of the track pierces through rocks some 50 metres above the Scheideck, winding for some distance through open galleries up the mountain wall of the Eiger, and then continuing as a tunnel to the end of the distance. The route between the Scheideck station and the entrance into the boring is being actively opened out, and admits the use of mountain ballast waggons over a part of the intervening distance; 120 men, mostly Italian navvies, are here at work.

COMPETITIONS.

BLACKPOOL.—The new Liberal club, which it is proposed to erect in Victoria-street (near the tower), is estimated to cost, inclusive of site, about £6,000. Out of the designs received, that of Mr. Herbert Wade, of Talbot Chambers, has been accepted by the committee. The building will be stone-fronted, and the interior will include large assembly-room, billiard-room for four tables, smoke-rooms, registration and committee-rooms, &c. The work will be commenced immediately after the present season.

NUNEATON.—The plans of Mr. Chas. Wm. Smith, M.S.A., architect and surveyor, Market-place, Grantham, have been selected in the recent competition for a new Conservative Club at Nuneaton. The new building is to be four stories high, and will comprise an assembly-hall, two billiard-rooms for two tables each, coffee and smoke-rooms with bar accommodation, reading-room and library, and apartments for caretaker on top floor. A skittle-alley and wine and beer cellars, heating chamber, &c., occupy the basement. The materials to be used are red brick with stone dressings and green slated roofs. The probable cost is £4,000. Over 200 applications were received from architects for particulars of this competition. A short list was made of two from the designs sent in, the authors of which were invited to submit further amended plans, and the committee's decision was in favour of the plans as above stated, and Mr. Smith has now the work in hand.

SALFORD.—The competitive designs for the intended nurses' home in Salford, to be built as a memorial of the Queen's long reign, were submitted on Friday to a meeting of the general arrangements committee, held at the Salford Town Hall, under the presidency of the Mayor, Sir Richard Mottram. After consideration, the plans of Mr. Henry Lord, architect, John Dalton-street, Manchester, were adopted. The architect was directed to prepare working drawings, in order that tenders may be obtained and the work put in hand at as early a date as possible. The pre-miated plans have received the approval of the committee of the Manchester and Salford Sick Poor and Private Nursing Institution, to whom the management of the home is to be intrusted.

CHIPS.

At the last meeting of the select vestry of Liverpool a letter was read from the Local Government Board sanctioning the expenditure of £18,750 on a cottage home at Wavertree.

The Public Health Committee of the Edinburgh Town Council again considered, on Tuesday, the estimates for the erection of the general offices, staff quarters, and scarlet fever pavilion of the New City Hospital at Colinton Mains. After discussion it was resolved to recommend acceptance of separate estimates for each branch of the work, amounting to about £89,000. At last meeting of council the estimate of Mr. Colin Macandrew, amounting to over £93,000, was recommended for acceptance for carrying out the whole of the work, but the matter was recommitted owing to some alleged irregularity in the opening of the estimates.

A new church of St. Paul is about to be erected at Yarmouth, from plans by Messrs. Bottle and Olley, of Queen-street, in that town.

Mr. James Diggle, jun., draughtsman in the surveyor's department of the Heywood Corporation, has been appointed surveyor and nuisance inspector to the Ashton-on-Mersey Urban District Council at a salary of £120 per annum. There were 47 applicants for the post.

Plans have just been approved by the Japanese Imperial authorities for the construction of about twelve hundred miles of railway in Formosa. There is to be one main line and several branches for the development of the interior of the island, in order to facilitate the transmission of produce to the coast for shipment.

Colonel A. J. Hepper, an inspector from the Local Government Board, held an inquiry at the Town Hall, Leamington, on Friday, into the application of the town council to borrow £3,000 for laying out the new Victoria Park, the levelling of which alone will cost about £1,700; £145 for erecting a fence along the river bank in the Jephson Gardens, and for laying on a supply of water for irrigation purposes from the town river water-mains, £850 for the erection of a steel suspension bridge over the Leam, near the mill, and £235 to extend the river wall in the New River Walk. Evidence was given by the deputy town clerk, Mr. C. H. Passman, and the borough surveyor, Mr. de Normanville.

QUESTIONS.

[11714].—**Measuring Stonework.**—Kindly give me an opinion with reference to the following dispute, which has arisen between one of my contractors and a stonemason who is fixing the whole of the stonework for a great number of houses we are building at 3s. 10d. per foot, which was the price agreed. The point in dispute is the measurement of the stonework for the several mullions. I herewith send you sketch of one mullion, and

also the block of stone, showing how they are cut out, and also the measurements I have allowed to the stonemason. His contention is that he should be paid for the square that each block might have come out of, but not the stone which each one was actually cut from.—G.

[11715].—**Marks on Deals.**—Will some practical reader kindly say whether shippers are in the habit of branding their goods with two different marks on the same deals—such as D.F.D. on the end, and D.M. on the flat? Please say what quality these marks represent, and from whence is the timber imported.—W.

[11716].—**Overflowing Cistern.**—Every now and then my cistern at the top of house under the roof gets so full as to overflow through the waste-pipe into the yard below, much to the disturbance of neighbour. I have tried to secure the ball-tap, but in vain, and I think the tap must be worn out, or the lever attached may be stiff and will not respond to the change of water-level. Any advice will oblige.—A HOUSEHOLDER.

[11717].—**Old English Houses at Earl's Court.**—Can anyone inform me what the outer walls of the old stone and half-timber buildings are made of, and what is the stucco used which has been painted to imitate stone and timber so well?—G.

[11718].—**Spire and their Construction.**—Is there any work on spire construction which will give mode of jointing, thickness of masonry, and other details?—PRO RE NATA.

[11719].—**Drain-Pipe Joints.**—Many joints have been invented; but I should like to be informed by a practical man which he considers the best.—T. S.

[11720].—**Gauged Brick Arches.**—How are these set out, and is it necessary to have a cut key brick for the point of a Gothic arch? Will someone kindly reply?—BRICKWORK.

[11721].—**Dry-Rot in Timber.**—Is there any specific that can be used in treating the ends of ground-floor joists affected by this malady, which has spread to the walls above? Remedial measures only can be adopted.—FUNGUS.

[11722].—**Stable Paving.**—I want an impervious jointless paving which can be laid down to old stables. Are clinker bricks with channels the best kind?—F. G. S.

[11723].—**Flushing Cisterns.**—I should like to know of the best flushing cistern for a dwelling-house. Are the lead-lined wood-cased cisterns better than the cast-iron sort? I am told they are. The siphon is also recommended.—AN OLD SUBSCRIBER.

[11724].—**Foundations in the London Clay.**—Bearing in mind that in some recent hot and dry summers a great many houses in N. and N.W. London fractured on account of the evaporation from the clay subsoil on which they were built, causing contraction of the soil below the bottoms of the walls and below the concrete under, would some kind reader, who has had his attention practically turned to the matter and so had actual experience in dealing with it, favour me with his views as to the depth to which the foundations of a house should be carried? The house is about to be built in a district where the London clay is of great depth and comes to the surface, which is fairly level. No cellars or basement of any kind. Height about 30ft. above surface to eaves; stories, ground floor, first floor, and second floor. Also

any hints as to thickness of concrete and width of projection beyond bottom course of footings would be highly esteemed.—R. W. J.

[11725].—**Velocity of Flow of Air.**—I have read of many experiments on the flow of air, and have used various formulae for calculating the same; but I should be much obliged if some of your scientific readers would answer the following questions:—(1) With what velocity will air of 17lb. absolute pressure per sq.in. and 60° temperature flow into air of 8.5lb. per sq.in. and what weight of that air will pass through a well-formed nozzle 1in. in dia. in one minute? (According to experiments the velocity of flow will not be increased if the lower pressure be 0lb. or a perfect vacuum.) (2) What will be the velocity and weight of air passing through a 1in. dia. nozzle if the pressure be 300lb. per sq.in.? (Velocity in feet per second, and weight in lb. per minute.) (3) What is the greatest possible velocity that air—of, say 15,000lb. per sq.in.—could acquire in passing through a nozzle 1in. in diameter? (Temperature of air 60° Fah.) (4) Suppose the temperature of the air in the above cases to be raised to 600° Fah., how would that affect the velocity of flow and the weight of air discharged?—R. W.

[11726].—**Strain of Girder.**—Can Mr. Palmer or "T. C." kindly inform me how should I calculate size of a lattice girder (T-irons top and bottom, or two T's top and two T's bottom, with plates), given the span and the weight such girder is going to support?—J. C.

[11727].—**Roofs.**—How do you find strains on each particular member of a principal of a roof or a lattice girder?—A. D. W.

REPLIES.

[11693].—**Party Walls.**—"G. H. G." in your issue of two or three weeks ago, kindly gave Emden's definitions of the four kinds of "party walls," but hardly fully grasped the question I asked. Taking the four definitions in the order given, what are the privileges of either party as to raising or interfering with the level of the wall or chimney-stacks therein?—H. E.

[11709].—**Slates.**—Write for samples to Tilberthwaite (Westmoreland) Green Slate Co., Kendal.—ALLEN T. HUSSELL, Ilfracombe.

[11709].—**Slates.**—Slates of various sizes are recommended because of the difficulty of obtaining large quantities of a particular size. On a roof of square pitch a 12in. by 6in. slate would be suitable. As to colour, the green slate has not stood London atmosphere well. Before you decide on any quarry, it would be as well to make some inquiries, and to obtain samples. Westmoreland (Kendal) slates are recommended as superior to all other slates of this colour. Penrith green slates and the Coniston grey slates are also good. Consult Laxton for prices and names of quarries.—A BUILDER.

[11708].—**Timber Buildings.**—Books on timber construction are rare. Dallaway's "English Architecture," Dollman and Jobbins's "Analysis of Ancient Domestic Architecture," Henshaw's "Ancient Half-Timbered Houses," Nash's "Mansions of England," Niven's Old Worcestershire, Old Warwickshire, and Old Staffordshire Houses, Parker's works, and Shaw's "Specimens of Elizabethan Architecture," are a few of the best works. For Lancashire examples, look over volumes of the BUILDING NEWS, where illustrations are found of all the important timber buildings in England.—G. H. G.

[11710].—**Lead over Window-Frames.**—"In-experienced" had better strip the plastering off, rake out joints of bricks inside and outside of the damp place, and stop with Portland cement, and replaster inside. It is a good plan when building to insert a sheet of 4lb. lead in the joint of brickwork above the window-frame, turning it up inside. In building hollow walls I have always provided lead over all door and window-frames; this lead to be laid in the outer thickness turned up in the cavity and extending 6in. or more beyond the window-frame. The moisture which finds its way through the outer thickness of wall is thereby intercepted, and escapes at the ends or finds its way through the joint. No damp can penetrate to the inside thickness of wall. Wherever hollow walls are built, especially exposed to rainy quarters, the lead should be used. Of course, a layer of asphalt would also do.—G. H. G.

[11711].—**Lightning-Rod.**—The gables and chimney-stacks should have lightning-rods fixed on the prominent angles and points, and these should be connected together by continuous conductors along the roof ridges. The rods should be 4ft. high, and spaced at intervals not to exceed 50ft. in a large building. Copper tape conductors are preferred; this tape should be 1in. by 3/16in., about 1lb. per foot. Two earth connections are better than one, the conductors leading to them being connected at the base of building. It is better to carry the conductor down that front of building which is most exposed to wet. The gables should have the conductors brought down the verge or barge courses, so as to protect the angle of building. The conductor should terminate in earths offering a large surface, and for this purpose it is a good plan to coil the end of conductor spirally about 4ft. diameter.—ELECTRIC.

[11712].—**Trigonometry.**—In reply to "B. W. L.," let the first angle subtended by the tower be called A, and the third B, and let the distance from the point where the tower subtends 45° to the foot of the tower be called c. Then, since B is 45°, the tower's height = c. Now—

$$\tan. A = \frac{a+c}{c}$$

$$\cot. B = \frac{c}{c-b}$$

But— $\tan. A = \cot. B \therefore A + B = 90^\circ$

$$\therefore \frac{a+c}{c} = \frac{c}{c-b}$$

$$\therefore ac + c^2 - ab - bc = c^2$$

$$ac - bc = ab$$

$$\therefore c(a-b) = ab$$

$$\therefore c = \frac{ab}{a-b}$$

—A. STEWART.

STATUES, MEMORIALS, &c.

WHIPPINGHAM.—The work connected with the Battenberg Memorial Chapel at St. Mildred's, the parish church of Whippingham, is nearly completed. The new sarcophagus, fixed some few feet from the marble altar-table at the east end, to allow space for worshippers, is richly carved. It has taken the place of the plain tomb, which has been standing in the chapel since the funeral of Prince Henry. The base is composed of dove marble, and small triple columns of marble from the Marquis of Lorne's estate in Scotland are arranged at the sides and angles. The panels, of pure white statuary marble, are carved with the orders and the arms of Prince and Princess Henry. The centre panel on the south side has the following inscription:—"Henry Maurice, Prince Battenberg, Governor of the Isle of Wight. Born, October V., MDCCCXVIII. Entered into his rest, January XX., MDCCCXCVI." The massive cover of the sarcophagus is elaborated with scriptural texts, and the Latin motto, "In te Domine spero." The altar-table, constructed of dove and statuary marble, is approached by polished marble steps. Above the table is to be erected the figure of an angel with outstretched wings, which will stand about 8ft. high, and occupy the major portion of the east end. H.R.H. the Princess Louise (Marchioness of Lorne) is now engaged upon this work. The floor is of polished stone, with a border, into which are introduced, in monogram, the initials B.B. In the north wall are three new stained-glass windows, representing St. Henry, St. Elizabeth, and St. Maurice. Mr. Alfred Gilbert, M.V.O., R.A., has the bronze screen and gate in hand.

CHIPS.

Westminster Vestry has decided to go in for asphalt paving in preference to wood. The wood pavement in Victoria-street, Millbank-street, and Chapter-street will be replaced by asphalt, which will be laid down by the Limmer Asphalt Paving Company.

The function of unveiling the statue of Charles Darwin, which has been made by Mr. Mountford, a native of Shrewsbury, for the Shropshire Horticultural Society, will take place on Tuesday, August 10 next, in front of the Free Library, Shrewsbury. The statue will be unveiled by Lord Kenyon, the president of the society.

The board school at Terrace-road, Newport, Mon., is being enlarged and altered from plans by Mr. G. T. Lawrence, of that town. Messrs. Bennett Brothers are the contractors.

Everything is now in readiness for the extension of the museum buildings, William Brown-street, Liverpool. It is the intention of the committee having charge of the matter to ask the city council at its next meeting to allow tenders to be invited for carrying out the work. The architect is Mr. Edward W. Mountford, F.R.I.B.A., whose design, as selected in competition by Mr. Aston Webb, the assessor, was illustrated in our issue of August 14, 1896.

A fire which broke out early on Saturday morning at the Woking factory of the International Electric Supply Company destroyed the main workshops and stores, and did damage to the extent of many thousands of pounds. Among the things destroyed were about £2,000 worth of electrical instruments, and large quantities of machinery and tools, celluloid, and other inflammable materials were stored on the premises. The damage is covered by insurance.

After occupying the attention of the sanitary authorities for nearly a quarter of a century, a scheme of drainage for Ruabon has at length been agreed to. At Friday's meeting of the Wrexham Rural District Council, it was announced that the Local Government Board had sanctioned the borrowing of £6,830 for the purpose of carrying the scheme out, and had recommended the Public Works Loan Commissioners to lend that sum. The clerk was instructed to advertise for tenders for carrying out the work. The deputation appointed to wait upon the Mayor of Wrexham (Mr. Philip Yorke) with respect to the provision of an outfall for the drainage of Rhosyllen reported that Mr. Yorke was prepared to place land at the disposal of the council for sewage-disposal purposes, provided satisfactory arrangements as to details could be arrived at.

Dr. Tristram, the Chancellor of the Diocese of London, held a Consistory Court on Thursday in last week, when Mr. Atlay applied on behalf of the rector and churchwardens of St. Mary-le-Strand for a faculty to enable them to construct a road through the disused burial ground of St. Mary-le-Strand, the proposal being to make a new street communicating east and west between Drury-lane and Catherine-street. Dr. Tristram, in giving judgment, said the faculty would be granted in consideration of the payment of £2,500 to the vestry of the parish, and of £500 to the Metropolitan Public Gardens Association.

LEGAL INTELLIGENCE.

CORPORATION'S POWER TO INSIST ON PARTICULAR WATER-CLOSETS.—WOOD V. MAYOR OF WIDNES.—Mr. Justice Lawrence and Mr. Justice Ridley gave judgment on Saturday in the Court of Queen's Bench in this case stated by two justices of the county of Lancaster. The appellant was the owner of certain houses, 52 to 68, Terrace-road, Widnes. At a petty sessions holden at Widnes a complaint was preferred against him by the respondents under section 36 of the Public Health Act, 1875, claiming payment of certain private improvement expenses in respect of slop water-closets fixed at the appellant's houses. The justices adjudged that the respondents should recover the sum claimed. The facts were as follows:—On February 12, 1895, the respondents, who were the urban sanitary authority for the borough of Widnes, confirmed a resolution of the health committee requiring that in all future reconstructions of privies and ashpits, such privies and ashpits should be converted into the waste water-closet system. On March 22, 1895, the respondents' inspector of nuisances served upon the appellant a notice requiring the appellant to abate a nuisance at his premises, 52 to 68, Terrace-road, by converting the privies into water-closets. On April 3 the inspector reported that certain houses in the borough, including the appellant's, were without a sufficient water-closet, earth-closet, or privy, and on April 9 the respondents confirmed a resolution of the health committee that notice be served upon the appellant and the other owners of the house requiring them to provide sufficient privy and ashpit upon the waste-water closet system approved by the corporation. On April 23 notice was served upon the appellant in accordance with the terms of this resolution, and the notice not having been complied with, the respondents did the necessary work, and then took these proceedings to recover the amount. It was contended for the appellant that the resolution of February 12 and the subsequent proceedings thereunder were invalid. The question of law for the opinion of the Court was whether the resolution of February 12 was valid, or, if not, whether it invalidated the subsequent proceedings.—Mr. C. A. Russell, Q.C., for the appellant, contended that the respondents could only require an owner to provide a sufficient water-closet or privy. They were attempting to enforce in every case the substitution of a particular kind of water-closet—viz., the slop water-closet—for privies. There was no power to do that, and the proceedings were invalid. Mr. McCall, Q.C., for the respondents, contended that it had been decided in many cases that a sanitary authority could substitute water-closets for privies. He cited "St. Luke's Vestry v. Lewis," "Hargreaves v. Taylor," "Ex parte Whitchurch," and "Bogle v. Sherborne Local Board." The Legislature had left the matter to the discretion of the local authority, with a right of appeal to the Local Government Board. There was no finding in the present case that the respondents had treated the appellant's case as part of a general question, or that regard had not been paid to the particular requirements of the case. The Court allowed the appeal. Mr. Justice Lawrence said that it was contended for the appellant that the respondents had, by the resolution of February 12, adopted a general rule that a particular kind of water-closet was to be used, and that this rule was to be applied in all cases, without any regard to the particular requirements of individual houses. The local authority were not entitled to do that. They must inquire into each case, and, although it was not disputed that in every case they could require a water-closet to be substituted for a privy, they were not entitled to say that only one particular kind of water-closet should be used. Section 36 of the Public Health Act, 1875, used the expression a "sufficient" water-closet, and that was all that the local authority were entitled to demand. In his Lordship's opinion the resolution of February 12 and the subsequent proceedings were invalid, and the appeal must be allowed. Mr. Justice Ridley concurred. It was impossible not to see that the respondents were intending to apply one general rule in all cases. The resolution of February 12 referred to "all future cases," and mentioned the particular kind of water-closet that is to be used, and the notice served on the appellant was to the same effect. Although it might be most desirable that uniformity should prevail in these matters, still in this case the intention of the Act of Parliament had not been observed.

DILAPIDATIONS IN FARM BUILDINGS.—A special county-court was held at Bangor on two days of last week, when his Honour Judge Sir Horatio Lloyd and a jury heard a case which was of considerable interest to the farming community. Sir Henry Cunningham and Colonel G. W. H. Olive, the trustees under the will of the late Sir John Hay Williams, Bart., were the plaintiffs, and Hugh Williams, Bodrida, Llangaffo, Anglesey, was the defendant. Damages amounting to £78 were claimed by the plaintiffs for an alleged breach of the agreement signed by the defendant when he took the farm of Ty Fry, Pentraeth. It was alleged that the

damage had been caused by the neglect of the defendant to repair the buildings and the outhouses, the fences, walls, ditches, and drains, and the failure of the consumption on the farm of the hay and straw grown on the land. There was a counter-claim of £250 for two stacks of hay and one stack of straw, and also £67 2s. 7d. in respect of unexhausted improvements. For plaintiffs, Mr. J. Mason Parry, the agent for the estate in question, gave evidence of the damage caused, and stated that the incoming tenant came into possession on November 12, and witness made a list of the things which were out of repair. When cross-examined, however, the witness said he had lost the original memorandum of these things. He was the only man present when he took an inventory of the dilapidations. He had not put down the various items which made up the total claim, and he had not sent a detailed statement of the claims to the defendant. Mr. Walter B. C. Jones, land valuer and estate agent, Criecieth, said he visited the farm in April, 1897, and valued the total damages at £149, of which £75 was due to loss of manure. Cross-examined: The house was in a decayed condition, and for choice he would reconstruct the whole thing. Mr. R. Brooklebank, Plas Llandegfan, practically agreed with the figures of the previous witness. His total valuation was £150. Mr. Evan Evans, county surveyor of Carnarvon, said he had made a valuation of the damages caused by the tenant's neglect to patch up the house during his tenancy, and estimated it at £78 10s., and on account of the manurial loss £64. The house was in a very dilapidated state. Mr. Algeo, surveyor and valuer, Menai Bridge, gave his estimate of the total damage, with the exception of the manurial loss, to be £78 13s. Defendants said that when he left Ty Fry, Mr. Mason Parry pointed out the repairs which were to be done, and witness did all the things which were pointed out to him. Mr. R. G. Thomas, J.P., member of the Society of Architects, Menai Bridge, architect and valuer, said that £15 would cover the dilapidations charged against the defendant. What were now called dilapidations were, in his opinion, only ordinary wear and tear. The farmhouse had been built, and occupied for about 120 years as a family mansion, and it would be ridiculous to ask an ordinary farm tenant to keep it in repair when not more than half the house was used. His estimate of the dilapidations was based upon the principle that the materials for the repairs would be supplied, and that the tenant would have to find the labour. Mr. R. Gardner, Valley, gave evidence of a similar character. A number of adjoining farmers and workmen gave evidence as to the condition of the farm before and after the defendant came to the farm, and they said that the house and fences and ditches were equally good when he left as they were when he came there. The jury returned a verdict to the effect that they allowed a sum of £31 12s. to the plaintiffs for the manurial value of the hay and straw. As to the repairs to the buildings, the fences, and the ditches, they considered that the buildings had been left in as good repair as when the outgoing tenant took the farm. As to the counter-claim for unexhausted improvements, they found for the tenant in the sum of £19 10s., and for the tenant on account of the feeding stuffs to the extent of £46 7s. 11d.

LIABILITY FOR DAMAGE TO ROADS.—The House of Lords delivered judgment on Friday in the case of the "Kent County Council v. Lord Gerard," which raised the question who was liable to compensate the County Council for damages to roads by extraordinary traffic. Lord Gerard was rebuilding his mansion at Eastwell Park, and large quantities of building and other materials were hauled there by traction engines, considerable damage being done to the roads. The County Council claimed that Lord Gerard was liable, but he maintained that if anyone was liable it was the contractors. The magistrates before whom the case first came held the respondent was liable. The Quarter Sessions reversed this decision, but on appeal the Queen's Bench Division reversed the judgment of the Quarter Sessions, and again the Court of Appeal reversed the decision of the Queen's Bench. Their lordships affirmed the judgment of the Court of Appeal, holding that Lord Gerard was not liable.

BETHELL V. LONDON COUNTY COUNCIL.—ALLEGED FRAUDULENT MEASUREMENTS.—Before his Honour Judge Lumley Smith, Q.C., in the Westminster County-court, on Tuesday, this case came on for hearing. It appeared that the Works Department was carrying out the Lewisham sewer works, and shot 4,472 yards of earth on the plaintiff's land by her permission, and they paid her for 3,459 yards, or one-third less. She was not aware of this for some time afterwards. Frederick Horwood said he was confidential clerk to Mr. Holloway, the late manager of the Works Committee. He measured the earth placed on Mrs. Bethell's field, and it was then perfectly solid. There was a great deal of water in the workings and the men struck. After he and King, another officer of the Committee, measured, witness suggested to King "that as Mrs. Bethell did not know how much had been shot there, they

should deduct a third." At first King objected, but eventually agreed. His Honour: Am I to take it you suggested to him to cheat Mrs. Bethell? Witness: That is what it comes to as a matter of fact. His Honour: Is that not very disgraceful on your part? Witness: I did not think so, considering how the Council had treated me. I thought if it got through the Council and Mr. Wise, the acting manager, and passed the Committee, I should have exposed the Committee. His Honour: Then this was a trap for Wise? Witness: That is so, and the Council in general. Cross-examined: You were dismissed for signing bogus transfers? Witness: Yes; that was the reason given. In answer to further questions, the witness said he first had 30s. a week, and then 45s. a week. He considered "they all" fell into this trap, and he suggested that the Council themselves should have measured it. His Honour: Why, when they send a man whom they suppose to be honest, should they go and measure it? Albert Sydney Waterlow King, a surveyor employed by the Council, said the earth was loose, and the third was properly deducted. There was no truth in the statement made by Horwood of his falling in with his view to defraud the plaintiff. His Honour, in giving judgment for the defendants, said Mrs. Bethell was satisfied with what she received until Horwood had been discharged, and then he went to her, and in effect said: "I am a rogue, and when I gave you the measurements they were false and fraudulent." The claim should never have been brought. Defendants would have their costs.

CONTINUED DEFAULT UNDER THE LONDON BUILDING ACT.—At the South-Western Police Court on Tuesday Mr. J. L. Schiefer was summoned at the instance of the London County Council for having erected a building at the rear of Grove Mansions, Clapham Common, without a license from the Council, and after having been fined for this offence, had continued to make default. Mr. Chilvers, for the Council, said the defendant was fined 10s. in March last for erecting the building, and as he allowed the structure to remain, another summons was taken out against him for the recovery of cumulative penalties. This summons was dismissed, the magistrate being of opinion that proceedings had been taken out under the wrong section. The Council reconsidered the matter, and issued the present summons for continued default. Mr. W. R. Warren, for Mr. Schiefer, raised the question that the proceedings were illegal, for the reason that the summons had been taken out against the wrong person, the defendant having ceased to be the owner of the property. Mr. Chilvers said he was not asking for an order upon the defendant, but upon the Council, to enable them to go in and demolish the structure. Mr. Warren submitted that it would be monstrously unjust to punish a man for not doing what it was impossible for him to do. Then, again, if an order were made, it would be an injustice on the owner. Mr. Francis: I quite agree; but the section says nothing about that matter. Ultimately, the summons was adjourned, to consider the legal points raised.

WHAT IS A "NEW" DRAIN?—Mr. Chas. Whillier, a builder, and Mr. R. D. Duncan, a solicitor, were each summoned at Lambeth Police Court last week, by Mr. Julius Jones, a sanitary inspector in the service of the Lambeth Vestry, for having, at a house in Loughborough-street, Lambeth, in carrying out some drainage work, failed to comply with the regulations of the vestry. The house in question was formerly drained by an old brick drain, which became stopped up. Mr. Whillier, by the directions of Mr. Duncan, acting as solicitor to the owner of the premises, took away the old brick drain, and, on the channel taken by the old drain, put down a pipe drain. Mr. H. J. Smith, who supported the summonses on behalf of the vestry, argued that what had been done amounted to the construction of a new drain, and contended that the vestry were entitled to enforce compliance with their regulations relating to new drains, which require the fixing of an intercepting trap between the drain and the sewer, and the provision of inlet and outlet shafts. The point taken by Mr. Duncan was that this was a repair to an existing drain, and that the vestry were consequently not entitled to require the extra work to be done. Mr. Denman remarked that if a man took a spade and dug a hole in the field, and water flowed through it, it was a drain. If he bricked it over it was still a drain; if he took away the bricks and replaced them with pipes, it was still a drain—the same old drain altered and repaired, but not a new drain. A drain, it seemed to him, was the channel along which the drainage went. In this case he thought the drain was altered and repaired. The meaning conveyed to his mind by the word "drain" was the line or channel through which the drainage went. The old drain was there, the channel had not been altered, but it had been repaired and made better than it was before, although it did not comply with the requirements which the vestry were entitled to insist upon if it were a new drain, but which they were not entitled to insist upon if it were not a new

drain. The summonses would be dismissed, with £3 3s. costs against the vestry.

CARPENTERS AND JUBILEE SYNDICATES.—At Southwark Police-court last week, Mr. Fenwick heard the complaint of four carpenters, named Greenwood, Richards, Neal, and Griffin, against George Ashley and Co., of 133, Oxford-street, and the Mutual Jubilee Syndicate, Limited, of the same address, who were said to be jointly liable for unpaid wages earned in the erection of the Jubilee stand in front of St. Saviour's Cathedral. Mr. White, for the defendants, produced an agreement between the syndicate and a builder named Firbank, who, he said, contracted to do the work for £600, but only did part of it, and left both the syndicate and the workmen in the lurch. Mr. Fenwick said the men must be paid. Mr. Ashley had made himself liable by telling the men to go on working when Firbank had disappeared. Mr. White said the syndicate accepted the responsibility, and they paid all the men who attended on a certain day. The complainants replied that there was not enough money to go round. The magistrate then entered into a detailed examination of the men's claims, which were checked by the time-sheets and the evidence of a foreman named Bishop. In the result, Greenwood's claim of £3 7s. was dismissed, as he had been fully paid already; Richards, who claimed £7 13s., obtained an order for £4 14s., and 2s. costs; Neal, who claimed £3 3s., was allowed £3 17s., and 2s. costs; and Griffin, who demanded £5 14s. 9d., was awarded £4 4s. 6d., and 2s. costs. Mr. White undertook that the amounts should be paid without further delay.

HEAVY FAILURE OF AN OXFORD BUILDER.—Re Thomas Axtell, jun., builder, 17, Edith-road, Grand-pont, and 9A, St. Aldate-street. The Official Receiver, Mr. George Mallam, has issued observations with respect to this case, in which he states that the receiving order was made on the debtor's own petition. The debtor, a contractor and builder, commenced business in Oxford in March, 1893, with a capital of £300—which was borrowed. He soon commenced to undertake a number of contracts, and has been financed by his father, to whom he states he owes approximately £11,000. The debtor is unable to state the amount of his indebtedness, or the amount of his assets; but his clerk has supplied a list of creditors, which shows liabilities amounting to about £16,000, though this is probably not exhaustive. The debtor estimates his assets in preliminary examination at about £6,000. The Official Receiver added: "The confusion in the debtor's affairs caused by the fact that his books show neither his liabilities nor his assets nor his financial position on any one of his contracts is deplorable. I have to record the flagrant disregard of my orders to the bankrupt made in the interest of creditors. I cannot at present understand what has become of the considerable sums he has received during only four years' trading." The first meeting of creditors was held at the Golden Cross Hotel, Oxford, on the 23rd inst. The Official Receiver in the chair. It was reported that the debtor was ill in bed. A committee of inspection and a trustee were appointed, and the proceedings were adjourned.

A receiving order has been granted in the case of William Henry Clark, of College Park-terrace, Willesden, and Howard-road, Cricklewood, N.W., builder.

The Commissioners of Northern Lighthouses are inviting tenders for the erection of a light tower, engine-house for fog-signal, and dwelling-houses for the lightkeepers, on the Blackhead, a bold promontory about two miles and a half north of Portpatrick Harbour, on the west coast of Wigtownshire. The Blackhead will form an intermediary light between Corswall Point and the Mull of Galloway, while the light of Mew Island, near the Irish Coast, will be almost directly opposite. Four acres of ground have been secured at Killantringan, in connection with the proposed buildings.

A Bill has been passed for the construction of a line of railway along the north side of Loch Earn, and is entitled the Lochearnhead, St. Fillans, and Comrie Railway. When constructed it will complete the route from Dundee to Oban by uniting the Lochearnhead Railway with the Comrie Railway, and thus give a railway across Scotland from east to west.

Lord Norton being about to lay out his property in the neighbourhood of Cherrywood-road, Salfrey, Messrs. Wilmot, Fowler, and Wilmot, his surveyors, have submitted plans to the Birmingham Corporation for widening and improving that thoroughfare between Fordrough-lane and Denbigh-street. At present the road is of a very irregular width, some points being not more than ten yards wide. By the proposed arrangement, which has been approved by the corporation, the road will be made between the points named, of the uniform width of 14 yards. The estimated cost to the city of carrying out the work is £1,400.

WATER SUPPLY AND SANITARY MATTERS.

CHESTER.—Considerable progress has been made in the construction of the south side intercepting sewer, which is to serve the districts of Queen's Park, Handbridge, Curzon Park, Hough Green, and Lache-lane. Up to the present the sewage from these districts has had its outfall direct into the Dee, that from the first-named district entering the river directly under the weir. The scheme now in process of construction is designed to intercept the whole of this sewage, and deliver it into the intercepting sewer on the north side of the river, whence it will be conducted to the outfall works, and treated with the rest of the Chester sewage. The lift-house near the Old Dee Bridge is almost ready for the lifting machinery, which will consist of a 12H.P. turbine and a Woodford's pump, the power being obtained from the upper river water flowing along the old mill race. The pumping-well has two outfall pipes, 12in. in diameter, which run from here directly across the river parallel with the old bridge. At this point the two lines diverge—one to intercept Queen's Park and the junction for Handbridge, and the other for Curzon Park will intercept Greenway-street, Brown's-lane, the Cemetery, the Dingle, and Curzon Park sewers. The work is being carried out under the direct supervision of the city surveyor (Mr. I. Matthews Jones) by his staff of workmen. The pipes have been laid across the river, and the trench is open for 70 yards on the river bank going towards Curzon Park. In the course of three or four months the scheme will be an accomplished fact.

LIVERPOOL.—The members of the water committee of the Liverpool Corporation visited the Aubrey-street pumping-station on Friday, where the Lord Mayor formally started a new pumping-engine, built by Messrs. Hathorn, Davey, and Co., of Leeds. It is a three-cylinder triple expansion vertical rotating engine. It can be driven at various rates of speed to suit the varying demands for water, and there is also an arrangement by which it can be controlled by the rise and fall of the water in the high-level tank. The expenditure has been £5,640, which sum included all the alterations and the removal of the old engine. The Lord Mayor mentioned that the engine formed the completion of the works suggested by the water engineer, Mr. Parry. His estimate for these works was £149,100, but the actual sum expended had been £113,004. The Lord Mayor has also formally cut the first sod of the Conwy Tunnel works for the diversion of the river Conwy into Lake Vyrnwy, by which another million gallons of water a day will be provided for the city.

SALFORD AND ITS SEWERAGE DIFFICULTIES.—At the Salford County Court on Friday, Judge Parry had before him an adjourned application by the Mersey and Irwell Joint Committee for a peremptory order to compel the Salford Corporation to carry out a scheme for dealing with the effluent from their sewage filtration works. It was stated on behalf of the Corporation that a resolution had now been passed authorising the raising of money for completing the scheme. Mr. J. Corbett, the borough engineer, gave evidence as to what was proposed to be done, and as the result of a discussion, in which Mr. Sutton (who appeared for the Joint Committee), Mr. Caradoc Evans, the assistant town clerk of Salford, Mr. Corbett, and the Judge took part, it was arranged that the application should be adjourned, that the Corporation should proceed with the work, and that they should report as to its progress from time to time to the Joint Committee. It was understood that the scheme might be completed in two years.

CHIPS.

The Duchess of Teck visited Isleworth on Wednesday afternoon to lay the foundation-stone of a new isolation hospital for the joint use of the borough of Richmond, in Surrey, and the Heston-Isleworth District Council, in Middlesex.

Mr. Law has held a Local Government Board inquiry at Barnes in reference to the application of the urban district council for permission to borrow £1,600 for the acquisition of a site for workmen's dwellings and £450 for street improvements.

Mr. Cotton, chief engineering inspector, Local Government Board, has held an inquiry in the city hall, Dublin, touching an application made by the corporation for a loan of about £40,000, including £840 for altering and improving artisans' dwellings at Benburb-street; £1,000 for new meters for the public gas lamps, £7,000 for paving, £17,000 for repaving, £8,500 for flagging, and £5,500 for concreting.

The south window of the Lady Chapel in Winchester Cathedral is now being filled with painted glass, as a memorial to the late Bishop Thorold, whose grave is adjacent. The artist is Mr. C. E. Kempe. The window will be dedicated at three o'clock on Saturday in next week, when an address will be given by Bishop Barry.

Canon Moor, vicar of Gainsborough, on Wednesday in last week laid the foundation-stone of a new organ aisle and clergy vestry, to be added to the old Norman church of St. Peter's at Barton-on-Humber. The alterations, with new organ, will cost £2,000, towards which Mrs. Holt, widow of the late vicar, has given £1,000, besides a special donation of £250 for the restoration of the ancient oak chancel screen.

The Public Health (Scotland) Bill passed through the last stages of Committee in the House of Commons on Wednesday evening, and was read a third time the same evening amid cheers. The Bill contains about 200 clauses.

Herr Eduard Ritter von Engerth, late Director of the Imperial Picture Gallery at Vienna, died on Wednesday at Semmering, near Vienna, aged 79. He was a noted painter, one of his chief works being a picture of the Emperor Francis Joseph's coronation as King of Hungary.

The Duke of Cambridge has fixed October 18 as the date on which he will visit Bath to open the new pump-room and lay the foundation-stone of the Diamond Jubilee Art Gallery. Mr. J. M. Brydon, F.R.I.B.A., is the architect of both buildings.

The committee charged with the erection of the Civil War Soldiers' and Sailors' Monument, to be set up on a site in or near New York not yet determined upon, have invited Messrs. Richard H. Hunt, Gilbert, and Ward, W. H. Hume and Son, Stephen W. Dodge, Stoughton and Stoughton, and James E. Ware to submit competitive plans before September 1, with the understanding that the author of the best design is to be appointed architect of the work.

Messrs. R. Waygood and Co., Ltd., write us that they are informed that some of their competitors are calling on their customers, and circulating reports that, owing to the present unfortunate strike, they are unable to execute orders. They beg of us not to be misled by such reports, which are entirely without foundation, and hope their customers will not be influenced by such methods of endeavouring to obtain orders. We are sure that all who extend to them that confidence they have merited in the past will find that inquiries and orders will receive prompt and careful attention.

Alexandre Debelle, the landscapist and historical painter, who devoted his life to illustrating the Dauphiné, has died at Grenoble, at the age of 92. The son and nephew of soldiers who distinguished themselves under the First Republic, he was a pupil of the famous Baron Gros. He has left all his fortune to local charities.

The Birmingham City Council accepted, on Tuesday, a mace presented to the city by Messrs. Elkington, and agreed that the civic emblem should be placed in the art gallery for a few months in order that it may be inspected by the general public. An offer by Mr. W. H. Barber to present to the corporation a statue of her Majesty the Queen, by Thomas Brock, R.A., was gratefully accepted, and the public works committee were requested to confer with Mr. Barber, and suggest a suitable public site for the statue.

The new bridge across the Lee at Clapton was formally declared open for traffic on Wednesday by Mr. W. J. Bull, Chairman of the Bridges Committee of the London County Council. The new bridge is 32ft. wide, and is divided into two equal parts by a central girder, so that there will be two lines of traffic. The total cost of the work, which has been carried out from the designs of Sir A. Binnie, engineer to the London County Council, was £3,399.

The special committee of the Liverpool Corporation, who have in hand the taking over of the tramway system in that city, have decided to commence the improved system of haulage by establishing a service of cars the propelling force of which is to be electricity. The experimental line will be run by overhead communication. It is proposed to commence operations by a service from the city to the Dingle, and up Warwick-street to the Prince's Park gates.

Mr. Harley Hackford, assistant surveyor to the Whitechapel District Board of Works, has been appointed as surveyor to the St. Luke's Vestry.

The new Royal Baths at Harrogate, opened by the Duke of Cambridge on Friday last, have been built from plans by Messrs. Baggallay and Bristowe, of London, at a cost of £100,000. The principal contracts have been carried out as follows:—Masonry, brickwork, carpentry, and joinery, Mr. Isaac Gould, of Leeds; ironwork and plumbing, Messrs. H. Braithwaite and Co., of Leeds; plastering, Messrs. S. Johnson and Sons, of Mirfield; slating, Mr. Joseph Shepherd, of Harrogate; painting and decorating, Messrs. J. Pollard and Son, of Leeds.

The authorities at Gefle, in Sweden, have decided to build a new harbour, and to deepen and improve the access through the "fjord." The total cost is estimated at \$55,000 sterling.

Our Office Table.

THE Select Committee on the museums of the Science and Art Department have agreed on a second interim report. The report emphasises the original view taken by the committee as to the danger of fire in present circumstances, and urges the construction of the central buildings at South Kensington as soon as possible. It does not, however, deal with the administration of the Department, which will be the subject of future inquiry, and in regard to which there is much difference of opinion in the Committee.

The preliminary programme of the sixteenth congress of the Sanitary Institute, to be held in Leeds from September 14th to 18th, has now been issued. The president of the congress is Dr. Robert Farquharson, M.D. Edin., LL.D. Aberd., F.R.C.P. Lond., M.P., D.L., J.P. The congress will include three general addresses and lectures. Three sections will meet for two days each, dealing with (1) Sanitary Science and Preventive Medicine, presided over by Mr. T. Pridgin Teale, M.A., M.B. (Oxon), F.R.C.S., F.R.S., (2) Engineering and Architecture, presided over by Mr. Lewis Angell, M.Inst.C.E., F.R.I.B.A., (3) Chemistry, Meteorology, and Geology, presided over by Mr. Wm. Whitaker, B.A., F.G.S., F.R.S. Six special conferences:—River Pollution, presided over by Major Lamorock Flower, Sanitary Engineer, Lee Conservancy Board; Municipal Representatives, presided over by Councillor B. Womersley, chairman of the sanitary committee, Leeds City Council; Medical Officers of Health, presided over by Dr. Edward Seaton, M.D., F.R.C.P., F.C.S.; Municipal and County Engineers, presided over by Mr. Thomas Hewson, M.Inst.C.E.; Sanitary Inspectors, presided over by Dr. Peter Fyfe, F.R.S.E.; and Domestic Hygiene. In connection with the congress, a health exhibition of apparatus and appliances relating to health and domestic use will be held. Excursions to places of interest in connection with sanitation will be arranged as usual for those attending the congress. The local arrangements are in the hands of an influential local committee, presided over by the Right Hon. the Lord Mayor of Leeds, with Dr. J. Spottiswoode Cameron, M.D., B.Sc., Medical Officer of Health for the City, and Messrs. A. E. Pearson, M.R.C.P., L.R.C.P., and W. Spinks, Assoc. M.Inst.C.E., as honorary secretaries. According to the programme, over 300 authorities, including several county councils, have already appointed delegates to the congress, and, as there are also over 2,000 members and associates in the institute, there will probably be a large attendance in addition to the local members of the congress.

A GREATER BRISTOL will doubtless be an accomplished fact before Parliament rises, although the promoters of the scheme have only secured a portion of the extension at which they aimed. After a sitting extending over nine days, the Select Committee of the House of Commons concluded their inquiry on Friday into the Bill promoted by the Bristol Corporation for the extension of the city boundaries, by which, if conceded in its entirety, 7,880 acres, and a population of about 61,000, would have been added to the city, the present estimated population being 228,000. The committee decided that Bristol had established a case for the inclusion of the lower part of Horfield, St. George, and Stapleton. The Brislington boundary is modified and reduced, and Sned Park, Westbury-on-Trym, and Stoke Bishop are eliminated from the Bill. The additions sanctioned are entirely, it will be noted, on the north-eastern side of the city. The Bill had already passed the ordeal of a House of Lords committee.

MESSRS. MAXWELL AND TUKE, architects, of Manchester, who examined the tower and buildings of the Blackpool Tower Company after the recent fire on the summit, state that "no damage has been done to the main structure or entertainment portion of the buildings, the fire being confined simply to the three landings above the 380ft. platform, where certain woodwork has been destroyed, and where the heat fused the cables, causing the two balance weights which assist the hydraulic engines to raise the lifts to fall down their track inside one of the legs of the tower. The tower and buildings are in as stable a condition as when they were built." The tower and the group of buildings clustered around its base were erected in 1891-4, from Messrs. Maxwell

and Tuke's designs, at a total outlay of £300,000. The total height to the top of the flagstaff is 518ft. 9in., and to the crow's nest 480ft. The two independent lifts rose to the 380ft. level, whence staircases each 20ft. high led up to the platform below the crow's nest, which was reached by an iron ladder. The disaster is attributed to the cables that conveyed the electric current to the arc lights on the balconies becoming fused and setting fire to the adjoining wood casing.

MR. LAWSON TAIT has patented a new form of kitchen-range, of which the principal object is the prevention of smoke, and consequently of waste. When chairman of the Health Committee of the Birmingham City Council, Mr. Tait was much impressed by the pollution of the atmosphere by the smoke from kitchen fires, and for several years he has been at work in the endeavour to perfect a cooking-range which shall be free from the objection of wasting coal and producing smoke. He believes he has now succeeded, and has exhibited the result of his work to a number of interested persons at 195, Newhall-street, Birmingham. Mr. Tait's kitchener is a self-contained structure of iron, requiring no brickwork flues. The fire is wholly inclosed, and is arranged upon sharply-inclined bars, coal being fed from the top of the slope. This principle has been adopted in various furnaces; but Mr. Tait adds to it the feeding of air at the point of combustion through a tube forming part of the structure of the oven, and which, becoming heated, gives a hot-air blast, and secures complete combustion. The kitchener has two ovens and a tubular water-heater. The inventor claims for it that it will do its work with one-eighth the quantity of fuel required for a range of corresponding dimensions of the ordinary type.

THE Vestry of St. Mary, Newington, has adopted the artesian-well system to supply the extensive and commodious public baths and washhouses recently erected by them at Manor-place, Walworth-road with the large amount of water required daily. One of the two wells which it was found necessary to bore has been already completed by the contractors, Messrs. Neill and Booth, to a depth of 352ft. On testing the supply of water at this depth, it was found to be fully 5,000 gallons per hour. The water is fairly soft in character, and will prove a good water for steam-boiler and laundry purposes. It comes from the flinty chalk, and its purity is assured by a thick overlying stratum of clay, through which no surface-water can penetrate. Why on earth more people in London do not follow the example of the Newington Vestry, in the face of the rapacity and unreliableness of the water companies, we cannot imagine.

THE congress at Bristol of the National Master Builders' Association was brought to a close, as we briefly intimated in our last issue, p. 103, by a visit to Bath on Thursday in last week. The visitors left Bristol at 10 a.m., arriving at the Bath G.W.R. station at 10.18, where a deputation from the Bath Master Builders' Association, including Mr. E. W. Wooster (the president) and others, received them, and subsequently conducted the company over the Roman bath and the bathing establishment, the Abbey and Municipal Buildings being also visited. Light refreshments having been partaken of, a start was made for Box, a number of four-horse brakes having been chartered for the journey. The usual route was departed from, for the benefit of those unacquainted with the architectural and other beauties of Bath, and a drive was taken through Queen-square and the Victoria Park, thus affording a capital view of the Royal crescent, circus, and assembly-rooms, before entering upon the London-road. The city having been left behind, Rudloe Firs, Box Hill, some eight miles out, was the rendezvous, and here the party were received and entertained at luncheon by the directors of the Bath Stone Firms, Limited. There was a short and informal toast list, that of "The Bath Stone Firms," proposed by the President of the National Association, being received with much enthusiasm. Mr. George Hancock, managing director of the company, responded, and spoke in terms of admiration of the aims and objects of the association. Bath was reached about 7 p.m. The banquet, which was subsequently given at the Guildhall by the local association, was a great success, upwards of 100 sitting down.

THE Incorporated Society of Medical Officers of Health held their provincial meeting in Bristol on Saturday at the invitation of the West of

England and South Wales branch. The members assembled at the Guildhall, where they were officially received by the Mayor (Alderman R. H. Symes). At the business meeting which followed, Dr. Bond, of Gloucester, occupied the chair as president of the local branch. The proceedings were of a private character. In the afternoon, Alderman C. W. Cope-Proctor, chairman of the Bristol Sanitary Committee, entertained the members attending the conference, and his colleagues on the committee, at luncheon at the Council House. Subsequently, the company proceeded to Ham Green, where they inspected the fever hospital, under the guidance of Dr. D. S. Davies.

THE distribution of prizes gained by the students of the Royal College of Art took place on Wednesday in the lecture theatre of South Kensington Museum. The report of the principal, Mr. J. C. L. Sparkes, stated that the students of the college, in the national and local competitions, and in examinations in 1896, had gained three gold, 39 silver, and 104 bronze medals, 148 National competition books, and 36 Queen's prizes. Since the commencement 28,633 students had passed through the various classes in the school. Sir Wyke Bayliss, addressing the students prior to distributing the prizes, said it was for them to fulfil all that their fathers had failed to accomplish in the field of art—to make the old paths broader and safer, and to discover new ones. The artist of to-day had two things to fight against—despondency and conceit. The true artist was always trying and always failing, for beyond his highest achievements there always lay a still higher aspiration. Art was a living and a growing force. They need have no fear of heresy among their ranks, for its effect was in the end purifying. Finally, he exhorted them to study the accumulated wisdom of the centuries, and to base their own knowledge upon a personal study of art.

A GENERAL meeting of the members of the Photographic Survey of Warwickshire was held on Friday night in Birmingham, Sir Benjamin Stone, M.P., presiding. Mr. C. J. Fowler, one of the hon. secretaries, submitted the draft by-laws which had been drawn up by the council. These provided that photographs must be printed in carbon platinum or bromide, and be deposited, unmounted, with the curator, who would have them uniformly mounted upon the official mounts provided for the purpose; and that for the sake of uniformity whole-plate ($8\frac{1}{2}$ by $6\frac{1}{2}$) should be regarded as the standard size for photographs. Two or more prints of a smaller size might be placed on one mount, but enlargements beyond whole-plate were not recommended. On the proposition of the chairman, the by-laws were approved. It was resolved, on the motion of the chairman, that there should be a further exhibition of Warwickshire photographs at the Birmingham Art Gallery as soon after October 1 as could be arranged with the authorities.

By order of the Secretary of the United States Treasury, the design of public buildings is thrown open to competition among American architects, in accordance with the provisions of the Tarsney Act of 1893. Under the new regulations information as to cost and general requirements of buildings placed in competition will be furnished by the supervising architect of the Treasury Department at Washington, who will also depute a superintendent of construction, or clerk of works, for each building; but the designing of the structure, and the general superintendence, will be intrusted to such of the competing architects as may be selected, and he will be paid for this service a fee of 5 per cent. on the amount expended on the building up to 500,000dol., $3\frac{1}{2}$ per cent. on the next 500,000dol., or any part thereof; and $2\frac{1}{2}$ per cent. on any excess beyond 1,000,000dol. The competing designs will be examined by a commission, consisting of the supervising architect and two other architects or experts in construction, who will report their conclusions to the secretary of the treasury; but the right is reserved to reject any or all plans. The first buildings to be designed under the new regulations are those at Norfolk, Va., and Camden, N.J. Among the buildings which may possibly be opened later to competition is the new Philadelphia Mint; although designs have been prepared for this building in the office of the supervising architect; they have not been satisfactory to Philadelphia people. At present competition will be restricted to architects invited by the secretary of the Treasury, who is, in each case,

to call upon at least five members of the profession in good standing to submit designs.

The Goldsmiths' Institute Building Construction Classes have obtained an exceptionally good report on the result of the recent May examination. Forty-one students sat for the elementary examination, and of these 24 are recorded as having "passed," while eight have obtained a "fair" mark. In the advanced stage, every student has passed, five obtaining first-class, and 19 obtaining second-class certificates. Two students of this institute have gained second-class certificates in honours. The carpentry classes have also gained distinction, all those who sat for honours having gained second class certificates, whilst two of these students recently obtained silver medals from the Carpenters' Company, and another has gained a first-class certificate at the same examination.

CHIPS.

Mr. John Phillips, C.E., late surveyor to the Metropolitan Commissioners of Sewers, died on Wednesday, the 21st, at his residence, 25, Disraeli-road, Putney, in his 81st year.

A public inquiry has been held at Pembroke, before Mr. Rienzi Walton, M.I.C.E., concerning the application of the town council for sanction to borrow £23,000 for the execution of amended schemes for the sewerage of the borough.

A joint committee representing the London, Brighton, and South Coast Railway Company, the Seaford Urban Council, the Newhaven Rural Council, and the various landowners whose property abuts on the Buckle-road, Seaford Bay, met at the County Hall, Lewes, on Monday, for the purpose of considering a report by Mr. E. B. Ellice-Clarke, on sea defence work along the foreshore of Seaford Bay. It was decided to take steps to carry out the works recommended by Mr. Ellice-Clarke.

A new church of St. Paul, with schools attached, is about to be built at Blackpool, from designs by Messrs. Garlick and Sykes.

The South-Eastern Railway Company having intimated to Mr. Cumming Macdonald that they are prepared to arrange for a station at or near Jamaica-road, so that their proposed loop-line may give his constituents better access to the City, the country, and the seaside, the member for Rotherhithe has withdrawn his opposition to the Bill now before Parliament authorising the construction of the said line.

Messrs. Roscoe and Lumb, who have examined the Hermite process rather closely, report that whilst complete sterilisation of sewage by the Hermite process is not practicable, deodorisation is easily obtained by the weaker solutions; and that whilst the stronger solutions of the electrolised seawater are very unstable, and soon lose their deodorising properties, the weaker solutions are fairly stable. This process has been experimentally used at Lytham and Ipswich; it is also in successful operation at Netley Hospital, Southampton, and a fairly large plant is about to be put in operation at Bombay.

New Roman Catholic day-schools, erected at a cost of £4,000, were opened at Batley on Sunday by the Right Rev. W. Gordon, Bishop of Leeds.

In the House of Lords on Tuesday, the White-chapel and Bow Railway Bill, which had already passed successfully through the House of Commons, passed the committee presided over by Lord Morley without opposition. The object of the measure is to incorporate a company for making railways from junctions with the Metropolitan District Railway at Whitechapel to a junction with the London, Tilbury, and Southend Railway at Bromley, the railway to be worked by steam-power or electricity.

Mr. H. A. Poyser cut, on Monday, the sod for a new church to be erected at Rhosrobin, a mining district near Wrexham. The church will cost about £1,300, and will be erected on a site kindly given by Sir Watkin Williams Wynn.

The Dowager Lady Tweedmouth laid, on Monday, the foundation-stone of a memorial chapel which she is having erected at the Northern Infirmary, Inverness, in remembrance of her late husband.

Since the failure of the Embabeh bridge the subject of railway-bridge building in Egypt has been brought prominently before the authorities. It has been stated that the acceptance of a tender from a French firm which was not much more than one-half that of the English competing firm was a mistake, as a properly constructed work could not be made for the sum demanded—viz. £81,200. This statement seems to be well supported by the fact that £33,000 have now to be expended in strengthening the bridge in question. But even then, as Lord Cromer points out, the sum will not equal that asked by the English tendering firm—viz., £138,000.

Business was very brisk at the Mart last week, although some of the larger estates failed to find purchasers. The sales for the week, as registered at the Estate Exchange, amounted to £264,817 as against £189,067 recorded for the corresponding week of 1896. The amount, moreover, of Messrs. Edwin Fox and Bousfield's sale must also be taken into account, bringing the grand total to over £300,000.

At the Council House, Bristol, a Local Government inquiry was held, on Friday, by Mr. Rienzi Walton, M.I.C.E., the Bristol Town Council having applied for powers to borrow £58,000 for the purposes of streets improvements, and £7,060 for the provision of public baths.

Mr. Hippolyte Blanc, R.S.A., architect, has received instructions from the cathedral committee of the commissioners of the burgh of Kirkwall to visit and report upon St. Magnus Cathedral there with a view to carrying out some long-desired improvements.

The City Commissioners of Sewers decided on Tuesday to offer no opposition to an application from the Central London Railway Company for permission to proceed with the public staircases at the corner of Walbrook and Queen Victoria-street.

The statue of Joan of Arc, by Paul Dubois, exhibited in the Salon of 1895, is about to be erected at Paris in the centre of the Place des Petits Peres, opposite the Church of Notre Dame des Victoires.

At the last meeting of the Holywell Rural District Council plans were submitted of the water supply which Sir Pyers Mostyn, Bart., of Talacre, is giving to the village of Gwespyr as a memorial of the Diamond Jubilee. Sir Pyers will make and maintain the works, which will include a tank with a capacity of 17,000 gal. The plans were approved.

A special service was held at the Central Synagogue, Great Portland-street, on Sunday, on the occasion of the unveiling of three windows to the memory of the late Mr. Lionel Louis Cohen, M.P. The central of the three windows bears an inscription surrounding the armorial bearings of deceased.

The town of Ashton-in-Makerfield was on holiday on Saturday when Lord and Lady Gerard drove over to lay the foundation-stone of the new Record mill at Ashton Heath. The mill is for 3,000 ring spindles, and will be three stories high. It will be lighted by electricity. It is 283ft. long and 136ft. in width. Lady Gerard subsequently drove to Wigan-road and declared open two small parks and recreation grounds on either side of the road.

Madame Patti laid the memorial stone of a new theatre at Swansea on Monday afternoon. Mr. William Hope, of Newcastle-on-Tyne, is the architect.

The Duke of Devonshire will formally inaugurate the new water supply for Eastbourne on Friday in next week, August 6. The works, which have been completed this week, have been carried out by Messrs. John Aird and Sons.

The Birmingham City Council have decided to carry out the first section of a widening of Bull-street, at an estimated cost of about £30,000. A larger scheme was submitted in February last, but was rejected, on account of the outlay involved, about £85,000.

A new school is to be erected at Nanpean, St. Stephen's-in-Branwell, from designs by Mr. Sampson Hill, architect, Redruth.

The new electric tramway from Roundhay Park to Kirkstall Abbey, a distance of seven miles, will be opened next week. The works have been carried out for the Leeds Corporation under the direction of Mr. Talbot, representing Dr. Hopkinson, F.R.S., the consulting engineer.

Tenders for the work of constructing the proposed new Congregational church in the North-West Ward at Scarborough have been accepted. The church alone will be proceeded with at present. The initial seating accommodation will be for 500 worshippers.

The Holden memorial wing of the Rochdale Infirmary was opened on Saturday by Lord Stanley, M.P.

Through failing health, Mr. J. C. Horsley, R.A., has been compelled to resign the position of treasurer to the Royal Academy, which he has held for many years.

Princess Frederica of Hanover visited South Mersham, Surrey, on Monday, and laid the foundation-stone of the new church of All Saints. The estimated cost of the church is £3,000, and towards this £1,200 has been subscribed.

The patronal festival of St. James's Church, Handsworth, on Sunday, was marked by the dedication of a stained-glass window. The window was designed and executed by Mr. T. W. Camm, of Smethwick. The work is in harmony with that of the fifteenth century, and the subject treated is the appearance of the angel Gabriel unto Zacharias.

THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2222.

FRIDAY, AUGUST 6, 1897.

DECORATIVE VALUE OF MATERIALS.

WITH much truth Ruskin says: "Take most pains with the best materials. Never waste pains on bad ground; let it remain rough, though looked after and cared for." This principle may be usefully applied to building materials. The commonest of them are developed and elaborated to a superfluous degree, as in those fabrics which for their cheapness have pushed their way into notice. With our surplussage of new materials there seems to be a danger of neglecting those which have the most intrinsic value for substitutes of an inferior quality, and we see this in the treatment of building stones. We have a number of very beautiful natural products—sandstones, and limestones, to say nothing of clay goods—which are neglected because of the extra labour necessary in their use or decoration, and because it is easier and cheaper to carve a soft limestone than to carve granite or a hard sandstone. Ornament, not goodness of material, is at the root. The proper use of materials in a physical and technical sense is absolutely essential. We should condemn any architect who specified a soft limestone in a smoky moist atmosphere, or used inferior Swedish timber for exposed woodwork. We expect him to use the straight-grained and strongest-fibred timber for roofs and joists which have to stand stress and heavy loading, and to use the lighter and less durable for internal work exempt from strains; and for external stonework we naturally expect him to provide harder and a more durable stone than he would do for internal work and carving. Beyond these requirements there is the decorative value of materials, and for which another set of conditions appear to be necessary. For instance, an architect may be quite justified in using a grey granite for a part of a façade exposed to rough usage, though for decorative effect a warm-coloured sandstone would have looked better; but the latter is much less durable. In making up his mind he has to weigh well which of the requirements is the most pressing—durability or appearance. If the building was going to be erected in a smoky town like Birmingham or Manchester, where damp and acids are both active agents in the disintegration of stone, the latter qualification should take a second place. Any amount of decorative effect produced by using stones of warm colour and of easy working would be sacrificed where smoke soon discoloured. How short-lived would be the effect of two or three materials of different tints; how soon begrimed with black the sculptured frieze or carved bands; and how brief the pleasure derived from marble medallions or panels, or a band of glazed tiles. If all this decorative detail is to be covered with a film of dirt and soot, so that its beauty will be lost, there will be little to choose between a grey granite front, too dressed, and the rich inlaid front; while the greater durability of the granite will give it a claim to adoption. These are points which have to be taken into our view in determining whether durability or decorative effect is to be preferred. It is amazing to see with what indifference the ordinary professional mind uses materials. He introduces polished red or Peterhead granite columns into his white stone front, slabs of polished granite cover up his iron stanchions of the shop-front; and his vestibules and

interior are covered with "art faience," polished mahogany, or embossed plaster. It never once occurs to him whether his outside granite or stone is in harmony with these lighter fabrics. Many of our new buildings illustrate this heterogeneous mixture of materials.

In London the chief materials employed by architects for external use are stone, granite, marble, brick, and terracotta. But it cannot be said these are generally used intelligently or with any appreciation of their physical or decorative qualities. We see a building all brick, or all terracotta or stone, just which material happens to be selected or which the architect knows most about. Apart from moulded, or carved, or modelled, work, there is nothing to give any decorative value to the material by way of contrast, and when the smoke and grime of London atmosphere has toned down the whole façade, there is little to choose between them. All are reduced to the same dull monotone of grey. Take any dozen buildings in the City or West-End, in which these materials are employed; a dull grey, or drab, and reddish brown are the only colours discernible, the fresh-painted houses and the newly-built brick and stone fronts excepted. The stucco painted front can put on a periodical garb of cleanliness and brightness, and now and then we see a brick front coloured and re-pointed, giving it an air of freshness; but these refacings do not last long—a dingy coating of dirt and smoke soon obscures the tints or shades of colour that have been put on, and the short duration of the painted front, in London at least, makes it a very undesirable substitute for more lasting materials.

Taking brick and stone as the materials which the architect commonly uses, we may wonder how little has been done to make them decorative. The sombre effect of smoke and age very soon robs them of their brightness, and reduces them to a dull drab. Brick buildings, with bands and dressings of stone, are common enough; but in a few years the stone becomes black or grey, and the red a dull brown or dingy black. Artistically, the toning down is an improvement, for the spotty effect of red brick and stone dressings is certainly not pleasing. Hampton Court, Chelsea Hospital, and many of the old houses and edifices of the Georgian era to be seen in various suburbs of London are examples of the agreeable tones which these two materials assume when left alone. But they can hardly be called decorative in any special sense from the architect's point of view, though from the painter of landscape and the pictorial artist nothing is more charming to the eye as a pleasing contrast of colour than an old red-brick manor-house or country mansion peering between masses of green foliage, or standing in its own park. It is in this wider sense also that we speak of the decorative value of materials—namely, the contrasting effects produced by stone and brick buildings with their surroundings.

But the decorative value of materials may be regarded in another light, and a more architectural sense—we mean the contrast afforded by the relation of one material to another in the same building, and the treatment of each decoratively. Have we not means of contrast, in red and white Mansfield, or red Corsehill stone, light yellow or brown Whitby, the Derbyshire, and other sandstones within reach? We see every day buildings in which two or three different materials are mixed together without any definite meaning. Structural and decorative feature are confused: one may be of stone, another of brick. We see a window-dressing here of stone, and there one of brick, though both may be of the same importance. Cornices, stringcourses, and window-sills are of stone, and we notice panels carved with ornament of the same stone somewhere else.

In the prominent parts, as well as in the retired planes, we see the stone used. But this is not the worst fault. In all this mixture of stone and brick there is no attempt to make the most of the materials in an ornamental sense, or to say, "I shall use the stone in all the architectural features, and the red brick in the minor surfaces," or arrange the two decoratively. So our brick and stone buildings are very uninteresting directly their freshness wears off. Then we have buildings of stock and red brick—most of our London School Board buildings are of this class. Many of them have got dingy and sombre; but the two materials combine well together when used with moderation. Red gauged brick arches, courses, and quoins give relief to the stock brick wall faces; but we think the fault in most work of this kind is a spottiness of effect, an even distribution of the two colours without any decorative value. It would be much better if the red brickwork was used in certain portions of the building, and the stock brickwork in other parts—say, red brick in ground story, and the upper stories of the stock brick, but with window-dressings of red to carry the same colour through. This would be more decorative than to use stock brick in the whole of the walling and red brick in the dressings. In a market with open arches in the lower story, the red brickwork could be used throughout the piers and arches, and above the light brickwork with simple dressings in the darker material. The new baths in Kennington-road show an excellent brick contrast of red facings and gauged work in dressings.

Passing to brick and terracotta much the same rule applies. The chief mistake is to employ it in a scattered way over the front in cornices, string-courses, bands of ornament and dressings with brick between in the manner most stone dressings are done. A disjointed effect is produced, and the bands or courses are often very rough and unpleasant to the eye. The better way is to employ the terracotta in a whole part of the building, say the ground story, the material appearing again in the main windows and features above; or, say, let the terracotta be employed in the entrance porch or in an angle tower or a bay window. The work is then all aligned in proper courses, and a decorative effect is produced.

A few buildings show this employment of material in the mass. The new Metropole Hotel at Folkestone has its ground story or basement throughout of the Burmantofts terracotta, and dark red brickwork from Tunbridge Wells in the upper portion of the building. A few examples in Regent-street and Oxford-street may be noticed as in Messrs. Redfern's premises, Conduit-street, where a porch vestibule of shop-front has been entirely constructed of terracotta. Another admirable example of this treatment is seen in some recently-built premises in Parliament-street, one of the most refined and artistically-finished fronts of brick and terracotta to be seen in London. Both in the delicacy of the arch members and ornamental details modelled in terracotta, and the general design of the building, the architect has shown how these materials can be combined with effect. Those who want to see how these two materials are used together in a whole street may make a tour of inspection through the rebuilt streets like Surrey- and Arundel-streets, which lead from the Strand to the Embankment. Both the modes of combining the two materials may be seen here—we do not say always successfully. The elaborate front of the School Board Offices loses much of its effect from the want of breadth of plain surfaces; the ornamental detail, instead of being confined to certain parts like the window bays, is too intermixed. At the corner of Arundel-street Messrs. Smith's premises show a reasonable combination: the recessed window bays are in terracotta

between piers of brickwork. In Sloane-street and Hans-place these two materials have been largely used together, and here and there one may find a decorative effect obtained by simple means.

Granites and marbles are important architectural materials; but how little architects have done to show their decorative value! We see a basement or ground story executed in polished grey granite, above is an ordinary stone or brick building. Granite, when used in the lump in this way, is seldom successful. In many of the newer City offices and shops we see granite used for pilasters or piers between the windows, very durable and effective, but without any relief of colour or contrast. In Aberdeen or Glasgow we may see how these hard materials have been used with effect and decorative value as in buildings designed by the late Thomson in the Neo-Grec style. The combination of dressings of different tints like blue and brown, as, for instance, the darker polished granite for pilasters, and the redder or lighter varieties for the walls or jambs of windows, may be adopted, as it has been done in a few City buildings, and a few in Westminster Bridge-road and Oxford-street. The various colours found in Devonshire and Irish marbles from red to blue and green and black, offer architects a mode of decoration of which they have not made much. Thus from Galway come some beautiful green marbles, and from Cork several varieties of red and grey, and from Plymouth many very charming varieties from delicate greys or lilac tints to rich brown and rose-red hues, many spangled marbles in which veins of black and pink, grey and dove, and yellow diversify the surface. These very beautiful marbles are of less price than the Italian varieties, and have been sent to all parts, Italy, Africa, and India, and are supplied in slabs of 1 in. to 1½ in. thick, polished on one face suitable for wall decorations and interiors, also in blocks and shafts for columns. If they can stand the atmospheres of cities like Birmingham and Leeds, they will do anywhere. In treating these granites and marbles, the modes of finishing their surfaces ought to be considered;—thus they may be sanded or have a polished face, be rough or fine axed, or “finely emiered”—a source of decorative effect which can be inexpensively employed.

Of late years coloured faïences have been introduced; but how few examples of successful decoration can be pointed to! We have one instance of an open loggia to a restaurant in the Strand, in which a yellowish glazed faïence has been employed successfully. For colour contrasts the material is excellent; but many of the applications we see have failed, because the architect has not studied a scheme of decoration. The failure has been due to over-elaboration and enrichment, instead of relying mainly on broad flat surfaces of one or two tints of broken quality. One or two designs, at the National Competition Exhibition at South Kensington for interior decoration applied to a music-room and to other purposes, show the right decorative treatment of this material. Might not many of our streets and interior vestibules and halls be made to contribute colour at once decorative and restful by glazed faïence of quiet shades of green and yellow, in the name fascias, arcading, and spandrels of shops and offices, and in the surfaces of interior walls? We do not mean elaborate patterns or painted and glazed pictures of the so-called “art faïence” make, but a scheme of colour gradation arranged architecturally as a wall treatment. The frittered and piecemeal distribution of the choicer materials, whether it be gauged brickwork, stone, terracotta, or marble, destroys all decorative breadth, and is the cause of failure of most of our façades; the same quantity in main features and broad surfaces imparts grace and beauty.

NATIONAL COMPETITION OF SCHOOLS OF ART DESIGNS.

IN the practical qualities of architectural design, the drawings exhibited at the National Competition at South Kensington are inferior to those of the last year or two. Two gold medals have been awarded for designs for buildings—one for a provincial market by James A. Swan, of Birmingham, and another for a memorial chapel by George A. Paterson, of Glasgow. We have seen the design for the provincial market before. It is shown by an able set of drawings, marked by some freshness and a masterly treatment of details. The plan shows a parallelogram longitudinally divided into three bays or avenues divided by open arches and pillars with two open sides, and of five bays in length for standings, and a hall or assembly-room above 8 ft. 6 in. by 3 ft., with offices at the end and a projecting stair on one side leading to the assembly-hall. The roof is high-pitched, with *niche*, and the upper story is pierced by mullioned windows, the whole in a Late Gothic style, of which the author shows himself to be an expert. The large detail of window-bay exhibits a free and clever treatment; the section of roof is also carefully designed; the coloured perspective is an effective drawing. The Memorial Chapel, by George A. Paterson, is of dignified monumental character in a Greco-Egyptian style, planned as a Greek cross, the arm on the left for the monument, that on the right for vestries, and the eastern arm for choir and altar, and a vestibule at the west end. The cross has a large circular area, seated in the centre, with ambulatories. A low dome crosses this part. Columns of the Corinthian order standing upon a spacious stylobate surround the central naos, and the entrance doorway is in this lower part, to which a flight of steps flanked by columns or balustrades lead. The details on a large scale show the coloured and bronze decorations. The author's work is characterised by a true Greek feeling, and clean, firmly-drawn elevations are sent. Several drawings receive silver medals. Another Glasgow Corporation student, Donald M. Stoddart, sends a design for a small art department. This scheme is Classic in design, with a domed square central compartment approached by a handsome flight of steps, having side-wings for paintings, also library and reading-room. A lecture-theatre is shown behind. Recessed Corinthian columns adorn the side wings. There is a heaviness of outline and detail, and the lighting does not appear to be sufficient. James McKissack, of the Glasgow Technical College, sends also a design for a museum and art gallery. The plan is rectangular, divided into galleries *en suite*, with picture galleries over. The building is designed in an Italian Renaissance manner, with angle cupolas and a centre dome. The details are poor, especially the windows and outline of dome. We cannot admire the design for a monument by Donald M. Stoddart, which takes a silver medal. It looks like an unfinished Gothic tower, and poor at that, with canopied figures at top and an open flat arch for the reception of the principal statue.

We next come to the bronze medal book prize designs. These are numerous, and include a few works of considerable merit, especially in the designs of a decorative character. First we notice buildings. Alexander M. Gardner, of the Glasgow School of Art, sends a design for an art department of a university, an elaborated Italian design, with centre dome, spoiled by groups of figure sculpture, and of a very poor profile. Andrew Roll, of the same school, wins a bronze medal for the same subject, also defective in its external proportions, and wide portico. The drawings are scarcely up to the mark. The design for chapter-house—we suppose the subject is given because it brings into

play the skill of the student for a constructional Gothic exercise—by J. A. T. Houston, of Glasgow, is an extraordinary example of misapplied architectural knowledge. The author shows prodigious flying buttresses of the heaviest kind; the *arcs boutant* are richly traceried with buttresses of unnecessary proportions, and the details of construction not shown. But why give the subject to a student who has not mastered the elementary principles of the art? James Christie, of the same school, sends a preferable design; but the pinnacles which surmount buttresses at corners of octagon are extravagantly large. The same medal also goes to a design for a palatial club-house, Italian Renaissance, with clever details, but poor proportions and plan. A book prize is given to H. Henderson, Leeds, for a design for an institute—a well-grouped building in a free style for architecture and the arts, accompanied by an ably-drawn perspective, which deserves a higher award, and the same student's design for a village inn is also artistically treated. The same prize is won by E. Brain, of Longton (Art Class) for a country church, very simply and well treated with low tower, shown by a nice drawing. W. M. Carter, York, also creditably wins this prize for a country vicarage in a Late Gothic style, adapted to a stone district, the walling in “scutch” faced, hammer-dressed, random courses. The plan shows a large, projecting parish room, and the design is picturesquely handled, and deserves a higher place. We also notice a cemetery chapel design, and a very pleasing, quaintly-treated design for wayside inn, with half-timber and red-tile roof, by F. W. B. Yorke, of Oldbury. The same prize is given for a country house, heavy and poor in design and detail, with a plan by a novice. Who is responsible? An ambitious design for a cathedral, by H. Swanwick, Leeds, receives a book prize, though we are unable to see on what ground the award is justified. It is a Late quasi-Gothic style with segmental and pointed windows to nave and aisles, and ill-designed tracery. The central tower is storied with a cupola finish, and two other towers and spires are at the west end. The whole is devoid of feeling, and the detail is bad, as is the design of the vaulting. McGrath's design for a gate entrance is classic, and neatly executed with ink perspective.

We note a few designs for wrought iron-work. A bronze medal is given to G. Howard, of Putney, for terrace railing, and a book prize to V. A. Lawes, Warminster, for wrought-iron gates, which are rather crowded. A bronze medal is won by T. D. Bryan, of Bristol, for a pair of entrance gates treated with some skill, and a book prize goes to R. Eccles, Manchester, for a gate treatment of some merit; but on the whole the designs do not show any intelligent appreciation of smithery. In the designs for artistic metal-work a silver medal is awarded to Agnes Kershaw, Sheffield, for designs for electric-light pendants and brackets, which show some merit in adaptation and form, and a bronze medal to P. Connard, of the Royal College of Art, for a design for pendant, in which elegance and lightness are qualities.

Amongst other designs of a decorative character we may notice Herbert D. Richter's (Bath), design for a cigar cabinet and panel, for which bronze medals have been awarded. The former is a clever design, refined in treatment and detail. A silver medal for stained-wood hanging cabinet for books is awarded to W. F. Blagg, Chelsea, well treated, with a figure-subject in panel, the design and colour of which are very creditable. A bronze medal is also given to F. R. Wilkins, of the same school, for a panel design based on the poppy. One of the few high-class designs for decoration intended for a music-room is by Henry E. Crocket, of the Training Class, which receives a silver medal. The fireplace is

painted with figure-panels of a refined and suitable character, and there is much taste shown in the treatment of the panelling. The same award is given to James B. Fulton, Glasgow, for a screen in chapel of rich traceried design, and of Late Gothic. A design for a hall fireplace by W. S. Moyes, Glasgow Technical College Art Class, shows breadth and a sensible treatment. Arthur O. Carter's design for decoration of an assembly-hall, which receives a bronze medal, is very meritorious, and the silver medal design for the decoration of a Turkish bath by Alfred Cumber is worth notice for the choice and spirited treatment in terracotta, glass, and mosaic in dome and spandrels, and the glazed faience decoration.

A design for a piano front, an oak screen and mantel, receives a gold medal, and is by George Montague Ellwood, of Holloway School, in which an artistic treatment of materials is shown on the drawings. The decorations of mantels consist partly of gesso ornament and wrought-iron fittings. The piano front has panel in relief of St. Cecilia and other subjects, these being in gesso. A clever perspective sketch in ink for oak over-door of music-room having six gesso panels is sent. Pillars of oak support the overdoor, and have copper bracket capitals, and the design shows freshness and originality of treatment. A fire-screen in oak with stained wood and gesso-work panels, copper, and side-leaves is pleasing and unique in design, and shows much ingenuity and taste. We may refer to the time exercises worked at local examinations in art. One of these is a pencil sketch of one bay of choir of St. Saviour's, Southwark, showing details done in four hours. Another is an architectural design made in three days of end of church with staircase turret, but in a questionable style of Gothic. A third drawing shows a timber roof. These time sketches are a useful mode of bringing out the candidate's faculty for design.

The drawings from measurement are below the average. We have seen a much larger number of examples of measured work, and those exhibited are not very high in merit, either as subjects or as drawings. One gold medal in this class is awarded to a Birmingham student, William Haywood, for measured drawings of St. Patrick's Church, Patrington, Yorkshire, and the elaborately carved pulpit of St. Chad's in Birmingham, and other drawings. The prize is deservedly won, though the subjects could have been better chosen. The drawings are in pencil. Other drawings we notice include details of Kirby Hall, for which a silver medal is given to Albert Herbert, of Leicester; measured drawings of the screen, Southwell (bronze medal), by Harry H. Goodall; drawings of oak stalls in St. Mary's, Lancaster, by Charles B. Pearson, of that place; drawings of Church of St. Mary, Stafford, by Wm. Plant, Stafford (bronze medal); measured drawings of an iron screen and gate, by W. Tomlinson, Derby (awarded a silver medal); measured drawings of a railing, by W. H. Meggs, of the same town (silver medal); measured drawings of wrought-iron gates, by Arthur E. Martin, Rugby; drawings of Broke tomb, Cobham Church, by Reginald J. Beal, Maidstone; and others for which bronze medals and book prizes are given.

Amongst modelled designs in plaster, the gold medal is given to Josiah Connor, Salford, for a modelling for an embossed wall filling, a low relief and chaste design. Another is given to Ernest G. Gillick, Nottingham, for a fireplace and side of room; the figure of a girl singing forming the pilaster or jamb of fireplace in a niched recess is well modelled, and the whole is quiet and broadly treated. A silver medal is awarded to Chas. A. Sheehan, Bristol, for a pulpit decoration. We notice also a nicely modelled design for wall decoration by David H.

Hodge, of Plymouth; a design for a panel by Herbert D. Richter, Bath.

Many other departments deserve notice, but we can only mention a few of them under the class of design. James H. Rudd, Barnstaple, sends a design for metal work; a bronze medal is given to J. W. Harmstone, of the Royal College of Art, for a design for a gable containing a sundial, cleverly treated. The same prize is awarded to Philip Connard, of the same college, for an electric-light pendant. The design for wall-papers and stencilled designs comprise many of excellence and invention, and some of these are unrewarded. A gold medal is awarded to Helena R. Dow, of Glasgow, for a very appropriated design for wall-papered frieze, and to Robert Paterson, of Glasgow, for a carpet design, and to Geoffrey Alan Baker, Canterbury, for a stencilled frieze and filling—a clever and workmanlike design on blue ground, with blue and green female figures playing and reclining in the frieze. The silver medal designs by Elizabeth Davies and Christina S. Graham, Newcastle, for stencilled patterns, are bold and original in motive. A bronze medal is given to G. W. Hughes, of Birmingham, for a design showing much invention. Herbert D. Richter, of Bath, wins a silver medal for a wall-paper of much merit and quiet treatment. Robt. H. Arrol, of Glasgow, receives a bronze medal for a nice design. For stencilled designs, the works of Jennie Wood, Manchester; A. J. Madeley, of Maidstone; and C. H. Rogers have all been commended by the examiners, and receive bronze medals. We have no space here to refer to the designs for book illustrations, which are very clever. An able silver medal design is that by S. Rollinson, of Scarborough, in which the fairy-tale figures are cleverly drawn, and the arrangement is good. Margaret Thompson, of New Cross, also sends a clever design, which takes the same prize. We notice also a clever design for a lady's work-table in wood, with carved flat ornament, exceedingly quiet, by Isabel McBean, of New Cross, and some well-conceived figure designs in stained glass by Evelyn Holden, Birmingham, and a few modelled designs for metal-work by J. H. Cronshaw for bolt-plate, drawer handle, and kettle stand are very creditable in design.

A CABINET BELONGING TO THE LATE G. T. ROBINSON.

THIS cabinet was one of the few pieces of furniture belonging to the late G. T. Robinson, F.S.A., which were recently put up for

auction. It is made of stout oak, and is slightly carved and inlaid. There are two folding doors, with white metal hinges and pierced escutcheons, the two drawers above being likewise fitted with

similar escutcheons and also drop-handles. In the upper portion are shelves with open baluster fronts. The total height is 7ft., and the width about 4ft.

THE HOUSING OF THE WALLACE COLLECTION.

THE committee appointed by the Treasury to consider the housing of the Wallace collection of works of art have just issued their report. The committee consisted of Lord Lansdowne (chairman), Sir W. Harcourt, Sir E. J. Poynter, Mr. A. B. Freeman-Mitford, Sir F. Mowatt, Mr. W. Armstrong, Mr. Alfred de Rothschild, and Mr. Alfred Waterhouse, R.A. The report, which is in favour of the acquisition of Hertford House for the purpose, is signed by all the members except Sir E. Poynter, who makes the alternative proposal to house the collection on the site in Pall Mall now occupied by Messrs. Hampton's furniture premises, immediately west of the National Gallery. The Hertford House collection was bequeathed to the nation by the late Lady Wallace, on the following conditions:—

(a) That her Majesty's Government shall agree to give a site, and build thereon a special museum; (b) that this site shall be in a central part of London; (c) that the museum shall be a "special museum," and that the collection "shall always be kept together, unmixed with other objects of art."

Four proposals for disposing of the collection were considered by the committee, namely:—

(i.) To retain it at Hertford House; (ii.) to remove it to a building adjoining, or in the neighbourhood of, the National Gallery; (iii.) to remove it to a new building to be erected upon an independent and suitable site; or (iv.) to remove it to South Kensington.

The committee were of opinion that proposal iv. would not be in accordance with the conditions of the bequest, and this was therefore dismissed from consideration. Proposals i. and ii. would comply with the provisions of the bequest in regard to centrality, and that although the retention of the collection at Hertford House might not involve the actual construction of a special museum, it would nevertheless sufficiently comply with the terms of the bequest, and be strictly in accordance with the intention of the testatrix.

As to the three alternatives thus left them, all the members except Sir E. Poynter decide in favour of Hertford House. In some cases the lighting needs improvement, and the whole collection suffers from overcrowding. The space between one picture and another is insufficient for their proper display. The large quantity of furniture now in the house would also interfere with the convenience of visitors; but under the bequest, "personal and modern jewelry, trinkets, and effects," as well as "ordinary modern furniture and chattels," do not pass to the nation.

On the advice of Mr. (now Sir John) Taylor, surveyor to H.M. Office of Works, the committee suggest that the space on the ground floor to the north and west of the courtyard at Hertford House, now occupied by stables, coach-houses, &c., could be appropriated for new exhibition galleries. These would not have any top-light, but could be well lit from both sides by windows opening into George-street, into Manchester-street, and into the central courtyard. This alteration would increase the floor-space available for exhibition purposes by about 7,000sq. ft., thus increasing the total available floor-space from some 18,000sq. ft. to some 25,000sq. ft. The length of the picture galleries on the first floor could further be increased by extending the skylights, thus converting the first floors of the eastern and western wings of the main building into exhibition galleries, lit from above. The adoption of these suggestions, or some of them, together with minor alterations, would, the committee believe, enable the collection to be worthily exhibited, and would afford ample room for ordinary visitors. As to the cost at which it would be possible to acquire Hertford House and adapt it for the purposes of a public exhibition, there is reason, it is stated, to hope that the leasehold and freehold interest may be obtained for between £60,000 and £70,000, and the cost of the alterations is estimated at about £24,000—a total cost of some £90,000. The estimate, however, is only approximate, and does not include electric or other lighting. In conclusion, the committee summarise their reasons for recommending the retention of the collection at Hertford House under the following half-dozen heads:

(i.) Such an arrangement would be in accordance with the terms of the bequest, and would, in the view of the executors, give effect to the wishes of the testatrix.

(ii.) It would, more than any other arrangement, preserve the distinctive character of the collection, and would retain it within the building in which its owners had placed it, and which they had adapted for its reception.

(iii.) It would be much the less costly of the alternatives suggested.

(iv.) It would avoid the risks inseparable from the removal and rearrangement of the collection.

(v.) It would provide a museum which, owing to its complete detachment from other buildings, would be specially free from risk of fire.

(vi.) It would avoid delay and afford the public an opportunity of entering into the enjoyment of this priceless assemblage of works of art within a few months of the present time instead of five or six years hence.

The witnesses were examined by the committee in private, and included Mr. (now Sir) John Taylor, who gave various estimates and particulars as to cost and space; Mr. Alfred Waterhouse, one of the members of the committee, who said he viewed the decoration of the rooms of Hertford House as a most valuable portion of the bequest; Mr. Murray Scott, Mr. Charles Davis, Mr. J. P. Heseltine, one of the trustees of the National Gallery; and Sir E. Poynter. A number of plans of Hertford House are appended to the report, as well as a plan of the National Gallery.

The following have been recommended by the Treasury as trustees of the collection:—The Earl of Rosebery, Sir Edward B. Malet, Sir John Stirling Maxwell, M.P., Major-General Sir Arthur Ellis, Mr. A. B. Freeman Mitford, Mr. Alfred C. de Rothschild, and Mr. John Murray Scott, who is required by the terms of the will to be a trustee. Mr. Claude Phillips has been appointed keeper of the collection.

The Government have lost no time in acting on the report, for a supplementary estimate has already been issued for the purchase of Hertford House, the sum asked for being £80,000.

THE VERDIN TECHNICAL SCHOOLS NORTHWICH.

THE schools were opened on Saturday week by the Duchess of Westminster, being a gift to his native town by Sir Joseph Verdin, Bart., D.L. The schools are built on a corner site, the two principal façades being well broken up and enriched with terracotta ornament and stringing. The main entrance is splayed on the angle of the building at the junction of the London-road and the Crescent, forming a very pleasing break to the front. Over the main entrance, inclosed in a bold panel, are the words, "The Verdin Technical Schools and Gymnasium," the pediment on which this is placed being supported on angle piers, corbelled out, and finished with enriched capitals.

Over the entrance to the art school, fronting London-road, are erected representations of Science and Art, splendidly modelled, and enriched with festoons of flowers and fruit.

A large ornamental panel is also placed in the principal façade fronting London-road, representing Painting, Sculpture, Music, and Science. The figures are admirably composed and modelled, and form a feature of great interest to the building.

A large polished granite panel is placed in the front, near the principal entrance door, surrounded by a terracotta frame with two specially-modelled figures supporting each side; carved on the granite panel in bold style is an inscription.

The building, as before stated, has two entrances, with vestibule and spacious entrance hall communicating with corridors, which form a square with an area in the centre, thus admitting light and ventilation all round; two means of exit are also formed at the back.

Mullioned and transomed windows in terracotta are provided to the two main fronts, and gables are surmounted with terracotta copings, terminals, and ornamental scrolls of special design. All the external facework is built with red Ruabon stock bricks, all of which, including terracotta, has been supplied by Mr. J. C. Edwards, of Ruabon.

Plans of the two principal floors are given on our illustration, which will show the general accommodation provided, which includes four classrooms, 21ft. by 25ft. 9in., divided with Strapps' latest patent sliding partitions, supplied and fixed by Messrs. John Heywood and Sons, of Manchester; also all the internal fittings, including laboratory fittings, &c. There is also a gymnasium, cookery and laundry classrooms, carpenters' and plumbers' workshops, committee and cloakrooms on the ground floor.

On the first floor is placed the chemical and

physical laboratories, with preparation room, and also lecture room. The art rooms are placed on the north side of the building, well-lighted, with large windows cut up into the roof, and glazed with plate-glass, including elementary art, 23ft. by 25ft.; art room, 41ft. by 32ft.; art masters' room, 20ft. by 14ft.; storeroom, 14ft. by 12ft., and modelling room, 18ft. by 12ft.

The heating is by low-pressure hot-water pipes and ventilating radiators. In addition to the ventilating radiators a system of automatic ventilators has been carried out by Messrs. E. H. Shorland Bros., of Manchester.

Several stained-glass windows are in the main and art entrances. The whole of the building has been executed from designs, prepared by Mr. Joseph Cawley, M.S.A., architect, of Northwich, by Mr. William Molyneux, builder, of the same town, Mr. John Broadhurst acting as clerk of the works, the total cost, including site, being £12,000.

A CHARLES II. CHAIR.

CHAIRS, like the Charles II. arm-chair, with scrolls and volutes freely used, and with cane seats and backs, were in use during the latter part

of the 17th and well on into the 18th century. The volute-like front legs in the subject of our sketch turn inwards at the feet; in many cases they turn outwards. The total height is 4ft. The width of seat, out to out, in front is 1ft. 10½ in., and at the back 1ft. 6in.

THE ARCHITECTURAL ASSOCIATION EXCURSION, 1897.—I.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

THE late Edmund Sharpe, of Lancaster, the founder of the annual excursions of the Architectural Association will only be recollected by those excursionists who joined during the early years, when these useful and enjoyable outings were originated, and yet Lancaster, where he lived and practised, has for the first time only now been chosen as the headquarters for the party. As a Gothic revivalist, Sharpe's leading aim was to inspire young architects with the same enthusiastic love for Ecclesiastical detail of 13th-century date as that with which he himself was actuated, and, moreover, it was a *sine quâ non* with him to measure and plot, on the spot, mouldings and carvings of various periods so as to classify and tabulate them on scientific principles, always, be it noted, with the leading idea of furthering the purist's view of the revival of Mediaeval Architecture generally and of the Lancet period in particular by preference, and at all hazards certainly aiming at its restriction to

nothing later than the style contemporary with Richard II. Perpendicular English Gothic five-and-twenty years ago had few active admirers and no advocates. The turn of fashion in favour of the "Late and Flat," more recently set in motion by the late John Dando Sedding in favour of Tudor work, had in Sharpe's days hardly commenced, and so he was enabled by his personal charm and strong individuality of character to direct the studies unchallenged and marshal the industry of those who were attracted by his enthusiasm to follow his lead in these sketching trips. Early and late were the members at work, catching trains at all sorts of impossible hours, and ever making indefatigable efforts with the best of good will to keep pace with the serious enterprise of Edmund Sharpe, their cicerone—a task which at times led the less energetic, at any rate, to the opinion that these outings had lost their holiday guise more completely than had been contemplated. This ideal after Sharpe's lamented death became a memory only, and although the late George Edmund Street once called the A.A. excursions, as thus conducted, "architectural scrambles," those who took part in them never lost sight of the industry which their founder's methods of work inculcated, and for many years on each occasion after the final dinner it remained the custom for the week's work to be circulated for emulation and criticism. In this way, undoubtedly, much good work was done. Taste gradually saw a change, church-work no longer exclusively engaged the attention of the excursionists, while visits to old mansions and manor-houses in search of domestic architecture not infrequently became associated with hospitality on the part of the owners which scarcely accorded with the rigid régime of Edmund Sharpe, and certainly at times hardly conducive to sketching and measuring up. The congenial and ever-to-be-regretted John Loftus Robinson, the hon. photographer to the excursion for 14 years dating from 1880, introduced his irrepressible camera, and some of the members with pardonable resignation after his advent, relied unblushingly on this instrument, at least to some extent, for their records of the buildings visited. It is not thus difficult to realise how the holiday side of these excursions, as time went on, began to assert itself, particularly as men's minds had turned to seek inspiration from the buildings which originated in the opulence of the Renaissance, while even the productions of the less refined convivialities associated with Queen Anne's times may possibly have exerted some influence in the direction indicated, which scarcely the Puritanical tendencies of a Dutch William could moderate or recall. "Free Classic," anyway, seemingly justified greater freedom in more ways than one. The absence of any concerted plan, too, left everyone unrestrained in the method of his working, the quartermaster's whistle alone remaining to assert the necessities of the programme. The leadership, on these occasions, of the successive presidents of the Association has approached, of course, nothing like the standard inaugurated by the founder of these outings, and so the excursions have drifted along their unrestrained and happy course, without perhaps any distinguishing records, though by no means devoid of practical utility, and, thanks to the endeavours of the hon. secretaries, always accompanied by good fellowship and mutual advantage. The admission, too, thus obtained to a very large number of private houses, many of them being in out-of-the-way situations not usually accessible, has enabled excursionists to see a vast variety of historic domestic work and antique furniture. It may be interesting, perhaps, in this connection, to give a complete list of the headquarters of these twenty-seven excursions, dating in the following sequence from 1870, when they began, the first six being arranged by Mr. Edmund Sharpe himself:—1870 Lincoln, 1871 Ely, 1872 Newark, 1874 Paris, 1875 Angoulême, 1876 Winchester, 1877 Warwick, 1878 Hull, 1879 Wells, 1880 Norwich, 1881 Worcester, 1882 Kettering, 1883 Yeovil, 1884 Bury St. Edmund's, 1885 Banbury, 1886 Town Malling, near Maidstone; 1887 Bath; 1888 Matlock Bath, Derbyshire; 1889 King's Lynn, 1890 Oxford, 1891 Shrewsbury, 1892 Taunton, 1893 Diss, 1894 Wells, 1895 Cheltenham, and 1896 Tunbridge Wells. It will thus be seen that Yorkshire has only been visited once, and Hull has hitherto remained the highest northern point till now, when Lancaster will carry the excursionists somewhat further afield, though it will be obvious that the several centres have been very well

THE VERDIN TECHNICAL SCHOOL & GYMNASIUM — NORTHWICH, CHESHIRE

ARCHITECT, NORTHWICH

FIG. 154.

FIG. 155.

diversified, and often admirably chosen for the purpose in view. Of late years the selection has been made chiefly to include houses, as we have already mentioned, and this year this stipulation has led to the choice of a Lancashire and Westmoreland district, so as to comprise Claughton Hall, Cark Hall, Borwick Hall, Hoghton Towers, Samlesbury Hall, Livesey Hall, Levens Hall, Holker Hall, and Thurland Castle, nine well-known examples in the neighbourhood of Lancaster. We have on various occasions illustrated some of these, besides other Lancashire and Cheshire old mansions. To-day we accompany these notes with some other illustrations, so as to give our readers a more graphic idea of the places in the programme. Before passing on to these, it may be well to add that, although many of the older men have gradually dropped out of the ranks of late years, some still retain seats on the committee, and the position so usefully held for many years by Mr. H. D. Searles-Wood has now been taken up by Mr. W. Talbot Brown, the hon. sec., who is one of the original excursionists, and was personally connected with Mr. Edward Sharpe. We have no wish to anticipate the proceedings which commence on Monday, and the following descriptive particulars but briefly serve as giving a few facts concerning the places set down in the list, of which we give a copy, as follows:—

Monday, Aug. 9th, Claughton Hall, stay 1½ hours; Hornby Church, 1 hour; Thurland Castle, 45 minutes; Tunstall Church, 30 minutes; Kirkby Lonsdale, Bridge and Church, 45 minutes.

Tuesday, Aug. 10th, Cark Hall, 1 hour; Cartmell Priory and village, 3 hours; Holker Hall, 1 hour; Grange, 1 hour.

Wednesday, Aug. 11th, Borwick Hall, 2 hours; Beetham Church (luncheon), 30 minutes; Levens Hall, 2 hours.

Thursday, Aug. 12th, Samlesbury Hall, 1 hour; Livesey Hall, 1 hour; Hoghton Towers, 1½ hours.

Friday, Aug. 13th, Furness Abbey, all day; and on Saturday, Aug. 14th, Lancaster Castle, Gateway, and Church.

Lancaster itself has a history of the first consequence, and from its famous castle an excellent view of the greatest beauty is obtained overlooking Morecambe Bay, a fine expanse set off by the Westmoreland hills and the mountains of the Furness district, while the shallow Lune enriches, as it winds its way through, the fertile meadows to the left of the picture. John o' Gaunt, "time-honoured Lancaster," made the Palatine city his residence, and built the grand gateway and also the tower of the castle which bears his name. Over the archway of the gatehouse stands the modern effigy of the Duke, carved by one Nimmo, a Scotch sculptor between 80 and 90 years ago. The elevation and plans measured herewith were drawn by Mr. T. Baines and are reproduced by permission with our other line lithographic plates from the "John o' Gaunt's Sketch Book," a private and admirable publication issued for private circulation only among old pupils and friends associated with Messrs. Paley and Austin's office, Lancaster. There is no need here to recount the tale of Lancaster's story, which dates its records from the first century, when it possessed a camp on the lofty site of its existing castle. Roger de Poitou greatly enlarged the stronghold, 1094, and under the Conqueror the place was enfeoffed by nearly 400 English manors, and the whole of the county of Lancashire.

There are now five towers—the Gateway Tower, the Keep, the Dungeon Tower, Adrian's Tower, and the Well Tower; the three last, the guide-book says, are on Roman foundations, which is very likely. Among the most interesting details to be noted by the architect in this district are the doorheads in stone, shaped and curiously moulded. We give five examples, drawn by Mr. W. J. Ralph—two in Lancaster itself, one near Bentham, another near Quernmore, and one from a house near Settle. They date from 1671 to 1693; but these are only a selection from the many other varieties of similar date, equally suggestive, to be seen at Wennington, Brookhouse, Torrisholme, Halton Park, Newby, Mellinghouse, and Giggleswick, as well as in Penny-street and Church-street, Lancaster. The church of St. Mary's-on-the-Hill at Lancaster was restored by the late Mr. Paley. It is chiefly of 15th-century date, and contains some good stalls and screen work, brought either from Cockersand Abbey or from Furness. The tower is only about 140 years old. Claughton Hall, one of the first places put down to be seen, is possessed of a gatehouse, with a Tudor oriel and a terrace, with two Stuart towers, which make an interesting feature. The modern church hard by has the proud possession of the oldest dated bell in the country. Its Longobardic inscription gives the year 1296. Of Hornby Church we give a drawing, by Mr. S. Wright, the zealous hon. sec. of the "John o' Gaunt's Sketch Book." It shows the tower, which is octagonal, as well as a sketch of Thornton Tower, also near Lancaster. Of Hornby Castle, towering, as it does, on the top of the hill in a fine park, much could be said, although it was "defaced, dismantled, and rendered defenceless" during the Civil Wars by order of Parliament, and so has been much modernised in the construction of the present mansion. Melling and Tunstall Churches, both of Perpendicular date, are to be seen. In the former, the unusually large remains of old stained glass are spoken of as worth noting, while in the latter the mutilated effigy of the builder of Thurland Castle is pointed out. This house is one of the few moated granges in Lancashire; but it was practically renovated by Sir Jeffry Wyatt, who destroyed everything he touched. Messrs. Paley and Austin restored the house after a fire some years since, adding thereby to its interest. At Kirkby Lonsdale, the old bridge over the Lune forms the interesting subject of Mr. W. Talbot Brown's spirited drawing accompanying these notes. Sections and plan are given with the view. From Levens Hall, Westmoreland, famous for its formal gardens, which are really rather toylike, we give three interior views, showing some of the chimney-pieces, and on the same sheet is a charming group of old chairs and a monument in Cartmel Priory lady-chapel from photographs by Mr. F. Turner, of Morecambe. A view of the exterior of this famous church appeared in the BUILDING NEWS for June 25 this year. We shall give several other illustrations next week, including one of the gardens at Levens. Two exteriors of the hall itself were published in our issue for Dec. 25, 1891, drawn by the late J. D. Sedding.

On Saturday afternoon the corner-stones of a new Liberal club at the village of Norden, near Rochdale, were laid. The building, including the fittings, is expected to cost about £2,000.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXVI.

A FEW examples of the building up of braced girders may now be selected.

Fig. 154 illustrates a favourable form of light shallow girder. Though only 2ft. deep, it is built with lattice bracing, an advantage from the point

FIG. 156.

of view of appearance and of weight; this example is of the type used to support the promenade of the concert pavilion on Southsea pier. The top and bottom flanges are composed each of a pair of 3½ in. by 3½ in. by ½ in. angles, *a*, riveted together with plates *b*, 7½ in. by ½ in., leaving an

FIG. 157.

open space for the gussets *c*, to which the bracings *d*, of T-section, 3½ in. by 3½ in. by ½ in., are riveted; the vertical struts are also of T-section.

Fig. 155 illustrates a light girder 38ft. long, having straight top and segmental bottom flanges; it is 4ft. deep at the ends and 3ft. in the centre. The flanges are each formed of two angles, 3½ in.

FIG. 158.

by 3½ in. by ½ in., connected with flange-plates; the ties comprise two bars, 4 in. by ½ in., and the struts, two angles, 3 in. by 3 in. by ½ in., all being riveted through gusset-plates. Fig. 156 shows the joints enlarged. This is an example of a small class of girder which would have been solid plated only a few years since, but which is now

Fig. 159.

built up in a light and strong fashion. The roofs of our railway-stations and markets afford many examples of similar structures, girders so shallow as 10in. or 12in. deep being often lattice-braced rather than solid-plated. Fig. 157 is an

In some cases bracings are bent slightly, in order to avoid the employment of distance-pieces, or to permit of the passing of bars which are in the same plane at the flanges. Fig. 158 shows an example of the latter kind, the flat bar and

Fig. 160.

example of this kind. It is a small purlin 3ft. 10in. long by 12in. deep in the centre, built of a single 2½in. by 2½in. by ¾in. angle for each flange, and bracings of 2½in. by ¾in. flat bars only.

In purlins of larger size, double angles, with

angle each passing between the double angles of the flange; not much bending of this kind is permissible, because it gives an initial set to the bars, and it would not, therefore, be permitted in any heavily-strained girders. Fig. 158 illustrates also the cutting off of the flanges of the

Fig. 161.

or without gusset-plates, would be used; besides increasing strength, the double angles permit of the insertion of the bars between, so rendering the structure symmetrical. If the bracing-bars are put outside of flanges of tee-section, or outside

angle strut to permit of the passing of its web between the flange angles. This is permissible, because the thrust on the angle is estimated to be taken by the rivets at the ends, and the strength afforded by flanges is of less importance at the

Fig. 163.

of angle-section flanges, then they must either be unsymmetrical if ranged on one side, or, if on both sides, packings must be inserted if they are crossed and riveted at the point of crossing, as they are in all but very small shallow girders.

ends than at the centre, where the bending moment is greatest.

Fig. 159 shows an example of a girder of moderate dimensions built with bars and angles, in which distance-pieces are freely used. The

top and bottom flanges are formed each of two angles and a plate, the ties are each a single flat bar riveted between the angles, and the struts are each an angle, riveted outside; the flange angles are riveted together, a distance-piece encircling each rivet. The end-posts are formed of angles connected with rivets also passing through distance-pieces, and the riveting at the centre of the struts and ties is done through distance-pieces.

Fig. 160 shows how a wide light girder may be built up very cheaply. Top and bottom flanges are each made of a plate and a pair of angles separated widely apart; the tie-bars are flats riveted on the outsides of the angles, and the struts are angles riveted on the inside. The angle struts are connected and stiffened with cross braces, and might be braced still further, if desirable, by diagonal bracings, especially if the girders were deeper; if the ties were narrow, gussets would be used. At the ends where the ties are subjected to the greatest stresses, gussets

Fig. 162.

may also have to be used, even though not required about the centre.

The arched principals of large modern roofs are mostly lattice-braced, the bracing being generally either simple triangulations or simple crosses. The iron roof principals of the Machinery Hall of the 1878 Paris Exhibition were trussed girders built of angle, plate, and channel, three bays of which are shown in Fig. 161. Fig. 162 shows a vertical section at the deepest part of the principals. The top flange was straight, the bottom one curved; the straight flange was 63ft. long, composed of a plate and two vertical webs united with angles, the webs being 9·8in. apart, 7½in. deep, and ¾in. thick; the angles measured 2½in. by 2½in. The lower curved flange was of a similar section, but stiffened towards the base with additional plate thicknesses. The vertical members of the truss were of angle-irons, *a*, grouped in pairs (compare Figs. 161 and 162), riveted on opposite sides of the top and bottom webs of the flanges. The diagonal ties were of single channel-irons, riveted outside the webs, those near the base being stiffened each with a plate riveted to their backs.

Fig. 163 shows a method of construction adopted in the bracing rafters and purlins of the Liverpool Central Station; the rafters, though 3ft. 2in. deep, have their top and bottom flanges of T-iron, connected with a single triangulation of channel-bars; the purlins are also 3ft. 2in. in depth, and the flanges are composed of a pair of angles placed back to back and connected with channel-bars. Distance-pieces are inserted at the points of crossing equal in thickness to the vertical web of the angles. J. H.

The Stanley Road Garden at Bootle was opened on Saturday. It is situated on the east side of that thoroughfare near Merton-road. It covers an area of 2,467 square yards, having a frontage to Stanley-road of 60 yards, and a depth of about 45 yards. When the corporation took possession, this land was about as rough and as unpromising a piece as could be found; but it has been levelled and drained under the direction of the borough surveyor, Mr. J. H. Crowther, and beautified under the superintendence of Mr. John Drysdale, the parks superintendent, at a cost of about £800.

ART STUDENTS' EXHIBITION AT SOUTH KENSINGTON.

THE exhibition of the works of students who have contributed to this year's National Competition of Schools of Art was opened on Monday to private view in the large iron building adjoining the southern galleries of the South Kensington Museum. The works sent in were 50,255 from 281 schools of art and branch schools, 35,560 from 298 science schools, and 11,796 from 449 art classes. The works selected for the National Competition were 5,853, of which about a fifth are hung. The thirty examiners included Mr. Walter Crane, Sir John Linton, and Mr. T. Armstrong, Director for Art. The prizes at their command were 16 gold medals, 94 silver, 255 bronze, 510 books, and in addition honorary rewards to Free Students at the Royal College of Art of three gold, 24 silver, 80 bronze medals, and 95 books in respect of 713 works contributed by them. The gold medals were won by Mr. Wm. Haywood of Birmingham for measured drawings of Patrington Church; Mr. Offlow Scattergood and Mr. J. A. Swan, both also of Birmingham, respectively for a tapestry design, and for a design for a provincial market. Mr. W. Bryan Binns, of Bristol, for model of a figure from the nude; Mr. B. G. Alan, of Canterbury, design for a stencilled frieze; Mr. W. N. M. Orpen, of Dublin, for chalk drawings, set of three, of figures from the nude; and Miss Helena R. Dow, also of Dublin, for a design for a wall-paper; Mr. George A. Paterson, for a design for a memorial chapel, and Mr. Robert Paterson, for a carpet design, both of Glasgow; Miss Alice Mary Appleton, of Hammersmith, for designs based on a flowering plant to fill given spaces; Mr. G. M. Ellwood, of Holloway, for a design for a piano-front; Mr. A. H. Baxter, of Leicester, for a design for the interior decoration of a library; Mr. Ernest G. Gillick, of Nottingham, for modelled design for a fireplace; Mr. Josiah Connor, of Salford, for modelled design for embossed wall-filling; Mr. R. W. Levick, of South Kensington, for a modelled small figure group of two wrestlers, remarkably finely conceived and executed—the Princess of Wales' Scholarship of £25 was also awarded to this student; and Mr. Alfred Champ, for model of a figure from the antique. The three gold medals to the students of the training class of the Royal College of Art were awarded to Mr. Robert Andrews, for a chalk drawing of the Laocöon; to Mr. Charles A. Eva, for studies of historic styles of ornament; and to Mr. Harry Watson for sketches from the nude. The reports of the examiners speak highly of Mr. Champ's study of the Bronze Hercules as admirable in the rendering of the action and character of the original. The modelled figures by Mr. Andrews and by Mr. Orpen are also praised. The section of laces, embroidery, and carpets again this year receive the approval of the examiners, who note a distinct improvement in the taste and selection of pattern forms. They say that there would seem to be quite a new impulse in the treatment of simple floral and linear forms. They add that quite remarkable taste and invention are sometimes shown in these designs and their suitability to the material is to be seen in the executed work.

A NEW ANTI-SIPHONAGE CLOSET-TRAP.

THERE have been various methods adopted for the contrivance of anti-siphonage traps for closets and other sanitary appliances which, with a varying degree of success, may be said to have accomplished the end in view. Mr. P. T. Ardley, of 6A, Stopford-road, Walworth, has patented a siphon made of brass or other metal to attach to the crown of the trap, and having at its turned-over end an indiarubber ball attached to a guiding-pin working in a slot, and so seated that the vacuum caused by the flushing of the trap to which this arrangement is attached lifts the ball, obtaining thereby at once a fresh intake of air by suction, and thus stopping all likelihood of siphonage. As the ball by its own weight resumes its place over the inlet-hole, an escape of soil gas is prevented. The simplicity of the patent is its chief recommendation, and the novelty mainly consists in the automatic action of the siphon, which, when properly fixed and kept free from corrosion, can hardly go wrong. The rubber ball is readily renewed. In the sketch, A is the rubber ball spindle or other

valve, B the brass or other seating for the same, C is the bar or guide to prevent ball from passing over the top of siphon, and D the siphon, of brass or other material. It will readily be seen that the adoption of this trap will save much material and labour at present consumed in

carrying the long pipes to the tops of the houses. Its cost is very small, and it can, of course, be made of any material.

The memorial-stone of the new board school now being erected in the Essex-road, Little Ilford, E., was laid on Thursday, July 29 last. The schools are designed to accommodate 1,532 children—i.e., ground floor (infants), 532; first floor (girls), 500; second floor (boys), 500. The builders are Messrs. Wm. Gragar and Son, Stratford, E., the contract sum being £14,163 7s. 4d. The architect is Mr. S. Jackson, 65, Fenchurch-street, E.C., and Manor Park, Essex.

The directors of the Midland Railway Company have sanctioned the proposed arrangement for building a new bridge over the railway and river at Burton End, Melton Mowbray, and have authorised the work to be included in the company's Bill for next session. The estimated cost of the bridge is £12,000, the Leicestershire County Council and the Melton Mowbray Urban District Council each contributing £1,000, and the railway company finding the remaining £10,000.

The Honourable Mrs. Meynell Ingram, of Hoar Cross, has lately presented, for use in Lichfield Cathedral, a processional cross, and the Chapter have accepted it. It was purchased in the island of Corfu; it is of Italian workmanship, of the 13th or 14th century, made under Byzantine influence, the material copper, first silvered and then richly gilt. The cross is embossed with figures on both sides. On the obverse it has in the centre the crucifix, with figures of St. Mary and St. John in the quatrefoil ends, right and left, and a censuring angel above and below; on the reverse is a figure of Christian glory, with the emblems of the Four Evangelists at the four ends. The whole is chased and much enriched with raised borders or edges.

Miss Harrison performed, on Saturday morning, the ceremony of opening a new post-office which has just been built at Lydney at a cost of £2,000. The building was erected by Messrs. Kear and Son, from plans by Mr. Howard Howells, of Lydney.

The memorial-stones of a Wesleyan school-chapel were laid on Saturday afternoon on a vacant piece of ground in Ladypit-lane, Beeston Hill, Leeds. The building will be of brick, with stone dressings, and will be seated for 250 persons; adjoining it will be three classrooms. Mr. G. F. Danby, of Leeds, is the architect. The contracts for brick and stone work have been let to Mr. W. Schofield, and that for joinery and carpentry to Messrs. J. Tomlinson and Son. The cost will be about £1,250.

Rapid progress is being made with the work of erecting the memorial to the late Prince Henry of Battenberg, governor of the Isle of Wight, at Carisbrooke Castle, by the conversion of the old gateway into a museum for the reception of interesting objects connected with the island and with the history of the castle itself. The programme of alterations includes the remodelling of the gatehouse and the conversion of the guardroom and portcullis chamber into a museum.

Good progress is being made by the Great Western Railway Company with the doubling of their line through Cornwall. On Sunday another section—that between Grampound-road and Probus—was opened for traffic, and the section between Burn-gelow and Grampound-road is nearly ready for inspection.

OBITUARY.

MR. GEORGE ELKINGTON, the senior member of the firm of George Elkington and Son, died a few days ago at Worthing. Mr. Elkington was in business as an architect and surveyor from 1847 to 1895, for the last 20 years of that time in partnership with his son. From 1854 to 1895 he was a Fellow of the Royal Institute of British Architects, but for the past two years has been on the list of Fellows retired from practice, and he also held for many years the appointment of surveyor to the vestry of Bermondsey under the Metropolis Local Management Act. He was a past-master of the Coopers' Company.

CHIPS.

Romney's portrait of Sir John Stanley has been purchased for the Louvre.

The Court of Common Council decided last week to hold another loan exhibition of pictures at Guildhall next year, illustrative principally of the French school.

The President of the Local Government Board has decided to appoint a Departmental Committee to inquire concerning the disposal of the sewage of large towns and cities.

The Lancashire and Yorkshire Railway Company are making preparations for the extension and improvement of Rosegrove Station, which, when completed, will be one of the most important in North-east Lancashire. The contracts involve an expenditure of some £100,000.

The urban district council of Ilfracombe have resolved to borrow £2,956 for a market and various improvements.

The foundation-stone of the new board school at Kelley, near Wellington, Salop, was laid by the chairman of the Wellington School Board on Friday. The builders are Messrs. R. and J. Millington, Oakengates, and the architect is Mr. C. R. Dalgleish, of Wellington. When complete, the building will accommodate about 350 children, and cost the sum of £2,800.

Mr. R. M. Littler, C.B., Q.C., chairman of the Middlesex County Council, laid on Tuesday the foundation-stone of the new police-court which is to be erected at the corner of Archway and Bishop's roads, Highgate. The building, which is to cost £6,000, is being built of red brick, with stone dressings, from the designs of Mr. F. H. Pownall, the architect and surveyor to the Middlesex County Council. The site cost £5,000.

Mr. Robert H. Bicknell held an inquiry on Friday, at the Croydon Town Hall, on behalf of the Local Government Board, into the application of the Croydon Corporation for sanction to borrow the sum of £32,000 for the erection of new water-works adjoining a well lately sunk at Waddon. Mr. Balfour Browne, Q.C., appeared in support of the application, which was opposed by Mr. Reginald Bray on behalf of several ratepayers and millowners on the River Wandle.

New board schools have just been opened in Ings-road, Wakefield. They accommodate 600 children, and cost £14,500. Messrs. W. and D. Thornton, of Wakefield and Dewsbury, were the architects, and the contracts were carried out by local tradesmen.

A new synagogue in Highfield-street, Leicester, was opened last week. It measures 31ft. by 38ft. Under the gallery is a schoolroom, shut off by revolving iron shutters.

The City and Waterloo Railway is expected to be opened for traffic at the beginning of next year. The two terminal stations are being constructed, and the rails are being laid, while the electrical installation at Waterloo is in progress. The chief delay is anticipated in connecting the City terminus with the central subway in front of the Royal Exchange, as a maze of sewers, electric, gas, and water mains has to be encountered, diverted, and reconstructed before the junction can be effected.

At Upton, Torquay, new Church schools have been opened, adjoining St. James's Mission Hall. They accommodate 300 children, and cost about £2,800. Mr. Edward Richards, of Torquay, was the architect, and Mr. S. G. Trethewey was the builder.

A new Calvinistic Methodist Chapel at Berthen, Lixwm, Flintshire, was opened last week. The new chapel, which replaces an old and dilapidated one, has a front elevation of local stone, with circular windows dressed with sills of Halkin stone. The interior fittings are of pitch-pine, and there is seating for 150 persons. Mr. Edward Davies, Ffynnoncyff, has also provided a new schoolroom. The chapel was erected by Mr. Richard Jones, contractor, Holywell, from plans prepared by Mr. James Hughes, Denbigh. The total cost has been about £500.

Building Intelligence.

ABERDEEN.—Alterations and improvements of considerable magnitude are at present being effected in the internal arrangements of the head office of the North of Scotland Bank, from plans by Mr. A. Marshall Mackenzie, A.R.S.A., of Aberdeen. No alterations will be made to the exterior, now more than fifty years old, which is locally regarded as one of the finest examples of architecture and of granite construction in the city. The windows to Union-street and King-street will, however, be modernised by the removal of the present small panes of glass, and the substitution of one large sheet of plate-glass in each window. In order to enlarge the telling-room a 2ft.-thick stone wall running right through the building, 50ft. long and 18ft. high, has been entirely removed by the contractors, Messrs. James Abernethy and Co., Councillor Duguid, and Messrs. M'Robbie and Milne. Steel beams and pillars now bear the weight of the upper structure. By the removal of the stone wall and the getting rid of passages on either side about 11ft. has been added to the width of the telling-office, while the officials' rooms have been rearranged. The outer vestibule leading to the telling-office is to be lined up to the height of 9ft. with polished granite of three kinds—Rubiaw, Corrennie, and Kennay—while the lintels and jambs of the two doorways are to be of the same materials. The floor of the vestibule will be laid with marble mosaic, having the name of the bank in the centre. The floor of the telling-office will also be of marble mosaic. In the centre, between the entrance door and the counter, the bank's shield and motto on a large scale are introduced, the surroundings being Scotch thistles, panels, and scrolls. The walls of the telling-office, up to the height of 5ft. or 6ft., are to be lined with polished marbles of four different kinds, while round the walls at intervals thirteen marble pilasters to match the dado, each 15in. wide, will run from floor to ceiling, the bases and capitals being carved. The two large central pillars will be of marble to match the others. The jambs and lintels of all the doorways inside the telling-office will be of Sienna marble. The granite work is in the hands of Messrs. Alexander Macdonald and Co., Limited, while Messrs. James Bannochie and Sons are supplying the marble and the mosaic floors and at the same time executing the plaster-work. For the frieze of the telling-office Mr. Mackenzie has secured exact copies from certain of the Elgin marbles in the British Museum, the depth being about 3ft. The ceiling will be gilded. The electric light is being put into all the offices, safes, vaults, &c., by Messrs. Shirras, Laing, and Co. Messrs. M'Robbie and Milne are making the counters, desks, &c., and execute the other woodwork, whilst Messrs. George Donald and Sons supply all the glass and carry out the painting and other decorations.

BURSELEM.—A plot of land, formerly the site of one of the principal residences in the Potteries, that once occupied by the late Mr. Edward Wood, Hope House, Burslem, has been secured by the Roman Catholic body, for the accommodation of their Burslem mission. The site fronts Hall-street, and on the rear portion of the land a building to comprise a school-chapel has been commenced, the front portion of the land being held in reserve for the erection of a permanent church and presbytery at some future time. The erection now undertaken will be of a plain character, in red brick, the schoolrooms being on the first story and the chapel above them, the windows of the latter having traceried lights to distinguish it from the schoolroom below. The school buildings are planned to give accommodation for 130 infants and 224 boys and girls in a mixed school. The church will accommodate 368 worshippers, and there are seats for a choir of 18 in the sanctuary. Priests' and choristers' sacristies are provided. The building contract has been let to Mr. W. Cooke, of Burslem, whose tender was £2,254, and the cost will be increased by the requisite fittings to £2,600. Messrs. R. Scrivener and Sons, of Shelton, are the architects.

CUMMOCK.—The free church at Cummock, Ayrshire, is about to be rebuilt as a memorial to the late Hew Crichton, who died last year at the age of 97 years. The new church will be on plan a truncated cross, the end of the longer arm pointing to the Ayr-road. The elevation has a central high-pointed gable finished with a cross,

with a buttressed tower surmounted by a spire on one side, and a smaller gable relieved by buttresses terminating in ornamental pinnacles on the other side. The main entrance door is in the centre of the front gable, and will be approached by a flight of steps. It will have on either side lancet-headed windows for lighting the corridor. The front gable is pierced by two two-light large windows filled with tracery, while above these is a circular window with moulded flowing tracery. The tower and spire rise to a height of 140ft., and the angle buttresses of tower terminate in moulded pinnacles with finials and carved crockets. The side elevations will be pierced by four-light and three-light windows filled with mullions and tracery work. The style adopted is the Decorated Gothic, and the flowing window tracery partakes somewhat of the Flamboyant treatment. Internally the church will have a front entrance corridor 8ft. 6in. wide, at one end of which is placed the session-room, with classroom above, while the tower at the other end contains the gallery stair, with side entrance door. The nave will be 44ft. wide, and the transepts 52ft., with a length from front corridor to back wall of apse of 68ft. The back wall will be broken up by an opening 27ft. wide, beyond which will be placed a raised platform containing the pulpit and elders' seat; and still farther back there is to be an apse, providing accommodation for organ and choir. The church will be seated for about 500. Behind the church there will be a hall which will hold 150, and the minister's vestry. The roof of the church will be lined with pitch-pine, and will be open to the collar beam, and the pews will also be of pitch-pine, with moulded ends. The church and hall &c., will be heated by hot-water pipes, and will be ventilated at the ridge. The architect for the buildings is Mr. D. Menzies, York-place, Edinburgh. The contractors are all local men, the Provost of the town (Mr. Richmond) being the builder.

GOLCAR, HUDDERSFIELD.—On Saturday afternoon, Sir James Kitson, Bart., M.P., Lord Mayor of Leeds, visited Golcar for the purpose of opening the new Sunday-school premises erected on the site on which stood the old chapel, built in 1834. The school contains thirteen classrooms, infants' schoolroom, secretary's room and library, and an assembly-hall 76ft. long by 36ft. 6in. wide. A reading-room and a conversation-room and gymnasium are also provided for the young men. The floors throughout are laid with wooden blocks on concrete. The front elevation is in the Renaissance style, built of Elland Edge pitch-faced wall-stones and Crosland Hill ashlar dressings. The internal joiners' work is of pitch-pine, varnished; the roof is covered with blue Westmoreland slates. Accommodation is provided for 700 persons. The work has been executed by the following contractors, viz.:—Masons, Messrs. A. and T. Haigh, Golcar; joiner, Mr. William Lockwood, Golcar; plumber, Mr. John Marsden, Huddersfield; slaters, Messrs. T. Longbottom and Sons, Huddersfield; ironwork, Messrs. G. W. Crosland and Co., Huddersfield; plastering and painting, Mr. Wilson Armitage, Golcar; wood block flooring and concreting, Mr. John Cooke, Huddersfield; heating apparatus, Mr. F. Milan, Huddersfield; electric bells, Mr. Fred Taylor, Golcar. The work has been carried out from the designs and under the superintendence of Mr. J. Berry, architect, 9, Queen-street, Huddersfield.

MANCHESTER.—A sitting of the Consistory Court for the diocese of Manchester was held on Friday before Chancellor Vernon Smith in the Derby Chapel, at the Cathedral. A faculty was provisionally granted at St. Michael's, Flixton, to take down the east walls of the chancel and south aisle, to open out the present vestry, form a clergy vestry and organ-chamber south of the chancel, and carry out other alterations. The Chancellor granted faculties for the following purposes:—For the placing of stained glass in the west-end window of St. Clement's, Urmston; for the placing of stained glass in a window on the south side of the church of St. James-the-Less, Ancoats; for the removal of the choir organ and seats and other alterations at St. James's, Oldham; to erect a chancel-screen at St. Mary's, Balderstone, Rochdale; to place three stained-glass windows, with Scriptural subjects, in the chancel of St. Anne's, Edgeside; to remove and replace the roof of the church of Heapey, near Chorley, put in a window, and erect a new porch; to place a stained-glass window on the north side of St. Mary's, Crumpsall; to erect a gallery for the ringers in the tower of the parish

church of St. Lawrence, Chorley, and a wooden screen, and to remove portions of pews; to replace choir seats in the chancel of St. Paul's, Withington, and erect a sedilia and choir-organ; to place a marble tablet on the wall of the north side of the church of St. John the Evangelist, Hurst; and to erect a credence in the north wall of the chancel of St. Edmund's, Falinge.

NEWCASTLE-ON-TYNE.—A new Exchange is about to be built at the centre of the Quayside, on the site of the Three Indian Kings and other properties, with a frontage of 50ft. The entrance leads to a vestibule, 20ft. wide by 39ft. long, the height being 18ft., from which one door opens to the newsroom and another to the exchange. The newsroom will be 28ft. wide by 44ft. long by 18ft. high, and will have four large windows facing the Quayside, in addition to which north light and ventilation are obtained over the telegram recess. The exchange hall occupies the major portion of the site, having a floor area of 5,115sq. ft. The proposed height is 30ft. to the ceiling; the domes spring from this line 10ft. higher. The lighting will be principally from the top, by means of three large domes, 24ft. diameter, each surmounted by automatic ventilators, to prevent down draught. In addition to this there will be large windows at each end of the hall, near ceiling, so that expensive mechanical arrangements for ventilation can be dispensed with. There are no columns in the centre of the hall, and the floor is level throughout. The secretary's office opens out of hall, through the clerks' office, which is top lighted. A door at north end of hall gives access to the board-room, 28ft. by 17ft. and 16ft. high, with top light and ventilation, and having an open fireplace. This room could be used during 'Change as a conversation or smoke-room if desired. A smoke-room or luncheon-room, and with a service-pantry, with lifts, are also provided. Mr. Charles T. Marshall, M.S.A., 4, Northumberland-street, Newcastle, is the architect.

SWANSEA.—The Vicar writes that "the parish building committee have made preparation to go on with stage 2 (the chancel, tower, and vestries) at once. The total sum paid in is £15,000, being £14,000 to cover the nave and £1,000 towards stage 2. In order to go on without a break in the rebuilding, £2,000 must be paid in immediately, in order to complete the £3,000 which the chancellor of the diocese requires to be in hand before he signs the permission to take down the old chancel." The new nave was opened by the Bishop of St. David's yesterday (Thursday).

A new bridge, which has been constructed at Port Sunlight, across a tidal arm of Bromborough Pool, was formally opened on Wednesday week by the Right Hon. George H. Reid, Premier of New South Wales. The new bridge, which connects a portion of Port Sunlight Village with the high road running from Birkenhead to Chester, has been named the Victoria Bridge, and is in one arch of masonry of 100ft. clear span. It has been built from plans by Mr. William Owen, and will add greatly to the convenience of the inhabitants of the village, in which there is now a population of 952 living in some 350 model cottages.

A Local Government Board inquiry on the Cheltenham Municipal Buildings Scheme was held on Thursday and Friday in last week. Mr. E. R. Robson, F.S.A., of London, architect to the Education Department, who prepared the plans, said the buildings would be in one block, with a frontage of 120ft., and have four public entrances. The whole of the eastern side and nearly half of the front would be for administrative purposes, and the remainder for a kursal and pump-room, which was estimated to cost £24,000—pump-room £21,000, and winter-gardens £3,000. The objections submitted by Mr. Gibbons on behalf of the opponents to the scheme were that the building was not to be erected on a proper site, and was extravagant, and that the majority of the ratepayers were against the scheme.

The contracts have just been signed for the north block of the new Admiralty buildings at Spring-gardens. It was to make way for this block that the clearance of the greater part of New-street was recently made. The new block, which will be occupied by the clerical staff, will be of about the same dimensions as that already completed, and of similar design, being from plans by Messrs. Leeming and Leeming, the architects of the first portion; but, as some of the ornamental features are to be omitted, it will be even plainer than the portion recently erected. All that now remains of New-street are some temporary Admiralty offices and the chapel.

Engineering Notes.

HUDSON RIVER IMPROVEMENTS.—Lieut.-Col. William Ludlow, Corps of Engineers, U.S.A., has reported to the United States Government regarding improvements in the Upper Hudson River. Before the improvements began, the navigable depth in the channel between New Baltimore and Albany was 7½ ft. at mean low water, and between Albany and Troy 4 ft. The result of the dredging has been to increase the width and depth of the shoalest portions to 250 ft. and 11½ ft. respectively. Between the railroad bridges at Albany the 12 ft. channel was widened to about 400 ft., then to the Breaker Island rocks the 12 ft. channel is from 200 ft. to 400 ft. wide. The channel from Breaker Island Rock to the lower side cut of the Erie Canal, at Fort Schuyler, is 12 ft. deep at mean low water for a width from 40 ft. to 120 ft. The cost of the improvement under the present project is about 2·3 per cent. of the value of the commerce benefited.

CHIPS.

The memorial window to the late Bishop Thorold in the Lady Chapel of Winchester Cathedral, which is being filled with stained glass, from designs by Mr. C. E. Kempe, will be dedicated to-morrow (Saturday) afternoon by Bishop Barry.

On Saturday afternoon a new Primitive Methodist church and schools in Park-road, Blackhill, were opened by the Mayor of Newcastle-on-Tyne. The total cost of the building (exclusive of the site) is about £3,000. The church, which will seat 200 people, measures 67 ft. by 43 ft., its height from floor to ceiling being 31 ft. In the schoolroom adjoining there is provision for 400 children. The designs were prepared by Mr. George Race, of Westgate, Weardale, and the work carried out under his supervision. Mr. William Whitfield, of Elm Park, Medomsley, was the main contractor; the joiner work was done by Mr. Race; plumbing, Mr. L. Urwin, Shotley Bridge; painting, &c., Mr. Surtees Leslie, Shotley Bridge; and the plastering, cementing, &c., Mr. David Ormerod, Blackhill.

The park which has been presented to the borough of West Bromwich by the Brothers Kenrick will be opened on August Bank Holiday. The total area of land, which is situated near the boundary dividing Smethwick and West Bromwich, is about 20 acres. The land has been inclosed with an iron fence. Provision has been made for cricket and football, two separate spaces having been prepared and set apart for those games. Trees and shrubs have been planted somewhat plentifully, and a number of walks have been made. In the centre of the grounds a space has been reserved for the erection of a band-stand. The work has been carried out from plans prepared by Mr. J. T. Eayrs (formerly surveyor to the corporation), and under the supervision of his successor in office, Mr. A. D. Greatorex.

The Markets Committee of the Leeds Corporation met on Monday to consider the question of the provision of a wholesale meat market and abattoir for the city. In connection with the new building schemes to be carried out in Briggate and the adjoining streets, the property known as "The Shambles" will be removed. Estimates prepared by the city and waterworks engineer, Mr. Thomas Howson, were considered, from which it appeared that a wholesale meat market and abattoir could be erected on the ground at present occupied as a pig market and a hay and straw market for the sum of about £24,000. The land, which already belongs to the corporation, is between 3,000 and 4,000 square yards in extent, and its value is estimated at £6,000. The committee decided to ask permission of the city council at its next meeting to erect a wholesale meat market and abattoir on the site named. Should the necessary sanction be obtained, they will advertise for plans and estimates, for which they will offer premiums, and it is their intention to proceed with the work as soon as possible.

In the Fine Arts section of the Brussels Exhibition first-class medals have been awarded for painting to Mr. Dicksee, R.A., Mr. Herkomer, R.A., Mr. Hook, R.A., Mr. Gregory, A.R.A., Sir J. D. Linton, Mr. J. W. Waterhouse, R.A., Mr. Seymour Lucas, A.R.A., and Mr. Sargent, R.A.; and for sculpture to Mr. Onslow Ford, R.A. Second-class medals for painting have been awarded to Mr. Solomon A.R.A., Mr. L. Lavery, Mr. Murray, A.R.A., Mr. North, R.A., Mr. Orchardson, R.A., Mr. Aumonier, Mr. Green, Mrs. Allingham, Mr. Oulless, R.A., and Mr. Clausen, A.R.A.; for sculpture to Mr. Frampton, A.R.A., and Mr. Drury; for engraving to Mr. Cameron; and for architecture to Mr. J. L. Pearson, R.A. One of five gold medals in the Fine Arts section has been voted to Mr. Alma-Tadema, R.A.

COMPETITIONS.

BRISTOL.—At their last meeting, the city school board considered the report of the sites and buildings committee. With respect to Hotwells infants' school competition plans, eight sets of plans were sent in, and, after careful inspection of same, it was decided to recommend that the set numbered 4 be adopted. The set of plans was adopted, and proved to be those of Messrs. Latrobe and Weston, 20, Clare-street, Bristol.

CARDIFF.—The corporation held a special meeting on Thursday in last week for the purpose of considering the sites upon which the new municipal buildings and law-courts shall be erected in Cathays Park. It was unanimously decided to rescind the resolution, passed on the 14th of June, "That a new town-hall and law-courts be erected in Cathays Park at the southern end of the western side thereof," it being explained that since their last meeting it had been ascertained that the proposed site would not provide sufficient width for all the proposed buildings, the Marquis of Bute having stipulated in selling the park that the present double avenue of trees should not be cut down. On the recommendation of a committee, it was further agreed that it will be advisable to erect the law-courts upon the site between the western avenue and North-road, and the municipal buildings on the eastern side of the avenue. The competing architects would then have an absolutely free hand as to area and elevation and as to the arrangement of the site, so that the best designs their genius could devise compatible with the money voted would be forthcoming. It was agreed to provide an additional room for solicitors at the proposed law-courts, and also a refreshment-room and small kitchen, a reporters'-room and deputy mayor's parlour. Alderman Carey, the chairman of the committee, said so many additions had been made that he would propose that the limit of expenditure be increased from £200,000 to £225,000. The borough engineer, Mr. W. Harper, thought £200,000 was sufficient, and the motion was then withdrawn. The instructions for architects were amended slightly, the time for sending in designs being extended, on the recommendation of the assessor, Mr. A. Waterhouse, R.A., from October 31st to December 4th, and the 5 per cent. commission to the successful architect will not include travelling expenses, and the committee's minutes were then approved with the alterations made therein.

NEW YORK.—About one hundred designs were received in the preliminary competition for the New York Public Library. Twelve of these are to be selected by the judges, who are Prof. Ware, of Columbia University, Dr. John S. Billings, the director of the new library, and Mr. Bernard R. Green, of the Congressional Library. The authors of the six of these twelve designs which are adjudged the best will compete a second time, and six architects of reputation, who have not entered the first competition, will be invited to compete with them. From the twelve designs of the second competition the judges will select three, and the trustees will choose, from these three, the person to whom they wish the execution of the building to be entrusted. It is estimated that the cost of the building will be about £340,000 sterling.

The Local Government Board have formally approved the scheme of drainage for the north-end district of Gloucester, prepared by Mr. J. Fletcher Trew, M.S.A., and a loan of £10,000 has been acquired to carry out the work. The engineer for the disposal works is Mr. E. W. Ives, C.E., of Derby.

Considerable improvements, necessitated by the great increase in traffic, are in course of progress at the Midland Railway Goods Station, Coventry. Increased accommodation has long been wanted in the offices, cattle-docks, furniture-van, carriage, and horse departments. The offices are being brought into line with those of the London and North-Western Railway Company; they will have a substantial brick frontage, and the clerical staff will have improved facilities for the discharge of their duties. Mr. Charles G. Hill, of Coventry, is carrying out the alterations.

The Birmingham Corporation have approved plans for public baths in Green-lane, Small Heath, on a site adjoining the free library. The estimated cost is £25,000, and the first-class and second-class baths will each have a water area of 81 ft. by 33 ft., and there will also be 17 private bath-rooms in each department, and a swimming club room.

PARLIAMENTARY NOTES.

THE NATIONAL GALLERY.—Dr. Farquharson asked the First Lord of the Treasury on Friday whether his attention had lately been directed to the danger of fire to the National Gallery from its close proximity to other buildings; whether, following the precedent in the case of South Kensington Museum, he would obtain a report from some well-known expert as to the nature and extent of that danger; and when the long-promised removal of St. George's Barracks would take place. Mr. Balfour: The answer to the first part of the question is in the affirmative. The answer to the second part is in the negative, as Sir J. Taylor has recently made an exhaustive report on the subject. The plans of the new barracks at Millbank have been approved, and will be proceeded with. Upon their completion, the removal will take place. Mr. Arnold-Forster: Will that include the recruiting depot as well as the barracks? Mr. Balfour: I understand that it will not.

SOUTH KENSINGTON MUSEUMS.—Sir, S. F. Powell asked the Secretary to the Treasury on Monday what steps the Government proposed to take with reference to the recommendations of the Select Committee on Museums for securing the buildings at South Kensington against danger from fire. Mr. Hanbury: This question would be more properly addressed to the First Commissioner of Works than to me. But I may state that the additional Estimate circulated some days ago provides for the immediate expenditure of £5,000 for the removal of the more dangerous structures on the east side of Exhibition-road, for the removal of the boilers and electric-lighting plant, the displacement of the occupants of the official residences, and the reconstruction of the entrances to the Southern Galleries, on the west side of Exhibition-road.

At Stonehouse, a hall has been added to the Free Church buildings at a cost of £1,000. Mr. George Coutts, of Aberdeen, was the architect.

Further improvements are about to be carried out at the Birkenhead docks, the Mersey Board having at its last meeting voted a sum of £2,300 for the repavement of a portion of the Tower-road.

A special meeting of the Herefordshire County Council was held on Saturday afternoon, for the purpose of considering a request from the committee of visitors to the lunatic asylum at Burghill, that they be allowed to engage the county surveyor (Mr. Wakelam) when they considered his services would be useful, and to remunerate him for such services. The requests were acceded to.

A large co-operative wood pulp and paper mill is about to be constructed at the Angerman River in North Sweden. All the larger sawmills in the district are interested in the concern, and it is intended that the plan shall also comprise kindred manufactures, which can utilise the residue from the saw-mills, and in the manufacture of turpentine and briquettes, &c.

The Roman Catholic Church of St. Francis Xavier, Oldbury, has lately undergone a complete renovation. A scheme of decoration has been carried out, after the designs of Mr. J. A. Pippet, of Messrs. Hardman, Birmingham. The walls and ceiling have been frescoed; the painting in the sanctuary consisting of a high dado of terracotta and dark red with gold *fleurs de lis*, while the upper part of the wall is powdered with lilies interwoven with the motto of St. Francis Xavier, *Satis est, Domine, satis est*. A Rood beam has been erected with a Crucifix and figures of Our Lady and St. John, while on either side of the entrance to the sanctuary are placed, in canopied niches, images of the Sacred Heart of Jesus and of the Blessed Virgin with the Divine Child. These figures are all carved in wood and richly decorated, and were made to order by Ferdinand Demety, of St. Ulrich, Gröden, Tyrol. The church has also been adorned with a new set of Stations of the Cross.

A dedication service of the newly-decorated chancel of St. Luke's Church, Barton Hill, Bristol, was held on Friday evening. The chancel was erected three years ago in commemoration of the jubilee of the church, but remained in an unfinished state. The chancel has now been decorated in a unique manner, on account of the central window of the apse being more than two-thirds blocked by buildings immediately behind. The stone tracery is seen complete in the interior, as in the two side windows, and the lower portion, which is unpierced for glazing, contains a picture of the Supper at Emmaus. Above this picture and still in the blank portion of the window are panels of canopy-work, also with gold background and labels containing the text, "Abide with us." The remaining third of the window which is open to the light, is filled with stained glass, consisting of two angels holding the text, "Peace be unto you." Above is depicted the Descent of the Holy Spirit. The walls are decorated with borders and patterns. In the space below the windows is painted arcading introduced to take the place of a reredos.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 60s. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 90c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXI. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX, XL, XLI, XLII, XLIII, XLIV, XLV, XLVI, XLVII, XLVIII, XLIX, L, LI, LIV, LVII, LX, LXI, LXII, LXIII, LXIV, LXV, LXVI, LXVII, LXVIII, LXIX, LXX, LXXI, may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

In response to complaints from readers that they are unable to get the BUILDING NEWS at Messrs. W. H. Smith and Son's bookstalls, we can only suggest that they should order the paper of some other newsagent. Messrs. W. H. Smith and Son recently requested us to allow them an extra discount beyond that allowed to the general trade, and because we declined that allowed to send the paper out to their bookstalls. We have, of course, no remedy; but we do not think the demand was a fair one.

RECEIVED.—O. J.—A. D.—T. B. and Co.—D. H.—W. S. W.—D. N. L.

Intercommunication.

QUESTIONS.

[11723.]—Legal.—A detached house, A, has its southern flank wall on the boundary of its own plot on that side. The passage to the rear of the adjoining premises, B, runs along this flank wall its whole length. Down this passage a new drain was laid. The passage being only 1ft. 6in. wide, the drain—assuming it to be in the centre, as it no doubt is—would be less than 2ft. away from the flank wall, whilst it is known to be 5ft. deep at the rear of the premises and 8ft. deep at the front. The drainage work was delayed by frost, and this kept the trenches open longer than it otherwise would have been. Very shortly after the drainage work was complete, cracks of considerable length and number appeared in the plastering and papering of ceiling and walls on the inside of the house A. This house had only just before had its ceilings whitened and walls repapered throughout. This operation would have necessitated the stopping of any old cracks, supposing any existed, so there is no question as to when the new cracks appeared. I am told that the owner of house A cannot proceed against the owner of the house B and get compensation, because: (1) house A has not been erected a certain number of years (20, I think); (2) no house has the right of support from adjoining land. Is this correct? I believe I saw a case reported not very long ago in which it was held (re point 2) that work done on land adjoining a house, and causing damage to that house, made the owner of the land (or he who did the work) liable for damage to the house. Am I right? And, what was the case?—C. H. B.

[11729.]—St. Mary-le-Bow Church, Cheapside.—Of what stone is the upper order of the steeple built? When viewed on a bright day, this portion has a slight pinky appearance.—S. T. M.

[11730.]—Portland Cement Plaster.—Will any

of your readers inform me of their experience in regard to plastering Portland cement in thick over a layer of concrete composed of broken brick or stone and lime mortar? I have seen this work frequently done for the flooring of bungalows, and noticed that after a short period the cement plaster cracks and breaks off, and that there is no affinity between the chunam and cement. I hear that Mr. R. F. Chisholm, F.R.I.B.A., now of Baroda, has always insisted that a layer of brick or tile should be placed over the concrete and then plastered with cement. I wish to invite attention to this because I see what I think is an objectionable practice recommended in page 198 of the new edition of Jones's "Manual of Sanitary Engineering," which contains much valuable information in other respects.—G. D. D., Madras.

[11731.]—Specifications.—Are there any practical treatises on specifications from which one can obtain the proper clauses for such work as plumbing, leadwork on roofs, heating apparatus, and other subjects? Those published in Gwilt and other books are too general or out of date.—YOUNG ARCHITECT.

[11732.]—Strains on Structures.—Which is the best elementary handbook on this subject, suitable for a beginner?—A STUDENT.

[11733.]—Glazed Roofing.—There are so many systems in the market and advertised, that it is bewildering to select the one that is found to be reliable in all points, allowing for expansion by heat and security against wet. Will any practical reader give his experience?—CONSERVATORY.

[11734.]—Repairing Buhl Table.—I have become possessed of a card-table of a make known, I think, as "Buhl." It is covered with inlaid work of thin brass fastened down with cement, and very thin tortoise-shell laid on a scarlet cement. Parts of the brass are missing, and I want to replace them. I can cut out the brass sheet for this, I think, but should be glad of any hints on this, and on engraving the scroll-work on it. What cement is used to fasten down the brass on the wood of the table? When originally made, was the brass polished bright and lacquered, or how was it and the tortoise-shell finished? What is the red cement backing the tortoise-shell, and how is it applied?—J. BROWN.

[11735.]—Sawing Stone.—Will some reader help me out of a difficulty? I am often sawing stone with sand and water, and my man cannot go down square although the stone is level. What I thought about is putting a piece of iron or steel each side of the saw and at each end; but I want to know how to fasten it there as the stones vary in thickness from 3in. to 1ft., and I want it so as it can be taken on and off quickly.—MASON.

REPLIES.

[11691.]—Party Walls.—I am sorry my reply to "H. E." was of no use. To say "What are the privileges of either party as to raising or otherwise with the wall or chimney-stacks," would be to write a treatise on a rather difficult question. Where the ownership of party-wall is not known, the two parties are tenants in common. Acts of ownership establish this tenancy. Either of the owners of a party-wall, where each has a moiety exclusively, can pull down that part of wall standing on his own land where the wall is not common property. In many instances there is an easement of support, and in this case he would be liable. The owner of dominant tenement can build on the wall so long as he does not endanger its stability. The third meaning or definition given—i.e., when the wall belongs to one of the adjoining owners, but is subject to an easement on the other to have it maintained—is that which is generally the meaning in the Building Act. With regard to two tenants in common, one tenant may pull down and rebuild; but he may be subject to an action for damage.—G. H. G.

[11683.]—Elliptic Arch.—Let A, B, C, D, be the axes of an ellipse, of which O is the centre; draw BE parallel to OC, and CE parallel to OB; bisect BE in F and OB in G; then the intersection of CF and DG gives a point,

P, on the true ellipse, which has the given axes. Bisect CP perpendicularly by the line HK, meeting CD at K; then K is the centre of an arc of a circle which will pass through C, P, and a point, P₁, similarly situated on the other side of OC; describe this arc, and continue it to L to meet KL, drawn parallel to OA; join LA, and produce to meet the arc PCL at M; join KM, cutting OA at N; with N as centre, and NM as radius, describe an arc; this will pass through A (since NA = NM), and will, with the arc MC, make up the quadrant CP, MA of the approximate ellipse. The remainder of the curve may be drawn by symmetry. It should be noticed that the points P, P₁ are not necessarily the points at which the large and small arcs join. The proof that NA = NM is simple; for the triangles MKL, MNA are similar; therefore NM : NA :: KM : KL. But KM = KL; therefore NM = NA. This will show "J. W. S." how to

find geometrically the centres which he says he finds by trial. The above will give a result which differs but little from that obtained by "J. W. S.'s" construction. Lack of time prevented an earlier reply.—J. C. PALMER.

[11709.]—Slates.—If the querist will communicate with us, we can give him the information he desires.—J. DUCKETT AND SON, LTD., Blannel-street Works, Burnley.

[11712.]—Trigonometry.—Let the height of the tower be h feet, and the distance at which it was first observed x feet; and let θ° be the angle of elevation at the first observation. Then we must have—

Distance for second observation = $(x-a)$ feet
Distance for third observation = $(x-a-b)$ feet
Angle of elevation for third observation = $(90-\theta)^\circ$

Now, the second observation gives—

$$\frac{h}{x-a} = \tan. 45^\circ = 1;$$

$$\therefore h = x-a$$

$$\therefore x = h+a \quad \text{.....(1)}$$

The first observation gives—

$$\frac{h}{x} = \tan. \theta^\circ \quad \text{.....(2)}$$

The third observation gives—

$$\frac{h}{x-a-b} = \tan. (90-\theta) = \cot. \theta^\circ = \frac{1}{\tan. \theta^\circ}$$

$$\therefore \frac{x-a-h}{h} = \tan. \theta^\circ \quad \text{.....(3)}$$

(2) and (3) give $\frac{h}{x} = \frac{x-a-h}{h}$

$$\therefore h^2 = x(x-a-b).$$

In this equation, substitute for x the value obtained in (1). Thus—

$$h^2 = (h+a) [(h+a) - a - b]$$

$$= (h+a) [h-b]$$

$$= h^2 + ah - bh - ab.$$

$$\therefore (a-b)h = ab. \quad \therefore h = \frac{ab}{a-b} - Q.E.D.$$

—J. C. PALMER.

[11712.]—Trigonometry.—Let BC = height of tower = x , let A be the first station, D the second, and E the third, ADEC being a straight line, and ACB being 90° ;

then by hypothesis AD = a and DE = b . Also, since BDC is 45° , CD = CB = x . Let angle BAC = α = CBE, since CBE is the complement of BAC. Now tan. BAC = tan. α = $\frac{x}{a}$; also tan. CBE = tan. α = $\frac{x-b}{b}$.

Hence, equating the two expressions for the value of tan. α —

$$\frac{x}{a} = \frac{x-b}{b}$$

$$\therefore x^2 = (x+a)(x-b)$$

whence—

$$x(a-b) = ab$$

and—

$$x = \frac{a \cdot b}{a-b}$$

which gives the required height of tower.—H. BUSBRIDGE.

[11714.]—Measuring Stonework.—The method shown in sketch of block of stone, showing how they are cut out, appears a reasonable mode of cutting the mullions. If the stonemason adopts a more wasteful method, he is responsible. As a method of measurement, I think the stonemason's contention is right, as he might have cut each from a block of stone, and this is the way he would probably go to work.—A READER.

[11716.]—Overflowing Cistern.—I think the ball-tap is out of order; most likely the leather is worn out, or the lever may have become fixed. A plumber would soon mend matters.—G.

[11718.]—Spires and their Construction.—I think "Pro Re Nata" will find the subject treated in Gwilt and any recent book on masonry. Sometimes the joints are horizontal, forming so many rings divided by horizontal planes, but there are spires in which the joints are cut at right angles to the taper of spire. I should prefer the latter plan, as then each course forms a self-tied ring.—G. H. G.

[11719.]—Drain-Pipe Joints.—Get particulars of Doulton's "patent self-adjusting joint." The pipes can be laid in any sort of ground, as any subsidence will not affect the water-tightness of joints. No cement is required. Stanford's joint is a good one.—G. H. G.

[11720.]—Gauged Brick Arches.—A cut key-brick is generally used, the soffit being cut to a point. For setting-out gauged arches, see the treatise on "Brick-work" in Crosby Lockwood's series.—SUB.

[11721.]—Dry-Rot in Timber.—It is doubtful whether any remedy will arrest the dry-rot short of cutting out the timber and the affected plaster-work. A solution of corrosive sublimate in water, in the proportion of 1oz. to a gallon, used hot, is recommended; or a solution of sulphate of copper, 1lb. to a gallon, applied hot. Paraffin oil is said to stay the rot. If the decayed timber can be removed, the best remedy is to cut it out. The subject is a difficult one, and even experts are as uncertain as to the best treatment of this disease as the

medical man is in his treatment of cancer. The preventive rule is the safest: "Season and ventilate."—A. Z.

[11723].—**Flushing Cisterns.**—I know of no flushing cistern equal to the one recently patented by Mr. Thos. Clark, of Orchard-street, Weston-super-Mare. It is a lead-lined and lead siphon, wood-cased; the water is siphoned direct from the cistern without passing through any other connection, and it will work with the handle held down or let go. This cistern has been selected by the architects in the recent alterations of our town-hall, schools, and dwelling-houses in the town and district. I have heard and seen letters speaking very highly of them, and at a reasonable cost.—CHARLES LAKE.

CHIPS.

Mr. Edward L. Lutyens, architect, of 16, Onslow-square, S.W., son of Captain Charles Lutyens, of Thursley, Godalming, and 16, Onslow-square, was married on Wednesday to Lady Emily Bulwer-Lytton, youngest daughter of the late Earl of Lytton, and sister of the present peer, of Knebworth House, Stevenage, Herts. The ceremony took place at St. Mary's Church, Knebworth.

Two blocks of richly carved and traceried seating and a prayer desk, all in handsomely-figured English oak, have recently been fixed in the chancel of the parish church of Stoke Gabriel, Devon, for the Ecclesiastical Commissioners, from designs by Messrs. Christian, Caröe, and Purday. The work has been satisfactorily carried out by Mr. W. Dart, Ecclesiastical Art Works, Crediton.

The town council of Stirling have under consideration an offer by Mr. Andrew Carnegie to provide £6,000 for building a suitable free library building if they see fit to adopt the Public Libraries Acts.

At the half-yearly meeting of the Metropolitan Railway Company, held last week, Mr. Bell, the chairman, stated that the company had a considerable amount of land at Willesden Green and Pinner, and they thought the time had arrived when this could be developed for building purposes. If they were able before long to make arrangements for building on the land, it would make a very considerable increase to their annual revenue. The committee had now been in office for 10 years, and during that period their rental had increased from £69,800 to £78,000, an increase of about £8,000 per annum.

Mr. W. O. E. Meade King, inspector of the Local Government Board, held an inquiry at Cheadle, on Friday, touching the urban district council's application to borrow £2,150 for private street improvement, and £500 for furnishing a public recreation ground with shelters, seats, swings, &c. It was explained that the ground had been presented to the council, and that this was the first expenditure of public money upon it. There was no opposition.

Some important further discoveries of Roman remains have been made in Shoemakers'-row (Northgate-street), Chester, where some old property has recently been pulled down. Close to the moulded base of a Roman column (*in situ*) and a detached portion of its shaft, mentioned by us last week (p. 134), Roman tile fragments have also been discovered, a heap of coins, and still more interesting the fragment of an altar bearing the letters Q E N I O V V E T V E T. The supposition is that the altar was dedicated by a veteran of the 20th Legion to Valeria Victrix. Another find is a carving in red sandstone, showing the face of a Roman, with antique headdress.

A largely attended meeting of architects, builders, and others interested in the building trade, was held at Sunderland last week to consider the action of the building committee of the corporation with respect to the framing of new by-laws. Mr. Robt. Hudson, builder, presided. Mr. Wm. Milburn, architect, secretary to the Architects' and Builders' Committee, explained what had been done, and what concessions had been made, and on the motion of Mr. J. W. White, builder, seconded by Mr. James Henderson, architect, and supported by Mr. Foster, solicitor and secretary of the Land Owners' Property Association, it was resolved "That this meeting of architects and others interested in the by-laws as proposed by the building committee to apply to new buildings and streets, strongly urge upon the corporation to agree to the amendments unanimously adopted by the committee of architects and builders of this town."

The urban district council of Llandudno have decided to apply for power to borrow £8,633 for carrying out the first portion of the scheme for the extensions of the water-mains. They have also resolved to proceed with the erection of the new municipal buildings in Lloyd-street, instructions being given to the architect to keep the outlay as near £12,000 as possible.

Mr. John Lee, son of Mr. Wood Lee, architect, Bramley, has just passed his second examination at the Royal Academy, and has been duly admitted as an art student for three years. Mr. Lee was formerly a pupil of Mr. Alfred J. Sturges, architect, of Town Hall Chambers, Guildford.

LEGAL INTELLIGENCE.

BREACH OF BUILDING BY-LAWS.—At Plymouth Police-court, on July 28th, Anthony R. Lethbridge, contractor, Tracey-street, Plymouth, a member of the board of guardians, was summoned by the Plymouth Corporation for five breaches of the building by-laws.—The town clerk said the offence was deliberately committed and persisted in under circumstances which aggravated it materially. The defendant was summoned for erecting premises at the rear of five houses in Britannia-terrace, and not leaving the 15ft. of open space from the houses to the boundary wall required by the regulation. In March, 1896, defendant submitted plans of the proposed erections, but they were not passed, as they did not provide for the proper amount of open space. Defendant proceeded with the work, and an action was brought against him. As defendant said it was a test case, and he intended to appeal, he (the town clerk) agreed to the infliction of a merely nominal penalty. Defendant did not appeal, but altered the lane to the requisite width, but the yard space was still inadequate. On the 19th July, when the inspector visited the premises, defendant used most disgraceful language. Under these circumstances he (the town clerk) was bound to ask for an adequate penalty. The case was proved by Charles John Read, building inspector; Ernest Scown, borough surveyor's department, and Mr. Paton, borough surveyor. Defendant was fined £2 and costs in each of the five cases.

THE INTERNATIONAL SOCIETY OF AUCTIONEERS AND VALUERS.—A sitting for the public examination of the directors and others connected with this company was held on Friday before Mr. Registrar Hood at Bankruptcy Buildings, Carey-street, W.C. The society was registered under the Companies Act, 1862, as the Institute of Auctioneers and Valuers, on November 12, 1895, for the purpose of providing an organisation for auctioneers and valuers with the view of promoting the interests of both professions, and doing all such things as from time to time might be thought necessary or advisable to elevate the *status* and tend to the advancement of these professions. The liability of members of the society is unlimited. Mr. J. H. Wilkinson was the promoter of the undertaking. Mr. Samuel Wheeler attended as Official Receiver. Mr. B. A. Spaul, who described himself as an inventor, said he became a director of the society at the request of Mr. Wilkinson. He was neither an auctioneer nor a valuer at the time of the incorporation of the society, although he had had about three years' experience. He felt satisfied that the institution was a bona-fide one, and felt that it satisfied a great need. By the Registrar: To a certain extent he joined the company in order to get his fees. Continuing, witness said he did not know at the time he became a director that the liability was unlimited; he did not make any inquiries in connection with that subject. He knew that Mr. Wilkinson had promoted several institutions for the benefit of other professions. Witness had no personal interest in the society, and was not even a member. He adopted an agreement dated November 19, 1895, under which Mr. Wilkinson, who was appointed president of the society for 20 years, at a salary of £250 a year, was entitled to a payment of £5,000 by way of liquidated damages, should he be discharged by the society on any ground other than that of gross misconduct, or should the society go into liquidation. On March 25, 1896, an agreement was entered into, whereby Mr. Wilkinson agreed to resign his position, and to accept from the society £500 in debentures, in lieu of the £5,000. Witness thought both agreements were reasonable. He understood that if less than 2,000 members joined the society, the amount payable to Mr. Wilkinson would be reduced. Previously to August, 1896, three prospectuses were issued by the company. The Official Receiver: Would any person reading any one of those three documents find any statement to the effect that the liability was unlimited? Witness said they would not. Mr. Wilkinson retired because Mr. Luwee Harris, another director, desired to be appointed president, as he could bring the society into a stronger position. By Mr. Forbes: The redemption of the debentures for £500 issued to Mr. Wilkinson was spread over a period of ten years. Mr. H. F. McDowell was next examined, and in reply to the Official Receiver stated that his business consisted of acting as secretary to public companies. When the society was formed he was in his 22nd year. He denied that he was practically a clerk in the employ of Mr. Wilkinson, but he admitted that there was an arrangement between that gentleman and himself whereby he was to have the option of accepting secretaryships offered to him. He resigned in March, 1896, and during the time he occupied the post of secretary no prospectus was issued showing under which section of the Companies Act the Society was registered. The Official Receiver: Did you ever insert the word "limited" upon a member's certificate? Witness said he had never done so, nor had he any knowledge of such an act being committed. Mr. Luwee Harris, in reply to the Official Receiver, stated that he was an architect,

and was asked by Mr. Wilkinson to become a director, and he consented to do so. He did not become aware that the liability was unlimited until the early part of last year. Witness succeeded Mr. Wilkinson as president of the society. The society did not then number more than 50 members. Some further evidence having been given, the proceedings terminated.

EXTRAS AND DELAYS.—At the Wellington, Salop, County-court, on Tuesday week, his Honour Judge Harris Lea held a special court to hear an action in which Charles Davies, builder, Wellington, sued Mrs. F. A. Newbould for the sum of £74, balance in respect of a contract for erecting two houses on Constitution-hill, and there was a counter-claim for £136 for defective building. Mr. Daniel represented the contractor, and Mr. Burke appeared for Mrs. Newbould. Mr. Daniel explained that the contract for the building provided that Davies was liable to a penalty of £3 each week the work was continued beyond the time specified. The houses were to have been completed by the 31st August last year, but there were extras ordered, which accounted for delay, and possession was not given until October. Mrs. Newbould's original claim against the contractor amounted to about £19 10s., but since the commencement of these proceedings a claim was made for the penalty to which he contended Davies was not liable after he had been requested to undertake extra work. Plaintiff stated that last year he contracted to build two houses for Mrs. Newbould on Constitution-hill for £758. A specification was drawn up and an agreement entered into providing that the building should be completed within four months, immediately after commencing the foundations, the architect instructed him to do something to them that was not provided for, and he was allowed the sum of £5 10s. for the extra work, which occasioned two or three days' delay. There were other extras which caused the completion of the work to be postponed about a fortnight, and Mrs. Newbould herself was the cause of further delay by frequently interfering with the men. She was constantly on the ground, and nearly lived there, and he was obliged to ask her to desist. From time to time the architect called his attention to certain defects, and on July 31, in reply to a letter from witness, he stated he could not give a certificate then, but would do so if the work progressed during the following fortnight. He attended to the defects complained of, and later he received £150. In February Mrs. Newbould was willing to pay the balance on the contract subject to a deduction of £19 10s.; but he would not consent to it. The defects were such that were likely to occur in any new house, and especially those in question, which were very much exposed. Some of the defects were not pointed out to him until he received particulars of the counter-claim. In cross-examination he admitted receiving complaints from time to time from the architect as to the woodwork, &c. Mr. H. Goddard, Wolverhampton, architect and surveyor, stated that he had examined the premises, and had seen some defects, but they were only such that would be occasioned in any new house after several months' occupancy. He estimated that £3 6s. would cover them all. William Dainty, foreman joiner for Mr. Nailer, Wolverhampton, who supplied the timber for the doors, &c., said it was in good condition when it left Wolverhampton. He thought £4 or £5 would cover all the defects. Mr. Burke, in addressing his Honour, drew attention to a long list of defects, and said that in consequence of the contract being broken in point of time his client was compelled to incur further expense. Mrs. Newbould stated that the contractor did not commence the work at the proper time, and she denied interfering with the workmen. She admitted, however, going often to see the progress of the work, as her garden was hard by, and complained of the conduct of Davies and his men towards her. Mr. W. Scott Deakin, architect, Shrewsbury, under whose superintendence the houses were erected, gave evidence as to the inferior quality of some of the work, on account of which he had complained to plaintiff both verbally and by letter. Mr. Spaul, architect, Oswestry, stated that he had inspected the houses and prepared a list of defects mentioned in the particulars of the counter-claim. He considered their value reduced by £100 in consequence of the inferior work complained of. On the conclusion of the evidence, his Honour intimated that he should reserve his decision.

The churches committee of Glasgow Corporation recently received an application from the kirk-session of Tron parish church to have the outside and the inside of the building put into a seemly condition. After carefully inspecting the property, the committee were of opinion that in view of the large sum which would be required to put the building in a proper condition, the most expedient course would be to entirely reconstruct the fabric on a smaller scale and with an entrance from Chisholm-street. A sub-committee was appointed to confer with the Presbytery and to report.

REMODELLING OF BURTON INFIRMARY.

THE accommodation in this building having of late years become inadequate to the requirements of the town and district, the land in the rear through to New-street was purchased with a view to the enlargement of the buildings. The hospital, originally built for some 17 beds, had gradually been enlarged till 60 beds were reached, the kitchen, out-patients', nurses', and servants' departments remaining much as before, and necessarily becoming most cramped and inconvenient. The general arrangement of the old building will be seen by the small plan. It was decided to retain the main-ward block, remodelling the interior and sanitary blocks, and altering the windows to suit the spacing of the beds; to rebuild entirely the kitchen in a detached block in the rear, with nurses' and servants' dining-rooms and nurses' bedrooms over, and in another block, towards New-street, new out-patients' and dispensary departments, with servants' rooms over; the mortuary and post-mortem room in another detached block. In order to insure a complete circulation of air round the old wards, it was also decided to rebuild the front block, detaching it in the same manner from the ward block, and on the ground floor of this block are the matron's and house-surgeon's rooms, committee and waiting rooms, while over is a women's ward for 10 beds, with duty-room and sanitary block complete. This front block is the gift of the Misses Ratchiffe, while Lord Burton, the late Mr. Worthington, and others have been most generous subscribers. The hospital, when complete, will accommodate 83 patients, 14 nurses, nine servants, and house surgeon and matron. As the work of the hospital is being carried on during the alterations, they have to be carried out in sections. The arrangement of the blocks in the rear allows a good space open to the south to be laid out as a garden for the use of the nurses and convalescents. The buildings are being carried out in red brick and tiles, with a little stone in the Duke-street block. The work is being very well carried out by Messrs. T. Lowe and Sons, of Burton-on-Trent, Mr. James Rice acting as clerk of the works.

ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.

(See descriptive article on p. 176.)

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

HAMPSHIRE FIELD CLUB.—The members of this club held a meeting in the Isle of Wight on Wednesday week. Meeting at Newport, brakes were taken to the foot of Mottistown Down, near Calbourne, and the party went up the valley to the Black-barrow, concerning which Mr. T. W. Shore gave information, derived from a Saxon charter, dated A.D. 826. In this document the Barrow is mentioned as one of the boundaries of Calbourne parish, and is called the Gemotburh. The visitors went on to the Longstone, an erect monolith, supposed to be of Celtic origin, standing on the side of Mottistown Down. There are, in fact, two stones, one being *in situ* and the other prostrate, and Mr. Shore expressed the opinion that both were at one time erected. Mr. Dale suggested that as these two stones were so close together, there was probably a third, the three being placed to form a dolmen. Mr. Shore stated that Sir Henry Englefield made a good drawing of the Longstone; but there was no modern view of it, not even a photograph, existing, so far as was known. Father Davis, of Cowes, read a short paper on the antiquarian features of the neighbourhood, particular reference being made to the Longstone, the Black-barrow, the entrenchment on Castle Hill, and the Saxon cemetery on Chessell Hill close by. The party proceeded to Mottistown Church, where they were received by the Vicar of Shorwell, the Rev. G. E. Jeans, F.S.A., who read a short paper. Mottistown Church dates from the 12th century, but was ruthlessly "restored" in 1863, nearly all its old features being destroyed, except a Jacobean pulpit. Mottistown Manor House was next visited, by permission of Mr. Charles Brown. The house dates from the early part of the 16th-century, and consists of two distinct buildings. The date 1567 is cut in stone over the entrance-porch; but this apparently refers to a remodelling of the house. There are some fine old oak doors and a stone staircase, and a stone cheese press, which stands in the yard near the dairy. The house was formerly the residence of the Glamorgans, and afterwards of the Cheke families. The party then drove on to Brightstone Church, which dates from the 13th century, returning to Newport, through Shorwell.

ROYAL ARCHÆOLOGICAL INSTITUTE.—The summer meeting of this Institute commenced at Dorchester on Tuesday. There was a large attendance of members, including Sir Henry Howorth, M.P., Professor Boyd Dawkins, Professor Clark, Mr. Mansel Pleydell, the Rev. Sir Talbot Baker, and General Pitt Rivers, the president for the year. The proceedings opened with a formal reception at the town-hall by the mayor of Dorchester, who welcomed the society to Dorchester. General Pitt Rivers, in his presidential address, made special reference to the exhaustive researches which he has personally carried out at Rushmore and the neighbourhood, dealing particularly with the bronze age; also to discoveries of flints in Egypt. In the afternoon the members perambulated the town under the guidance of Mr. H. J. Moule, the able curator of the Dorset County Museum, and visited the Roman amphitheatre known locally as Maumbury Rings, the oldest of the local churches, and the county museum. In the evening the antiquarian section was opened by Professor Boyd Dawkins with a paper on the "Present Phase of Prehistoric Archaeology." On Wednesday the institute visited Wareham and Corfe Castle, and yesterday (Thursday) the members were received at Sherbourne Castle by Mr. Wingfield-Digby, M.P. Last evening the members were entertained at a soirée by the Dorset Field Club. To-day (Friday) will be spent in the neighbourhood of Dorchester, when the interesting earthworks at Maiden Castle and Poundbury will be visited, and in the evening an architectural section is to be opened by the Rev. Dr. J. C. Cox on "The Treatment of Cathedral Churches in the Victorian Age." The hon. secretary of the Dorchester meeting is Mr. Mill Stephenson, and the hon. local secretary is Mr. H. J. Moule.

SOMERSETSHIRE ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society is being held at Bridgwater this week. The proceedings commenced on Wednesday morning, when the president-elect, Mr. E. J. Stanley, M.P., delivered an address, and the general business of the society was transacted. Subsequently, the Mayor of Bridgwater received the society at luncheon, and after visits to the parish church, the Castle, and

Water Gate, and Admiral Blake's house, the members met in the town hall for papers on local subjects and discussion. A second meeting was held for a similar purpose in the evening. Yesterday (Thursday) the members proceeded to Stoke Courcy, where the church and castle were visited, and thence to Dodington to inspect the Manor House. The entrenchments and the site of Stowey Castle having been examined under the guidance of the Rev. W. H. P. Grenwell, the party drove to Quantock Lodge, the residence of Mr. E. J. Stanley, M.P., who entertained the society to luncheon. Spaxton Church, Blackmore Farm, Brymore, and Cannington Church were afterwards visited, and on returning to Bridgwater in the evening Mrs. Holland gave a reception to the members. To-day (Friday) will also be devoted to excursions, and among the places to be visited are Chedzoy (traversing a district of special interest, owing to its being the site of the Battle of Sedgemoor), Weston Zoyland, Middlezoy, Othry, the site of King Alfred's Monastery, Lyng, and North Petherton. The excursions are under the direction of Lieut.-Col. Bramble, F.S.A., honorary general secretary, and Mr. E. Buckle has described the architectural features of the churches visited.

CHIPS.

A bust of the late Earl of Derby has been presented to the House of Lords by Earl Stanhope, and will be placed in the library.

The first wooden church built in Norway since the 13th century is that at Balholm, in the Sogne Fiord, which has just been dedicated.

At Cork a new church added to the Convent of St. Vincent, St. Mary's-road, has just been dedicated. It consists of nave and aisles, 75ft. by 52ft. across, side chancels, and sacristies. Mr. W. H. Byrne, of Dublin, is the architect, and Messrs. O'Flynn, of Cork, are the builders.

The new cottage hospital, Accrington, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Countess of Warwick opened, on Friday, her new secondary and technical school at Dunmow. The school is well situated, and fitted up to accommodate 100 pupils.

A Parliamentary paper has just been issued giving an additional Civil Service Estimate, Class I., for 1897-98. The amount is £10,000, and it is in respect of art and science buildings of Great Britain. The British Museum and the Science and Art Department buildings receive £5,000 each for new works, alterations, and additions. The total original net estimate for 1897-98 was £26,000, and this has been increased to £36,000. The increased grant to the Science and Art Department is on account of the cost of carrying out certain urgent works and services at South Kensington, designed to give effect to the recommendations made in the first report from the Select Committee on the museums of the Science and Art Department.

The committee of the Kirkdale Industrial Schools have appointed Mr. Edmund Kirby, of Liverpool, as architect for the proposed cottage homes. It is proposed that 14 cottages be erected, eight for girls and infants and six for boys, each cottage to accommodate 15 children; also a small infirmary for 30 children, and a schoolroom to accommodate 60 infants and 200 elder children.

On Wednesday week Archdeacon Stevens performed the service of benediction at the new vicarage house recently built at Chadwell Heath, near Ilford, Essex.

Colonel R. W. Slacke, R.E., an inspector from the Local Government Board, has held an inquiry at Ripley relative to the application of the urban district council to borrow the sum of £2,750 for the purposes of water supply, and £450 for private street improvement. It was proposed to supply Marehay, Hartshay, Waingroves, and Street-lane with water. There was no opposition.

At the last meeting of the Battersea Vestry a letter was read from a firm of solicitors with reference to the unequal distribution of the London hospitals, stating that one of their clients is prepared to contribute to the provision of a large general hospital the sum of £10,000, upon condition that the site of the hospital shall be in either of the parishes of Camberwell, Lambeth, and Battersea; that the contract for the erection of such hospital shall be entered into by a date not later than Aug. 1, 1899; and that no medical school shall at any time be formed or carried on in connection with the proposed hospital. The reading of the letter was received with applause, and it was resolved to refer the matter to the finance committee.

The enormous values which have been placed on hotel property in Blackpool recently have induced the corporation of that watering-place to apply at the forthcoming brewster sessions for a provisional order for the erection of a large hotel. The plans have been passed, and the hotel is to be built on land south of the promenade at South Shore, bought from the ex-Mayor.

WATER SUPPLY AND SANITARY MATTERS.

EASTBOURNE.—In consequence of the increase of the resident population of Eastbourne, as well as that of the summer visitors, an additional supply of water for the town became necessary, and the existing water company applied to Parliament this year for further powers to obtain a supply at Friston. The corporation at the same time promoted a Bill for acquiring the water company's rights, and for obtaining a new supply at West Dean. The preamble of this Bill, however, was not proved, and the water company's Bill was proceeded with. As the necessity for a fresh supply was most urgent in view of the approaching season, the committee gave a provisional intimation that the water company's Bill would be passed subject to the company giving an undertaking, under heavy penalties, that the new supply should be brought into Eastbourne by Aug. 1. The committee, moreover, consulted Sir Frederick Bramwell, F.R.S., upon the possibility or otherwise of this being done. In the result, Sir Frederick reported to the committee that it was possible for the company to carry out their undertaking, and on May 11 the preamble of the Bill was declared to be proved. The company at once entered into a contract with Messrs. John Aird and Sons for the construction of the necessary works. The contract was settled on May 19, and the works were started forthwith, and were carried out under the superintendence of Mr. Frank Stileman, M.Inst.C.E. The new supply is obtained from a well at Friston, which had already been partially sunk in the chalk. The present yield of this well is about 1,000,000gal. per day; but by sinking it deeper, and by driving galleries the yield can be increased to 2,000,000gal., or even 3,000,000gal. The pumping machinery at Friston consists of two pairs of engines and pumps. One is a compound condensing Worthington pump, fixed about 100ft. down the well, and which delivers the water into a tank at the surface. The second engine is a triple cylinder condensing Worthington pumping-engine, capable of delivering 1,000,000 gallons in 24 hours against a head of 500ft. of water. This engine is at the surface, and it pumps the water from the tank in which it is deposited by the first engine to Eastbourne through a 21in. main. This main is four miles in length, which is laid over Friston and Beachy Head hill, which route involves some very steep gradients. Arrived at Eastbourne, the water is delivered into two reservoirs at Mead's Hill, whence it is distributed to the town by gravitation. The pumping-engines have been fixed and tested and the mains laid by Messrs. Aird and Sons a week within contract time. The formal opening of the works is to take place to-day (Friday), when the mayor and corporation of Eastbourne will be present in state, and the new supply will be turned on by the Duke of Devonshire.

KILLIN, PERTSHIRE.—SEWERAGE AND SEWAGE DISPOSAL WORKS.—These works, which have been under construction during a year past, are now completed. The town has been re-sewered throughout, and the sewers are provided with manholes, flushing-tanks, and all the most recent improvements in sanitary practice. The sewage is treated by the International process, and the works are erected in the river-side park belonging to Lord Breadalbane, and situated south of the Killin Railway. The sewers are designed to deliver their contents by gravitation only, and every advantage has been taken of the ground for this purpose. The effluent passes into an open concrete channel, and thence by a system of outfall pipes into Loch Tay, so as to preserve the continuity of the grazing lands. Great satisfaction is felt at the successful result of these works, as they are a first instance of the treatment of sewage according to this system in the West of Scotland. The construction and design are of a novel character. The precipitation-tank is of brick, and is fitted with Condy's sludge-lifting apparatus, and the various chambers and the filter-cases are of concrete. The completion was commemorated by a ceremonial on Friday last, when the works were formally declared open by the convener of the county, Colonel Hope Drummond. The whole scheme has been designed and carried out by Mr. Woulf Brennan, C.E., of Oban, whose plans were preferentially selected by the district committee. The contractor was Mr. Bremner, of Portingall, Aberfeldy, and Mr. R. Cameron, of Edinburgh, was the clerk of works.

WORCESTER.—A special meeting of the City Council was recently held at the Guildhall, the Mayor presiding, to receive a special report of the Water and Sewerage Committee upon the question of the disposal of the city's sewage. The committee reported that they had had an interview with Messrs. Beesley and Sons with regard to their scheme, which was awarded first premium in the recent competition, and recommended its acceptance, if the Local Government Board sanction to a loan of £48,000 could be obtained. Alderman Ernest Day, M.S.A., proposed the adoption of this recommendation, which was carried, with the substitution of £52,000 for £48,000.

STATUES, MEMORIALS, &c.

WELLS CATHEDRAL.—The Bishops attending the recent Pan-Anglican Conference journeyed on Wednesday from Glastonbury to Wells for the purpose of attending the unveiling of a monument in the south aisle of the choir to the late Bishop, Lord Arthur Hervey. The monument is in the form of a tomb of veined alabaster polished, and stands upon a plinth of red marble. The body of the tomb is arched in five foliated and crocketed arches on the side and two at each of the ends, separated by traceried panels and buttresses canopied and crocketed; three of the side panels contain shields, the centre one bearing the arms of the see, those to the right and left respectively the arms of the Bishop impaling those of the see and the Bishop's arms impaling those of his wife. The base of the tomb is deeply moulded and enriched with carving; the top is a massive slab of alabaster richly moulded, and with elaborately carved paterae and bears a dedicatory inscription. Upon the tomb rests a recumbent effigy of the late Bishop by Mr. Brock, R.A. The inscription runs round the cornice of a slab of Derbyshire alabaster, which is the pallet on which the figure lies. The tomb was designed by Mr. J. L. Pearson, R.A.

CHIPS.

In the House of Lords, on Wednesday night, the Public Health (Scotland) Bill was read a third time, and passed.

The Queen has purchased at auction the riverside estate near Datchet known as Sandlea, comprising a residence and about 16 acres, for £11,500. The gardens and pleasure grounds are among the best in the locality. The property is within two miles of Windsor.

A recent office-building fire at Pittsburg, Penn., has occasioned a renewal of the controversy as to the respective merits of terracotta and concrete as a filling between iron beams for fireproof floors. In a recent report on the fire, made to the insurance companies, one set of experts expresses much satisfaction at the behaviour of the terracotta filling actually used, while a second set finds that the terracotta did not do what was required of it, and regrets that more stiffness was not given to the structures by the use of some form of concrete filling.

In connection with the Hygienic Congress at the Brussels Exhibition, the Sanitary Inspectors' Association have arranged to visit Belgium early in September. M. Buis, the Burgomaster of Brussels, has invited the members to a reception at the Hôtel de Ville on the evening of September 6, and has also placed the Militia Hall at their disposal for their meetings.

Through the efforts of the fire-engineers, a clause has been introduced into the new building ordinance of St. Louis, providing that no mercantile building shall have a greater unbroken area in any story than 7,500sq.ft. Complaint is made in the local journals that the restriction "hinders the growth of business-houses," and it is proposed to amend it by providing, in place of the limitation of the area, that spaces more than 7,500sq.ft. in extent must be equipped with automatic sprinklers, and that elevator-shafts must be of fireproof material.

At a meeting of the sewerage committee of Aberdeen Town Council on Tuesday, a tender was accepted for the construction of an outfall sewer from Palmerston-road to near Victoria Bridge. The successful contractor is Mr. George Pirie, and the cost of the work will be £8,072.

At the Leeds Assizes on Friday, before Mr. Justice Grantham and a jury, Tom Crowther, farmer, Darton, near Barnsley, recovered £120 damages for assault from George Taylor, builder and contractor, of Mappewell. During an altercation after a sale defendant threatened to knock plaintiff's eye out. This was followed up by a violent blow on the right eye, which was burst and had to be removed afterwards.

At South Shield on Wednesday week, the foundation-stone of a new Unionist club was laid. The building will be four stories in height, with a frontage to Catherine-street of 40ft., and a depth of 55ft., and the main façade will be of red brick with terracotta dressings. Mr. J. H. Morton, F.R.I.B.A., is the architect, and Mr. W. J. Robertson, also of South Shields, the contractor.

The Bishop of London consecrated the new church of St. Peter, Lower Edmonton yesterday (Thursday). The church is to be the parish church of a new district as soon as an endowment has been found. The cost of the building has been £3,800, but towards this sum only £2,400 has been raised.

Mr. E. J. Purnell, formerly city surveyor of Coventry, and now waterworks engineer, has been presented by the employés of his former department with an illuminated address, a cigar-case, match-box, and snuffbox of considerable value. There were eighty signatures to the address.

Three stained-glass windows in memory of the late Lord Lilford were unveiled on Thursday afternoon in the church of Thorp Achurch, Northamptonshire, by the Dean of Peterborough.

The City Corporation have agreed, on the recommendation of the cattle market's committee, to spend £9,000 for providing additional lirage accommodation at the Foreign Cattle Market at Deptford.

The will of the late Mr. George Gilbert Scott, M.A., F.S.A., the well-known architect, described as of the Midland Hotel, St. Pancras, has been proved, the value of the personal estate being £41,710.

The will of Mr. David Kirkaldy, of the well-known testing works for building materials at 99, Southwark-street, and 45, Carleton-road, Tufnell-park, engineer, who died on January 25, was proved on July 23 by Mr. William George Kirkaldy, the son, and Miss Isabella Miller Kirkaldy, the daughter, the executors, the value of the personal estate being £8,453 8s. 3d. Subject to a few legacies to servants, clerks, and workpeople, he leaves all his property to his said son and daughter.

The work was commenced at Darfield parish church on Friday by Mr. Kent, of Sheffield, of taking out the choir-stalls and clergy-pews, laying a marble floor in the chancel, and erecting a carved oak screen. The latter is the work of a number of ladies and gentlemen in the parish, who have worked for the last two years, under the supervision of Mr. Kent. The work will take about six weeks to complete. The bells are also to be rehung and the tower pointed. Mr. J. D. Webster, of Sheffield, is the architect.

Next session is the Jubilee of the Liverpool Architectural Society. The council of the society propose to establish a travelling studentship to be awarded at the end of each session.

On Wednesday week the foundation-stone of the new parish church of St. David's, at Exeter, was laid. The church, when completed, will seat about 850, and will have a massive square tower of 100ft. in height. The style of architecture is of the Transitional period, from the Decorated to the Perpendicular, in the 14th and 15th centuries. Mr. W. D. Caroe, M.A., is the architect, Mr. W. Dart, of Crediton, the contractor, and Mr. F. Powell the clerk of works.

A special meeting of the Tyne Improvement Commissioners was held on Friday for the purpose of receiving a report from the committee appointed to consider and define the duties, qualifications, and salary of an engineer, in succession to the late Mr. Messent. Applications, with recent testimonials, will be received up to Sept. 1. The engineer will be responsible for the designing and the execution of all the engineering works of the commissioners; will be required to devote himself exclusively to the service of the commissioners, and to reside in the district. The salary will be £1,200 per annum.

The West Penwith Rural District Council, at their meeting on Thursday in last week, decided to ask Mr. Maddern, architect, Penzance, to prepare plans, &c., for the new cemetery at St. Erth.

At a meeting of the subscribers to the Wellington College Memorial to Archbishop Benson, held last week, the committee presented their report, which showed that a sum of about £2,000 had been subscribed, and that the governors of the college had offered to add the further sum of £500 to make up the amount estimated to be required to build a new aisle to the school chapel, which is to be carried out in commemoration of the services of Dr. Benson, the first headmaster of Wellington. It was resolved that a further effort be made later to raise funds sufficient to place in the new aisle a statue of Dr. Benson.

At the half-yearly meeting of the City and South London Railway Company the chairman reported that measures were in progress for extending this short line both northwards and southwards. The Finsbury-pavement Station, adjoining the Moor-gate-street Station of the Metropolitan Railway, was proceeding very satisfactorily. The shafts had been sunk, and the tunnels had been started. With regard to the St. Mary Woolnoth Church site, they had deposited the required security and had taken possession. From the outside appearance of the church they supposed it was a substantial building, but they had found it a very poorly-built and flimsy structure, with a good deal of scamped work about it, and they would have to take extreme care to prevent it from falling down. The platform of the St. Mary Woolnoth Station would be connected with the underground platform in the Exchange Station of the Central London Railway. Good progress had been made on the site close to the London-bridge railways in Denman-street; the shafts were down, and the construction of the underground station was now being proceeded with. With respect to the Clapham extension, notices had been served for the sites of the two stations, the one near Clapham-road Stations and the other facing the Common. The company were negotiating for obtaining the buildings on both sites.

AN International Congress of Architects and Retrospective Exhibition of Architecture, organised by the Société Centrale d'Architecture of Belgium, will be held at Brussels from Saturday, August 28, to Thursday, September 2, next. The following are some of the questions to be discussed:—1. Instruction in architectural art: should it be eclectic, or should it be limited to the principles of a school? What should be the programme? 2. Is an architectural diploma necessary? 3. Must one in the restoration of monuments (a) respect or correct mistakes of construction or errors of the ancients; (b) finish the portions of a work they did not finish; (c) suppress parts like construction or furniture for unity of style? 4. What steps should be taken to insure to architects proprietorship of their designs? 5. By what means can a general fund be raised by architects for the protection of their common interests? There will be an exhibition of architectural drawings and models, which will remain open to the 30th September; receptions, excursions to places of interest, and a banquet.

THE annual gathering of the members of the Society of Art Masters for England and Wales took place on Friday at South Kensington Museum. Mr. S. J. Cartledge, the chairman, in his opening address, congratulated the society on its growth during the past twelve months. It was to be deplored that the matter of appointing art masters of experience to inspectorships had made practically no headway with the authorities. It was the duty of the society to persevere in this regard. He regretted that the institution of a degree or diploma for art masters had not advanced further than an expression of willingness by the Science and Art Department to grant a title on the same lines as that granted to the Associates of the Royal College of Science. The council, in their report, stated that, prominent amongst the matters that had engaged their attention was the scheme formulated by the Science and Art Department for substituting attendance grants for grants on examination results. They had informed the authorities that it was their belief that the proposed new alterations would be absolutely pernicious, and respectfully suggesting the desirability of withdrawing them. Mr. Walter Scott, one of the promoters of the society, was elected chairman for the ensuing year, and Mr. Walter Wallis, vice-chairman.

IN a gossiping article on the late Barney Barnato in the current issue of the *Contemporary Review*, Mr. Harry Raymond says that the Chairman of the De Beers Mines "had to the full the old prejudice against house-building, and if he indeed had any superstition, it was in this. He yet made many announcements of building of palaces from motives of policy. At Johannesburg many plans were prepared and sites selected, but it was only within the last two years that work was really commenced in laying out thirteen acres of gardens. Even this was solely for the purpose of booming the villa lots he owned in the vicinity. When he was in Johannesburg a little more than a year ago, I showed him a print of the elevation of his Park-lane house, which had been issued with, I think, the *BUILDING NEWS*. [Yes, the perspective and plan appeared as a double-page illustration in the *BUILDING NEWS* for May 8, 1896.—ED.] "I shall have the finest entrance-hall, stairs, and dining-room in London," he said. "So you are really building at last?" "Building?" he queried, sharply. "Oh, yes, I am building—I must."

THE council of the Whitworth Institute, at Manchester, in their third annual report, just published, state that during the year two new galleries, known as the north and the central, have been completed, and that in the same period the council received gifts of the following oil-paintings:—"Interior of the Prison of Chillon," an early work by Clarkson Stanfield, R.A.; "Temple of Jupiter," by J. M. W. Turner, R.A.; "Springtime" and "Autumn Sunset," by J. T. Linnell; and "View of Rome from the Barbarini Gardens," by David Roberts, R.A.; "Cittara, Gulf of Salerno," and "Oude Scheld, Texel Island," by Clarkson Stanfield, R.A.; and "The Emigrants" and "A Roadside Nibble," by John Linnell. Professor Flinders Petrie has presented a fine series of old Egyptian textiles (about 600 A.D.) in 52 small cases. The collection of coins

has been augmented by a series given by Mr. T. P. Hall. The library has also received some interesting and valuable additions. The council having received a further donation of about £27,000 in shares from the Whitworth bequest, they decided upon proceeding with the erection of a third gallery, corresponding in position and dimensions with the north gallery, and, like it, accessible from the central gallery, with an extension of the temporary corridor alongside of the old house. As this new gallery will front on to the park, it is proposed to construct, with material removed from the new foundations, a terrace, which will at once add dignity to the edifice, and provide a promenade walk overlooking the park towards the south. The erection of the new buildings will be carried out, as have been the present galleries, under the direction of Mr. J. W. Beaumont, of Manchester, by Messrs. Neill and Sons, of the same city, at a cost of about £7,000.

AT the National Eisteddfod, which is being held this year at Newport, Mon., the prizes in the architectural competitions were awarded by Mr. Beresford Pite, F.R.I.B.A., the ex-president of the London Architectural Association. A prize of £10 and a silver medal had been offered for the best design for a national museum and art gallery for Wales, the cost not to exceed £20,000. The subject, Mr. Pite remarked, in making the adjudication, was an exceedingly difficult one, for the reason that to ask for a national museum and art gallery for Wales and to limit the cost to a paltry £20,000 was a contradiction in terms, and it had hampered the competitors very seriously. The result was that one competitor had designed a national building, and had left out the museum and art gallery, while other competitors had designed a museum and art gallery, without having any national aspiration about them at all. The prize was awarded to the design sent in by "Red Dragon" (Mr. John Bain, Newport, Mon.) In the competition for designs for a hall fireplace, Mr. Pite awarded a £5 prize to the work sent in by "Ingle," whose proper name was not disclosed; while the work of Mr. T. P. Burrows, of Caerphilly, was commended. For the best drawing from actual machinery, the winner was Mr. W. C. Davies, of Aberystwyth. All the adjudicators spoke in commendation of the drawings sent in by Mr. W. E. Mathews, of Newport.

THE Treasury have appointed a committee of nine members, including Lord Rayleigh, Sir J. Wolfe Barry, and Mr. W. C. Roberts-Austen, to consider and report upon the desirability of establishing a National Physical laboratory for the testing and verification of instruments for physical investigation, for the construction and preservation of standards of measurement, and for the systematic determination of physical constants and numerical data useful for scientific and industrial purposes, and to report whether the work of such an institution, if established, could be associated with any testing or standardising work already performed, wholly or partly at the public cost.

AMONG the subjects selected for discussion at the 16th annual congress of the Sanitary Institute to be held at Leeds from the 14th to the 18th September are:—Disinfection of rooms; sanitary law; suggestions for codification and amendment; collection of refuse: its destruction or utilisation; the disposal of slops and excreta in rural districts; the scientific bases of sewage disposal; water supply for rural districts, and the means of protecting it from contamination; purification of trade effluents, and utilisation of factory waste products; the Acts of Parliament in reference to the pollution of rivers; sanitary aspect of wood paving; the abatement of smoke; geological stratification and disease; and geology in reference to water-bearing strata. The proceedings will be conducted in three sections, to be held in the Town Hall and adjoining rooms, viz.: I., Sanitary Science and Preventive Medicine; II., Engineering and Architecture; and III., Chemistry, Meteorology, and Geology.

IN the tower of Grace Chapel, New York, electricity has replaced the weights of the tower clock, and not only turns its wheels, but also strikes the quarters and the hours and plays a curfew hymn at the close of the day. The weights by which the tower clock and chimes were actuated have been replaced by a small electric motor. The current is furnished from a storage battery which is charged by the Grace Chapel dynamo, and has sufficient capacity to run the clock for two weeks in case it should be neces-

sary to shut down the dynamo. The motor shaft carries a small grooved pulley from which a coiled wire belt runs to a friction pulley on the arbour or shaft of the escapement gear, which is thus subjected to a steady pull, answering to the pull of the weights in an ordinary clock. Every movement of the escapement allows the shaft to rotate the required amount, and the resulting movements of the clock are transmitted by light hollow shafting to the tower clock dials. The chime consists of ten Meneely bells, the largest of which weighs about 3,000lb. and the smallest 250lb. The cost of the current for running the motor is estimated at 1½ cents per day, and the clock has proved to be a reliable timekeeper. The electrical action has been carried out under the supervision of Mr. George F. Atwood, who designed the clock, and Mr. McCullough, the engineer of the Grace Church Settlement plant.

A SHIPMENT of 200,000 bricks was recently made to South Africa, says the *Canadian Architect*, by the Union Brick Works, of Tacoma, W.T. The purchasers were the Lingham Timber and Trading Co., of Delagoa Bay. The price obtained is said to exceed by three or four times the cost of production, hence a handsome profit will be realised. As this is believed to be the beginning of an extensive and profitable foreign trade, the attention of Canadian brick manufacturers, especially those of British Columbia, is directed to the subject. Shipments of Canadian dry pressed bricks have been made to South Africa; but our contemporary has not heard that any ordinary stock bricks have as yet found their way to that country.

AT Hawthornden, Tyndall's Park, on Tuesday week, the members of the reception committee of the recent visit of the National Association of Master Builders of Great Britain to Bristol waited upon Mr. Krauss for the purpose of presenting him with an engraved silver salver. Mr. W. Church, the vice-president, in making the presentation, said he did so with great pleasure, as a slight token of the indefatigable services the president had rendered in connection with the visit of the National Association to Bristol, a most auspicious event in the annals of the local association. Mr. George Humphreys, the treasurer, also bore testimony to the harmonious manner in which Mr. Krauss had worked with the committee. Messrs. C. A. Hayes, G. Wilkins, F. N. Cowlin, and E. Walters, the secretary, also added a few congratulatory remarks, whereupon the president returned thanks for the handsome present. The silver salver bore the following inscription:—"Presented to Augustus Krauss, Esq., president of the Bristol Master Builders' Association, in recognition of the successful meeting in connection with the visit of the National Association of Master Builders of Great Britain, in the Diamond Jubilee year, 1897, by the members of the reception committee.—W. CHURCH (vice-president), G. HUMPHREYS (treasurer), C. A. HAYES, G. WILKINS, E. WALTERS, F. N. COWLIN, H. J. SPEAR (secretary)."

A STATUE of Benjamin Franklin, the first postmaster-general of the United States, is to be placed on the Chestnut-street front of the Philadelphia Post-office. The statue is the work of Mr. John Boyle, the architectural part being by Mr. Frank Miles Day. The site is appropriate, for, according to tradition, it was on the site of the present Post-office that Franklin stood when he brought down lightning from the clouds by means of a kite, and the spot was also formerly occupied by the house built for the official residence of President Washington. The statue shows Franklin seated.

CONSIDERABLE interest is being shown in America in the long-span bridge across the St. Lawrence River at Quebec, the construction of which has for many years been discussed. Since the suggested sites have become better known to engineers by the recent visit of members of the American Society of Civil Engineers to Quebec in attendance upon the last convention, two of the leading plans have been distributed for re-examination. One of them, by E. S. Shaw, C.E., Boston, is designed to span the river a few miles above Quebec, and is a thorough cantilever, 3,360ft. in extreme length, with a 1,440ft. centre span and two 560ft. side spans, all of cantilever construction. The roadway is 153ft. above high tide, the towers 310ft. above the piers, and the suspended centre span 430ft. long and 80ft. high. There are two railway tracks and two carriage ways in the same plane, with a total width of

58ft., and the estimated cost is from three to three and one-half million dollars. The other project, by Mr. C. Baillargé, city engineer of Quebec, and essentially the same as proposed by him forty years ago, is for a structure from directly opposite the Chateau Frontenac to Point Lévis, and consists of a superstructure 4,800ft. long, suspended from continuous cables in three 1,200ft. intermediate and two 600ft. end spans. The two middle piers are to be built in pneumatic caissons surrounded by large protective cribwork. The railroads, street-cars, carriage ways, and promenades will occupy two decks, and although Mr. Baillargé states that he cannot exceed the 18 hours a day that he now works to undertake the construction of the bridge, he believes that it can be built for not more than £2,000,000 more than the other design.

M. A. F. GALL, in *La Nature*, says that up to the present time the method employed for staining glass consists in adding a metallic oxide to the glass, and melting together the whole mass. M. Gall colours his glass on the surface without melting; he simply impregnates the glass with the colouring, and then applies to a piece of glass some silver salt, placing it in a furnace at a temperature of from 500° to 550°. After a time, when it is cooled down and the free surface salt removed, the glass will be found stained yellow. According to the composition of the glass the stain may vary from pale yellow through orange to red. A very slight quantity of silver salt only is needed. A piece of lace dipped into a one-tenth purest solution of nitrate of silver, and afterwards into one of sulphide of potassium, placed on a piece of glass and heated, leaves an imprint of deep yellow. The intensity of colour is dependent upon the strength of the silver salt applied, and the depth of penetration upon the time of "cooking."

The Architectural Club of Boston, Mass., has sent abroad a young architect for three months of study, and the event has attracted attention by reason of the novelty of the means whereby the scholarship was awarded. Instead of holding examinations and awarding the scholarship or fund to the man who should get the highest percentage, it was decided, the *Engineering Record* explains, to select a young member whose work in the club classes showed promise, and whose application and ambition were of a kind to attract the attention of the older members, and vote him the sum of 200dol. without any examinations, and with simply the stipulation that he devotes himself to a certain line of study while abroad, which is outlined by the club, and shows the results of his work on his return.

COMPLAINTS have been made by the Manchester and Salford Sanitary Association as to the growing practice of mixing water-gas with coal-gas on account of the large quantity of carbon monoxide (a positive and very subtle poison) which is contained in the water-gas and even in the water-oil-gas. Very serious results have followed the employment of water-gas for illuminating purposes in America, notably in Boston, Mass., and the gas committee of municipalities undertaking the supply of gas have a great responsibility, especially if they are obliged to use water-gas because they cannot otherwise keep up the supply.

The London County Council have purchased Fortune Green, West Hampstead, which is to be used as a recreation-ground, for £8,000. The green comprises about three acres to be maintained as an open space by the Hampstead Vestry, which has agreed to contribute £3,000 towards the purchase, a similar sum having been given by the Council, and the remainder raised by subscription.

Mr. Arnold Boyle, C.B., one of the inspectors appointed by the medical department of the Local Government Board, held an inquiry at the offices of the urban district council, Sevenoaks, on the 26th ult., with reference to the proposed purchase of a site at Roundabout Wood for the erection of an infectious hospital for the district.

New board schools at Weston-super-Mare were formally opened by Lady Kekewich on Friday. Messrs. Hans F. Price and Woolcott, of Weston, were the architects. Mr. C. Addiscott, was the contractor, and Mr. T. W. A. Hayward, the clerk of works.

The foundation-stone of the science and art buildings, which are being added to the Grammar School at Morpeth, was laid on Friday. The buildings are being erected by Mr. T. W. Middlemiss, from designs by Messrs. Boulds and Hardy, architects, of Morpeth.

Trade News.

WAGES MOVEMENTS.

EDINBURGH.—All the operative masons in Edinburgh and Leith, with the exception of those employed in three or four small yards, came out on strike on Monday for an eight hours' day. With the exception of the smaller yards, the masters were unanimous in refusing the demands. Over 2,000 men are out.

ROCHDALE.—The local branch of the Society of Operative Plasterers have asked the employers for an advance of one penny per hour in their wages and a decrease of one hour per day in their working hours. The plasterers' labourers have asked for an advance of a halfpenny per hour, and the same reduction in their hours of work. If this is refused, the men will come out on strike. The present wages are: plasterers, 8½d., and labourers 6d., per hour.

SCARBOROUGH.—The bricklayers of this town have gone on strike for 9d. an hour. They have refused to compromise the matter by accepting 8½d., the same terms as those upon which a dispute with the plasterers was settled last week.

CHIPS.

Mr. Florian B. Dicharry, who died in St. James, La., last month, was an architect who had built several churches and convents in Louisiana.

The Holden wing of the Rochdale Infirmary, opened last week, has been built by Messrs. J. and J. Coates, of that town, from plans by Messrs. Butterworth and Duncan, architects, of South-parade, Rochdale.

At Chester Consistory Court on Friday the vicar and the wardens of St. Mark's, Dukinfield, obtained permission to form a baptistery in the north-west angle of the church, to remove the font thereto, to insert two windows in the west wall, and to place stained-glass windows in the south aisle of the church as a memorial. The incumbent of St. Augustine's, Brinksway, obtained permission to place stained glass in the east window of the morning chapel as a memorial.

An inquiry was held at Okehampton on Wednesday week by Mr. W. W. Tuckett, Local Government Board Inspector, with reference to the application of the town council for leave to borrow £935 for street improvements and sewage purposes, and £140 for fire-brigade purposes. The borough surveyor explained the proposals.

Herr Johann Trenwald, the historic painter and a professor in the Vienna Academy of Fine Arts, died on Wednesday in last week near Vienna, aged 73. Besides many historical pictures, he painted a considerable number of church frescoes and other religious pictures.

A peal of six bells, cast by Mr. James Barwell, of Birmingham, has just been placed in the tower of Knowle Church, to commemorate the Queen's record reign. The dedication service takes place to-morrow (Saturday).

Princess Henry of Battenberg, on Saturday, laid the foundation-stone of the eleventh block of the Ventnor Royal National Hospital for Consumption. The new block, which is being erected in memory of the late Prince Henry of Battenberg, will consist of three houses, accommodating 21 patients, and in addition there will be the usual apartments for the staff. The contract price for the block is £9,134. A guard of honour was provided by a detachment of the 5th Isle of Wight (Princess Beatrice's) Volunteers, under the command of Major Theodore R. Saunders, who is architect of the new building.

The arbitration to settle the price to be paid by the Ashford (East Kent) Urban District Council for the purchase of the local gas undertaking from the Ashford Gas and Coke Company, Ltd., was commenced on Monday, July 26, the arbitrator being Mr. J. Shiress Will, Q.C. The proceedings took place at the temporary premises of the Surveyors' Institution, Savoy-street, Strand. The arbitrator's award has just been made known, the total sum being fixed at 24 years' purchase on a profit of £1,420 per annum, in all £34,080, besides £2,400 for fixtures.

The members of the Southampton and District Builders' and Decorators' Association held their second annual outing on Wednesday week, when Marlborough was visited. At the dinner, held in the evening, the president, Major Brinton, of the firm of Brinton and Bone, presided, and was supported by Mr. Doggrell, hon. secretary, and a large number of members.

The foundation-stone of new buildings, being a considerable enlargement of St. Anne's Schools, Bishop Auckland, was laid yesterday. Messrs. Clarke and Moscrop, Darlington, are the architects, and the estimated cost is £2,000.

Croft, Carmarthen—Farmhouse		J. P. M. George, Rhydgarnwen	7
Llandaff—Stabling and Greenhouse at Netherwood	C. J. Smart	John W. Rodger, Architect, 14, High-street, Cardiff	7
Llanyspyddid—Additions and Alterations at Board School	U.D. School Board	W. Williams, Clerk, Glanrhyd, near Brecon	9
Great Horton, Bradford—Four Terrace Houses	School Board	Samuel Robinson, Architect and Surveyor, Cheapside, Bradford	9
Kinson—Infants' School		H. W. Dibben, Clerk, Matlock House, Upper Parkstone	9
Middlesbrough—Additions to Seamen's Mission	Corporation	J. M. Bottomley, Architect, 28, Albert-road, Middlesbrough	9
Glasgow—Three Tenements, Sobcross-street		J. D. Marwick, Town Clerk, City Chambers, Glasgow	9
Auchindochy—Distillery at Towmore	Guardians of Cavan Union	John Alcock, Architect, Keith	9
Cavan—Labourers' Cottages in Various Electoral Divisions	Sussex Portland Cement Co.	Joseph D. Grier, Clerk, Cavan	9
Heighton, Newhaven—Chimney, 130ft. high		The Manager, Newhaven	9
Chester—Infectious Diseases Hospital, Sealand-road	Ralf Dowdeswell	Saml. Smith, Town Clerk, Town Hall, Chester	9
Aberhan, Merthyr Vale—Two Cottages	Parks Committee	William Dowdeswell, Architect, Treharris	9
Eccles—Pavilion, Recreation Ground		G. W. Bailey, Town Clerk, Town Hall, Eccles	9
Croxdale—Wesleyan Church		J. B. Foster, Station-terrace, Croxdale	9
Bridlington Quay—9, 13, 17, 21, or 25 Houses north side of Richmond-street	W. Battle	J. Earnshaw, M.S.A., Architect, Wellington-rd., Bridlington Quay	10
Millbay, Plymouth—Enlargement, Passenger Station	Great Western Railway Co.	G. K. Mills, Secretary, Paddington Station	10
Dover—Alterations, Workhouse Hospital	Board of Guardians	Eugene Carder, Clerk, 17, Market-square, Dover	10
Galway—Alterations to County Court House	Corporation	Jas. Perry, M.E., County Surveyor, Galway	10
Boston—Additions to Farmhouse		R. W. Staniland, Town Clerk, Boston	10
Lexden—Alterations, Workhouse	Guardians of Lexden & Winstree U.	Chas. H. Thompson, Clerk, Victoria Chambers, Colchester	10
Highgate Hill—Infirmary (800 beds)	Islington Board of Guardians	E. Davey, Clerk, St. John's-road, Upper Holloway	10
Southend-on-Sea—Primitive Methodist Chapel and Schools, Pleasant-road		Rev. T. Jackson, 8, Rushmore-road, Clapton, N.	10
Cardiff—Alterations to 16, George-street, Docks, Cardiff	William Jones	W. H. Dashwood Caple, Architect, 1, St. John's-square, Cardiff	11
Quaker's Yard—Twenty Cottages	Woodland Building Society	Wm. Dowdeswell, Architect, Treharris	11
Cardiff—Converting 46, Cowbridge-road, into Business Premises	Col. Surtees	W. H. Dashwood Caple, 1, St. John's-square, Cardiff	11
Ferryhill—Repairing Four Farmsteads	Jas. Tidman	F. A. Livesey, Architect, Market-place, Bishop Auckland	11
Gorleston—Six Cottages, Church-road	Provident Industrial Society	W. B. Cockrill, Architect, Gorleston, Yarmouth	11
Bradford—Alterations to Premises in Bridge-st. and Vicar-lane		Secretary, 65, Sunbridge-road, Bradford	12
Gawthorpe, near Ossett—Church	Board of Guardians	Tom H. Farrar, Architect, Fountain-street, Halifax	12
Runcorn—Enlargement of Board-room	Representatives of late H. A. Gillett	John Ashton, Clerk, Runcorn	12
High Ham—Villa	Guardians of Lurgan Union	Jos. Spire, Architect, Glastonbury	12
Aghalee—Dispensary at Folly Hill	Lords of Admiralty	Edwin Jas. Donaldson, Clerk, Lurgan	12
Scarborough—Eight Coastguard Houses		Director of Works Department, 21, Craven-street, W.C.	13
Falmouth—Reseating Wesleyan Chapel	Illogan School Board	H. W. Collins, Architect, Penryn-street, Redruth	13
Clones—Upper Part of Tower and Spire at the Catholic Church		Very Rev. L. J. Canon O'Neill, P.P., Clones	14
Carnkie—New School	Great Northern Ry. Co. (Ireland)	F. W. Blamey, Clerk, Portreath	14
Carlisle—House and Cottage at Curthwaite Mill	Guardians	George Armstrong, Architect, 45, Lowther-street, Carlisle	14
Ballyhaise—Two One-Story Cottages	Urban District Council	T. Morrison, Secretary, Amiens-street, Terminus, Dublin	16
Pontypool—Alterations & Additions to Workhouse, Griffithstown Carly—Additions and Alterations to Lunatic Asylum	Liverpool Corporation	T. H. Atkins, Clerk, Club Chambers, Pontypool	18
Sunbury-on-Thames—Engine House		Secretary, Board of Control, Custom House, Dublin	20
Trimdon Grange—Enlarging and Reseating Wesleyan Chapel		John Austin, C.E., Engineer, 17, Victoria-street, Westminster	23
Everton—Chimney Shaft, Refuse Destructor, Cobb's Quarry		W. R. Woodhead, Trimdon Grange, Co. Durham	24
Pare Gwyllt Asylum—Temporary Block		Town Clerk, Municipal Buildings, Liverpool	24
Dinas Powis—Truant Industrial School		T. T. Lewis, Solicitor, Bridgend	25
Dewsbury—28 Houses, Hill Head, Malkroyd-lane	Cardiff and Barry School Boards	John J. Jackson, Clerk, School Board Offices, Howard-gdns., Cardiff	23
Reading—Repairs to Four Houses	Pioneers' Industrial Society, Ltd.	Holtom and Fox, Architects, Westgate, Dewsbury	30
Briton Ferry—House	Griffiths Building Club, Cwmillery	Heron and Heron, Auctioneers, 135, Victoria-st., Westminster, S.W.	—
Mount Pleasant, Mon.—Eight Workmen's Cottages		J. C. Rees, Architect, St. Thomas's Chambers, Neath	—
New Wortley—Four Houses		Lansdowne & Griggs, Archts., Metropolt Bank Chmbrs, Newport, Mn.	—
Catford—Three Terrace Houses, Two Shops, and Stable, Brad- gate and Silvermere-roads		Crown Hotel, New Wortley	—
Woking—Conservative Club, Commercial-road		Phillips and Norfolk, Architects, Catford Bridge, S.E.	—
Harrigate—Stables at the Victoria Hotel	Bentley and E.C.	F. W. Austin, Secretary, 20, Cheapside, E.C.	—
Killamarsh—Six Houses		Albert E. Kirk, A.R.I.B.A., 13, Bond-street, Leeds, architect	—
Clacton-on-Sea—Shops, Residences, and Stables, Wellesley and Carnarvon roads	Ocean Steam Fishing Co., Ltd.	W. H. Wagstaff, Architect, Chesterfield	—
Catford—Eight Terrace Houses, Beechfield-road		J. W. Martin, Architect, Station Chambers, Clacton-on-Sea	—
Grimsby—Store, Fish Dock		Phillips and Norfolk, Architects, Catford Bridge, S.E.	—
Shaw—Congregational Schools, Rochdale-road		E. De Lacey Read, Secretary, Fish Docks, Grimsby	—
		W. Dixon, Architect, Trevelyan Building, Manchester	—

BUILDINGS—continued.

Castleton—Wesleyan Chapel	T. Dobson and Sons	H. W. Lockwood, Architect, Palatine Chmbrs, Pinstone-st., Sheffield
Arnside—Two Villas	J. M'Clafferty	Jno. Stalker, M.S.A., 57, Highgate, Kendal
Hyde—Alterations, St. Paul's R.C. Schools	S. Whitaker	E. Kirby, 5, Cook-street, Liverpool
Bradford—12 Houses, Barker-end-road	Working Men's Co-operative Society	G. C. Gamble, Architect, Parkinson's Chambers, Bradford
Dundrum—Premises and Residence	Guardians of St. Pancras	J. J. M'Donnell, Architect, 27, Chichester-street, Belfast
Atercliffe—Four Houses at Broadbaks	Leeds School Board	Walker Bros., Architects, 76, Carver-street, Sheffield
Newlay, Leeds—Alterations to Houses	Lighting Committee	J. Peakman, Architect, Hopwood Bank, Horsforth, Leeds
Leeds—Eight Houses & Two Shops, Upper Accommodation-rd.	Tottenham School Board	J. R. Conyers, 159, East-street, Leeds
Kirkby-in-Ashfield—Stores	Dr. O'Keeffe	Ball and Lamb, Architects, 5, Hounds-gate, Nottingham
Killmarsh—Six Houses	Bentley and Co.	Wm. Hy. Wagstaff, Architect, Chesterfield
Leavesden—Alterations to St. Pancras Schools	Ernest T. Hooley	C. P. Ayres, Architect, 14, High-street, Watford
Gateshead—Fourteen Small Self-Contained Houses	Building Committee	J. Morris, Millicent-terrace, Gateshead
Leeds—Infants' School at Hunslet Carr	Benskin's Watford Brewery, Ltd.	W. Packer, Clerk, School Board Offices, Leeds
Marylebone—Rebuilding No. 90, High-street	Edmund Toms	J. Randall, Vining, 89, Chancery-lane, W.C.
Kingston-upon-Thames—Electric Light Works Extension	Gwalia Hotel Co., Ltd.	Harold A. Winsor, Town Clerk, Catern House, Kingston-on-Th.
Mumbles, Swansea—Rebuilding the Mermaid Hotel	J. Beer	H. Tudor Thornley, Architect, 100, St. Mary-street, Cardiff
Wood Green, N.—Higher-grade Schools	School Board	A. M. Butler, Architect, 16, Finsbury-circus, E.C.
Leeds—Workshop	Guardians of Lurgan Union	J. C. Warriner, Carlton Hill, Leeds
Griffithstown, Mon.—House and Stables	John H. Shepherd	Lansdowne & Griggs, Archts., Metrop. Bank Chmbrs., Newport, Mon.
Belfast—Repairing Castlereagh Presbyterian Church	City Brewery Co., Exeter	C. A. Aicken, Architect, Rosemary-street, Belfast
Harrogate—Additions and Alterations, Victoria Hotel	W. Goodyear	Albert E. Kirk, A.R.I.B.A., 13, Bond-street, Leeds
Bedlington—House, West-end	J. W. Tirrell	Nicholas Stoker, Shop-row, Bedlington
Draycot—Extension to Victoria Mills	Budden and Biggs' Brewery	G. S. Doughty, Architect, Britannia Chambers, Pelham-st., Notts
Cadoxton Barry—Hotel and Stables, Holton-road	Hornsey Urban District Council	H. Tudor Thornley, Architect, 100, St. Mary-street, Cardiff
Swansea—Additions and Alterations to St. Thomas's Church	Great Western Railway Co.	Wilson and Moxham, Architects, 15, Castle-street, Swansea
Schools	Freebridge-Lynn R. District Council	J. G. Howlett, Cumberland Infirmary, Carlisle
Carlisle—Operating Room at the Cumberland Infirmary	Corporation	J. H. Burton, Architect, 2, Guide-lane, Hooley Hill
Audenshaw—Classroom, St. Stephen's Schools	Town Council	Dear and Winder, Archts., 119, Great Russell-st., Bloomsbury, W.C.
London, E.C.—Rebuilding Rose and Crown, Bartholomew-close	Corporation	Isitt, Adkin, and Hill, Architects, Prudential Buildings, Bradford
Baildon—House	Mayor, &c.	James Ruddle, Architect, Boroughbury, Peterborough
Peterborough—Pair of Villas in Fletton-avenue	Minister of Public Works	Anglo-Continental Guano Works, 15, Leadenhall-street, E.C.
Tidal Basin, E.—Alterations & Timber-work at Manure Factory	Colonel Wheelley	Fred. Mitchell, Architect, 71, Albion-street, Leeds
Rawdon, Leeds—Four Terrace Houses, Apperley-lane	Rural District Council	Swash and Bain, Architects, Midland Bank Chambers, Newport
Llandrindod Wells—Hotel	Thames Conservators	G. Silvester, Surveyor, 46, Strand, W.C.
London, E.C.—Alterations to The Three Tuns, Fann-street	Yorkshire Bacon-Curing Co.	W. T. Rhoden, Archt., Buckingham Chmbrs., St. James's-st., Sheffield
Barbican		E. F. Bishopp, Architect, 32, Museum-street, Ipswich
Gleedless—Alterations to Heeley and Sheffield House		K. D. Roche, Architect, Marlborough-street, Cork
Ipswich—Additions Rose Hill Schools		Edwin Jas. Donaldson, Clerk, Lurgan
Cork—Alterations, 6, North-mall		T. R. Baker, Bark Hill, Bewdley
Aghalee—Dispensary, Folly Hill		J. H. Greaves and Co., Architects, Corn Market, Pontefract
Bewdley—House and Farm Buildings		C. P. Ayres, Architect, 14, High-street, Watford
Ferrybridge—Villa		Kerby and Ellis, Architects, Exmouth
Barnet—Additions to Victoria College Hospital		Isitt, Adkin, and Hill, Prudential Buildings, Bradford
Exmouth—Railway Hotel		Arthur A. Gibson, Architect, 8, Cambridge-crescent, Harrogate
Baildon—Residence		E. Isle Hubbard, M.S.A., Moorgate-street, Rotherham
Knarborough—Detached House, Boroughbridge-road		Silecock and Reay, Architects, College Chambers, Bath
Swinton—Rebuilding Parish Church		Hy. Bispham, Newton-in-Cartmel
Twerton, Bath—Schools		J. S. Stallebrass, Architect, Peterborough
Newton-in-Cartmel—House		J. H. Burton, Architect, 2, Guide-lane, Hooley Hill
Peterborough—House and Shop, Buckle-street		—, Boucher, Architect, High-street, Rochester
Dukinfield—Alterations, Victoria British Schools		George Armstrong, Architect, 45, Lowther-street, Carlisle
Chatham—Rebuilding Alexandra Inn		
Carlisle—Alterations to Golden Fleece Inn		

ENGINEERING.

Highgate—Culvert, Cholmeley Park Estate	F. D. Askey, Clerk, Southwood-lane, Highgate	Aug. 9
Stonehouse, Glos.—Footbridge over Line	G. K. Mills, Secretary, Paddington Station, W.	" 10
Castleacre—Bridge over the River Nar	James S. Culham, Highway Surveyor, Grimsby, King's Lynn	" 11
Morecambe—Widening East End Pier	Magnall & Littlewoods, Architects, 42, Spring-gardens, Manchester	" 12
Tonbridge—Carburettor Plant	James Donaldson, Secretary, Tonbridge	" 12
Carlisle—Electric Lighting Plant	Henry C. Marks, City Surveyor, Fisher-street, Carlisle	" 12
Deerhurst—Repairing the Gildable Flood-Gate	S. J. Gillett, Surveyor, Deerhurst	" 14
Brighton—Condensing Plant	Francis J. Tillstone, Town Clerk, Town Hall, Brighton	" 16
Salford—Electric Wiring Library and Museum at Peel Park	Town Clerk, Town Hall, Salford	" 17
Inverness—Waterworks, and Laying about 5,300 yards of Pipes	Kenneth Macdonald, Town Clerk, Inverness	" 17
Craiova—Water Supply	The Mairie, Craiova, Roumania	" 28
Cairo—Iron Bridge (Second Time)	Public Works Department, Cairo	" 31
Aberdare—Sinking Shaft at Cwmaman Colliery	W. J. Heppell, Cwmaman Colliery, Aberdare	
Pontypool—Culvert, Manholes, &c.	Lansdowne & Griggs, Archts., Metropolitan Bank Chmbrs, Newport	
Newark—Bridge Works	Tom Vickers, C.E., District Surveyor, Newark	
Ashby-de-la-Zouch—Sinking Well	Sutton and Co., Union Pottery, Overseal, Ashby-de-la-Zouch	
London—Two Steam Hoppers	Engineer, Thames Conservancy, Victoria Embankment, E.C.	
Selby—Sinking Artesian Well	E. Townsend, Secretary, 1, Abbey-place, Selby	
Dublin—Heating Training College, Marlborough-street	The Principals, Marlborough-street Training College, Dublin	

FENCING AND WALLS.

Lesbury—W.I. Flat Bar Fencing	Alnwick Rural District Council	H. W. Walton, Clerk, Alnwick	Aug. 9
Cavan—Inclosing Sites of Labourers' Cottages	Board of Guardians	J. D. Grier, Clerk, Cavan	" 9
Mountain Ash—Rubble Ash Wall	Urban District Council	H. P. Linton, Clerk, Town Hall, Mountain Ash	" 9
Stoke-next-Guildford—Oak Fence (170ft. by 6ft.) at Stoughton Recreation Ground	Parish Council	Peter Dewar, Clerk, 35, Artillery-road, Stoke, Guildford	" 14
Mallaig, N.B.—Wire Fencing on Mallaig Section	West Highland Railway Co.	R. MacAlpine and Sons, 33, Gordon-street, Glasgow	" 1
Sedgefield—Concrete Retaining Walls	Asylum Committee	W. Crozier, County Surveyor, Darham	" 1

FURNITURE AND FITTINGS.

Crewe—Furniture, Bedding, Carpets, &c., for Fever Hospital	Corporation	F. Cook, Town Clerk, Crewe	Aug. 7
Cuddington—Furnishing Fever Hospital	Joint Hospital Board	W. O. Reader, Clerk, Lonsdale, Epsom	" 9
Handsworth—Furniture and Fittings, Technical School	Committee	H. Ward, Hon. Secretary, Council House, Soho-road, Handsworth	" 9
Merthyr Tydfil—Furniture for New Public Offices	Urban District Council	Gwilym C. James, Clerk, 58, Thomas-street, Merthyr Tydfil	" 17
Hulme—Electric Light Fittings, Town Hall	Committee	J. Rison, Town Hall, Manchester	" 17

PAINTING.

Greenock—Smithston Lodge	Boston, Menzies, and Horton, Architects, 11, Willis-st., Greenock	Aug. 7
Hull—Properties	E. G. Smith, Secretary, Hull	" 7
Keighley—Dalton and Cornhill Bridges	W. H. Hopkinson, Borough Engineer, Keighley	" 9
Kinson, Dorset—Heatherlands Board School	H. W. Dibben, Clerk, Kinson	" 9
Handsworth—Council House	H. Ward, Clerk, Soho-road, Birmingham	" 9
Tamworth—Fever Hospital	H. J. Clarkson, 22, Church-street, Tamworth	" 14
Canterbury—Workhouse and Infirmary	J. Plummer, Clerk, 38, St. Margaret-street, Canterbury	" 16
Hulme, Manchester—Town Hall	J. Rison, Town Hall, Manchester	" 16
Morley—Public Market, Morley	W. H. Jowett, Cragg Vale House, Morley	" 16
Gretland—Cottages at Crosshill	Joseph Peel, Mount Pleasant, Gretland	" 16
Audenshaw—St. Stephen's Central and Branch Schools	Rev. A. C. Bulkeley, Audenshaw Vicarage, Manchester	" 16

ROADS AND STREETS.

Eccles—Sewering and Paving Vernon-avenue	Highways Committee	Geo. Wm. Bailey, Town Clerk, Town Hall, Eccles	Aug. 9
Sandal Magna—Kerbing and Concrete Flagging Doncaster-road	Urban District Council	Arthur Fawcett, A.M.I.C.E., Old Town Hall, Wakefield	" 9
Brighouse—Kerbing, &c., Rastrick Common	Highways Committee	Emerson Brooke, Borough Surveyor, Public Offices, Brighouse	" 9
Batley—Making-up Orford-street and Great Wood-street	Corporation	J. H. Craib, Town Clerk, Batley	" 9
Woolwich—Granite Paving and Jarrahdale Paving	Local Board	H. O. Thomas, A.M.I.C.E., Town Hall, Woolwich	" 10
Walsend—Street Works	Urban District Council	W. S. Daglish, Clerk, 28, Sandhill, Newcastle-on-Tyne	" 11
Spennymoor—Footpaths	Urban District Council	F. Badoock, Clerk, 3, James-street, Spennymoor	" 11
Pontliff—Laying Out Roads, Pontliff Estate	Burial Board	Gustard & Waddington, Solicitors, 13, Gloucester Bk-chmbrs, Nwprt	" 11
Aldbrough, Yorks—Asphalte Paths at Cemetery	Highways Committee	F. S. Capes, Clerk, Boroughbridge	" 12
Halifax—Making Up Four Streets	Corporation	Edward R. S. Escott, Borough Engineer, Town Hall, Halifax	" 12
Morley—Paving and Channelling, Dartmouth-avenue	Corporation	M. H. Sykes, Borough Surveyor, Town Hall, Morley	" 16
Morley—Sewering and Kerbing, Ashfield-road	Corporation	M. H. Sykes, Borough Surveyor, Town Hall, Morley	" 16
Morley—Sewering and Kerbing, Pawson-street	Corporation	M. H. Sykes, Borough Surveyor, Town Hall, Morley	" 16
Burnley—Paving, &c., 25 Streets and 36 Back Streets	Highways Committee	G. H. Pickles, Borough Surveyor, Town Hall, Burnley	" 18
Birkenhead—Flagging Passages	Corporation	C. Brownridge, Borough Surveyor, Birkenhead	" 18

THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2223.

FRIDAY, AUGUST 13, 1897.

MODERN DISGUISES.

THE word "shams" in connection with architecture came into existence somewhere about the 17th century. Before that time, building and architecture, though not convertible terms, were used as honest interpretations of facts. No one dared to dispute that an architect did anything else than to design according to existing or traditional rules, though, as a matter of fact, ever since the 15th century he had been reverting to bygone modes of building. Still, there was no reproach to his honesty intended: the architect was thought to be in possession of the traditions of his craft, and to build according to them, even although he consulted the works of the early Italian Revivalists in all he did. The word "sham" marked a sense of degeneracy which has not left us. It was applied when we sought to imitate methods of construction, and even materials. All that the architects of the Renaissance did was to imitate style, but they spared no expense in their work. Stone and brick, plaster and wood were employed in their old ways, as all our best English and foreign Renaissance buildings show; but the attempt to produce these in cheaper and inferior materials, like stucco and cement and painted work, led to shams of the worst sort, and to a very different kind of imitation. For instance, it was when we substituted stucco and cement for stone, lath-and-plaster for real vaulting, and covered up our construction with materials intended to counterfeit real masonry, that our consciences began to be troubled. We began to doubt our own liberty, and threw about reproachful phrases and words which showed the helplessness and dishonesty of our conduct. Adjectival prefixes like "quasi" and "pseudo" are profusely used in the architectural literature of the Later Revival, and other uncomplimentary adjectives may be seen in the writings of those who espoused the opposite schools of art.

We are better and more honest now because both sides begin to see the weaknesses of each, and the last decade or two has given us time to reflect, to take stock of each other's position, and to make advance on recognised principles, and to cool down our antipathies. Though far from being perfect, architects have begun to learn moderation, and to understand the difference between a sham and a substitute. While Brown protests loudly against being taken in by a fraud, he will yet submit patiently to a transaction which does not impose on his good nature or sense. If he knows beforehand that he is going to have cement for stone round his door and window dressings, or an electroplated teapot instead of one of silver, he does not complain. And it is so with decorative substitutes. Mr. Shamhater goes to a West-end restaurant; before him, as he sits at a table sipping his coffee or lemon-squash, is a square pillar of glazed faience, embossed and coloured. Although it looks solid, he is not offended when he knows the faience is merely a casing to an iron pillar which carries the girder above. But suppose the pillar has the shape of an iron column—that it is disguised to look like bronze, while in reality it is merely a plaster casing painted round an iron pillar within. The fraud is apparent, and produces disgust. In painted joinery—imitations of marble and choice woods, shop-counters and doors and dados made to represent marble or mahogany and walnut—the artistic mind

is at once offended by the imposition; but if the same woodwork is painted in flat tints, decoratively, we can hardly call it a sham: we accept the decoration as a conventional mode of treating wood; the tints do not misrepresent anything. The same principle may be extended to a variety of other things. Take a wall: we stucco it, and mark it with joints to represent stone courses. Here we commit a deliberate falsehood; but if we divide it into panels, or paint and distemper the surface, or decorate it with frescoes, we are consistently treating the material as a groundwork for coloured decoration. A jointed plaster vault or arch is a sham; but if we paint its surface or cover the vault with frescoes or mosaics, there is nothing to offend.

But although our shams are not of the glaringly dishonest kind we were wont to see in the fifties and sixties, we have a few still left. First, to take the masonry of our buildings, we still see walls built in such a manner that the amount of stone in the composition of them bears a very small proportion to their thickness. Externally the wall pretends to be all stone, with wide courses, whereas, in fact, it is really covered with slabs of stone jointed to imitate solid masonry. When, to this sort of construction, we add another item, most of our buildings must still be held answerable to the charge of being shams—we mean when such a thin stone-faced building pretends to be solidly constructed in the manner of stonework, with massive projecting pilasters and columns, entablatures, and so forth. The degree of culpability is increased by such a mode of treatment. We cannot object to a well-bonded stone-faced wall, with a sufficient number of "through" stones, and of a reasonable thickness, when it fairly represents itself as such—namely, by avoiding considerable projecting features and boldness of detail; but when these projections in stone are increased to a depth in excess of the facing stones, when cornices and window pediments and pilasters are made to project as if they were constructed of solid stone, "tailed" into the wall, and represented solid masses of stone, there is a real deceit of intention which it would be difficult to excuse. It would not be hard to find numberless shams of this kind, where common honesty would have suggested solid brick. The desire to introduce expensive materials and design at the cost of solidity is generally the origin of shams, and in proportion as we reduce the thickness of the substitute the greater is the deceit. It is true the old Romans constructed walls of concrete with a brick facing—a plan followed by the Byzantine builders; but this construction was dictated by economical reasons. It allowed the carcase to be carried on quickly without waiting for masons, and the walls were afterwards lined with marble or mosaic internally. At St. Sophia masonry construction was honestly developed. The Roman entablature gave way to an honest arched style, in which column and arch were expressed externally, and really performed their functional offices. Thus, as may be seen by anyone conversant with Byzantine feature, the capitals were shaped to receive the arches without the intervention of the entablature. Then the round shafts themselves were monolithic and bronze amulets under the capitals and above the base prevented the shafts from splitting. Our modern masonry does not follow these methods. We cover our walls with stone where brick would be much better; we prefer to adopt the Roman method of false pilasters and entablature, and build arches and columns that do not carry anything. The apologist for sham construction often refers to the masonry in many of our cathedrals where the piers at the crossing are of ashlar with rubble filling—a mode of construction derived from Roman

and Romanesque buildings. But if he thinks for a moment of the circumstances which gave rise to this system, the conditions the architect had to meet, he will find out that this method bears no analogy to modern work. The inert mass of these isolated piers was essential to their stability, and it would have been impossible to build them of squared stones throughout; the walls too, especially of gables like those under restoration at Peterborough, had to be made thick, and would have consumed an immense quantity of squared stone if built solid. But modern cased masonry is often without any of these excuses; in fact, solid work and bonding is necessary in walls of comparative thinness. What are we to say of columns of stone or marble which really carry nothing, as we see in halls and vestibules of buildings, erected simply for effect? The sham column is everywhere: it seems to have become a monument more than a support—something set up as an ornament. Then we have arches constructed merely for show in the fronts of buildings, carrying nothing, which would be served much better by a plain lintel. We admit that both columns and arches may have a decorative character, and may be used ornamentally in design; but only under certain restrictions. It is legitimate to use columns as mullions of windows, or as balusters; but it is exceedingly dishonest to introduce them in a hall to carry what purports to have a weight, or a system of sham vaulting or arches. A wide arch made by cradling down from a girder or lath and plaster is simply a falsehood which no art casuistry can palliate. It may be hard sometimes to draw the line between what should be an honest piece of construction and what decoration—in other words, to say what is a sham and what a decorative feature. Take, for instance, an iron column or stanchion, cased to represent a granite or marble pilaster. We do not see anything glaringly wrong in a marble-cased support, say, to a shop-front: the casing of marble protects the iron, and brings it into keeping with the woodwork of the window, provided it is designed so as not to suggest a solid round column of granite. Still, for all that, a granite or marble-cased column supporting anything is a sham. It would be more honest to use a hard stone solid pier, or to let the iron show itself plainly. Boxing or casing in any form is not honest. A "boxed" marble mantelpiece when it represents a solid construction is a sham; so is a marble-cased beam and an arch. But if used decoratively, the dishonesty is not so great. It would be allowable, for instance, to let in slabs of marble into the interior face of a wall to produce pilasters or a "blind arcading." In this case the motive is apparent: that of decoration.

The modern shop-front is to a large extent made up of shams, from the cornice and fascia board down to the plinth. The object of making a wide plate-glass window appears to be the leading idea. All supports must be disguised or reduced to a minimum, massive construction must give place to hollow casings and decorative adjuncts. All kinds of counterfeits are invented; if the front is to present a dignified aspect to the street, a sham entablature must be cradled or bracketed out from the wall, and the floor below obscured by silvered glass or other devices. Anything is tolerated rather than the honest mode of supporting the wall by piers of substantial masonry. And these subterfuges are aggravated; they are carried up throughout the exterior;—there must be large windows above, with thin mullions and decorations of a flimsy kind. But shams are not confined to commercial buildings. We notice them in the large town or country residence, and even in the church. What is more common now than to see bay windows in which the mullions, which imitate stone, are only cement work

jointed, or if stone, they are mere pieces half a brick thick to hide ordinary deal-cased frames and sashes. The panelled ceiling, it is needless to say, is false;—made up of embossed fibrous plaster under common deal joists and plaster, the ribs, which simulate solid plaster-work, betray their origin. If the ceiling imitates one of panelled oak, it is merely match-boarded with lengths of shallow wood mouldings tacked on. Even the ornamental gables are often nothing but masks. Coming down to details of joinery, floors, staircases, and doors, counterfeits make their appearance; we have the thin make-believe parquet floor, the thin made tessellated tile in which the pattern is all at the surface; cast-iron or turned balustrades, imitating massive oak construction like Knole or Hatfield; flimsy mouldings, cheap door furniture of cased lacquered construction made to look like solid brass-work. Even the joinery of the modern Gothic church-bench or stall will be found in many instances to be devoid of the true character of the old. Many of the stone details are imitations of inner triforium arcades which now no longer exist, and the pier-shafts, instead of supporting the springers of vaults, only disguise them.

In all these imitations cheapness is at the bottom. Cheap fabrics have introduced all kinds of counterfeit. We need only take a few of these. Moulded and carved wood-work and modelled plaster-work have been imitated by embossing on wood. Heavy cylindrical dies, sometimes heated, are made to travel over laminæ of wood, producing the appearance of carved work, and door panels, architraves and friezes, enriched mouldings, bosses, and the like are produced by pressure or by charring. These counterfeit substitutes of carved wood are dishonest, chiefly because they imitate the wood-carver's craft, and the more they imitate the more of shams they become.

Mechanically-produced substitutes for plaster modelling and wood-carving are largely used in our public and commercial buildings. The ornament is embossed in relief. Leather embossed is in itself a useful substitute; but the dishonesty is in imitating patterns which are not suitable for these materials, such as a dado stamped with an arcade design or some architectural features in high relief, imitating columns, ribs, and other details which are only appropriate in stone or wood. Many of our wall decorations of a superior class are genuine and artistic, and it is only when their manufacturers forget they are substitutes and require a distinct treatment that they become dishonest.

BREACHES OF THE BUILDING ACT.

WHAT with building without license from the London County Council, proceedings taken for building beyond lines of frontage, breaches of the rules as to mortar and brickwork, the officials of the Council have all their work looked out, and they are not always without blame. We very often find that a summons is dismissed because proceedings have been taken out under the wrong section, as in a case brought before the magistrate at the South-Western Police-court the other day, or that the proceedings are not legal because the summons had issued against the wrong person. These and other irregularities committed by offenders and by those who administer the law make it more difficult than ever to bring the right parties to justice. The present London Building Act, as we have pointed out, is by no means invulnerable. There are many sections which are doubtful in their operation, others which are ambiguous. But these attempts to evade the London Building Act are not the only ones. We have recorded several instances of late of deliberate offences against local by-laws. Only the other day at

Plymouth Police-court a contractor, and a member of the board of guardians, was summoned by the corporation for no less than five breaches of the local by-laws. These offences were, it is said, deliberately committed and persisted in. The defendant was summoned for erecting premises at the rear of five houses without leaving the 15ft. of open space from house to boundary wall required. Plans of these proposed erections had been submitted but not passed, owing to the want of space; notwithstanding which, the defendant proceeded with the work, and an action was brought against him. The defendant said it was a test case, and that he intended to appeal; a small fine was inflicted accordingly. But he did not appeal, but altered the lane to the required width. The yard space was, however, insufficient, and when the inspector complained, the defendant aggravated the offence; whereupon the town clerk asked for a penalty, and the defendant was fined for each case, with costs. These violations of local building by-laws are common; they show how persistent the owners of small properties are to evade the regulations as to open space when their pocket is concerned. There has been a disposition to treat owners who are also guardians of the poor, or members or officials of the corporation, with leniency and consideration; but experience has shown that delinquents of this class are the most troublesome, and require the firmest dealing with. A member of a town council who is the owner of poor tenements in a neglected part of the town, is frequently the most obstinate to yield to sanitary measures which he has helped to enforce on others. He thinks, for some inscrutable reason, that he is exempted from pains and penalties; and that the letter of the law will not be enforced in his case. It is extraordinary, indeed, that these individuals forget that they have their duties as well as privileges, and that it is their first duty to set an example by seeing that their own premises are without reproach. Building inspectors and surveyors have an arduous duty imposed on them in dealing with properties of this sort to show firmness and impartiality—a very hard task, no doubt, in small towns.

In London, one of the principal difficulties in dealing with evasive owners and builders is in finding out the particular section under which proceedings should be taken. In not a few instances the magistrate has had to dismiss the County Council summons on this or some trivial technical ground. The other day a person was summoned for having erected a building at the rear of some "mansions" near Clapham Common without a license from the Council. The defendant was fined, but continued to allow the building to remain. Another summons was taken out for the recovery of cumulative penalties; but the summons was dismissed because the magistrate thought the proceedings were taken out under the wrong section. It appears strange that such a mistake could be made; but those who know anything of Building Act are aware how easily such a mistake can occur. Another summons was issued, and the defendant's counsel raised the question that the wrong person had been summoned. It appears that the defendant had sold the property to some other person, and it would be unjust to punish a man for not doing what it was impossible for him to do. In the end the magistrate has given judgment for the Council; but it will be seen that this is one of the real difficulties that have to be met in carrying out the Act, and that upon technical legal points of this sort the operation of the Act is likely to be seriously hindered. Indeed, it is possible to foresee how very easy it is to evade the law in this way. The sooner these legal points are settled the better. The question in dispute—that of erecting a building at the

rear of premises already built—is one that concerns the public welfare; but the owner of property has to consult his tenant. If he is a baker or a tradesman, who wishes to extend his shop backwards or to erect a baking-house or a workshop, and is willing to take a long lease of such premises, the owner is inclined to accede. He probably does not know the provisions of the Act at the time, and the work is proceeded with. The illegality of the erection at last makes itself manifest; he is summoned, and, of course, tries to evade his responsibilities. The temptation to erect or extend premises on open areas in London is great, and becomes more so every year, and the County Council work in preventing this encroachment is no doubt arduous. Section 41 and its various provisions are not very easy to understand. The 150sq.ft. provided at the rear of domestic buildings is little enough, and it ought to be jealously guarded. The other subsections relating to "diagonal line," irregular boundaries, abuttal on a street, corner buildings, &c., can only be understood by those who have studied the Act, and we think it would be well if those provisions were made more popularly known by plans and diagrams.

Sanitary inspectors of vestries often have to summon builders for not complying with the regulations. The question, "What is a 'new' drain?" is one of the points often raised. An old drain is found to be stopped, and the owner or builder puts a pipe drain in its place, taking up the old. Is this a repair or a "new" drain? If the latter, the sanitary by-laws require the putting in of an intercepting trap between house and sewer, and the provision of inlet and outlet shafts, in which case some extra expense is involved. A case of this kind came before the Lambeth Police Court lately. A builder was summoned for not complying with the regulations. He had taken up an old brick drain, and in the same channel had put down a pipe drain. It was contended by the vestry that the work done amounted to the construction of a "new" drain, and that this necessitated the insertion of an intercepting trap and inlet and outlet shafts. The defendant contended that it was a repair to an existing drain, and that the vestry could not enforce the extra work to be done. The work was the old drain altered and repaired, not a new drain; the same channel existed as before, Mr. Denman said the drain had been made better than before. Upon this ground he dismissed the summons, the costs falling on the vestry. According to Mr. Denman's decision, a drain was the channel along which the drainage went, and in such case he thought the drain was only altered and repaired—a conclusion which will be thought reasonable and fair by owners generally, though rather prejudicial to the authorities, who appear to wait for any alteration or repair in order to enforce their regulations. A line, of course, must be drawn somewhere between a repair and a new drain; but the decision will commend itself to all who only desire to make their old drains efficient for their purpose. Like the adjectives "new" and "old" applied to roads and buildings, the "new" drain definition is open to constant misunderstanding.

"BUILDING NEWS" DESIGNING CLUB.

A TEA AND COFFEE RESTAURANT.

THIS is the last subject given in the past session of our club, but we are not sure that the designs sent in are to be reckoned as the best of the 1896-97 series. The problem does not afford the scope which some competitors like: its limitations restrict their fancy, and the conditions necessitate thought, which means effort, and then, of course, especially in fine, warm weather, not a few begin to question as to its being worth while. No one is likely to succeed without effort, and trials of strength judiciously chosen

are seldom made without increasing the power and experience of those who undertake them. "Nap" takes the first place, "Pantile" comes second, and the third in merit is "Pickles." We are not inspired by the originality of the chosen façade, but it is by no means devoid of a common-sense suitability. The turrets would scarcely be seen, and the roof ridge would be lost. The plans show skill, and, in many respects, they are all well worked out. The w.c. window in the basement is too near that of the larder to be nice. The ash-bins would be best standing in the yard, and this w.c. could then be readily shifted. The main floor at shop level looks like what was asked for, and the service is well under control. "Pantile" has more than a notion in his elevation, which, however, is not worked out skillfully with regard to good proportion. This defect is increased by the poorly-drawn perspective, and if the author had that keen sense of relative values which go to make up what is called "good proportion" in design, he could never have crushed down the soffit of the big oriel bay into the voussoirs of the arch below in the manner in which these features show in the view. The same remark applies to the otherwise unobjectionable panel in which the sign appears. The whole thing wants lifting up. If worked out well, this elevation might be made to look very striking. The plans are not so good as those placed first. "Pickles" has hardly done his proposal justice;—his drawings are so sketchy, and the coarse-hatching to the plans makes them look confusing. The perspective redeems the sheet, and a further good point is obtained by the reserve which governs the design generally. The conditions published for the direction of competitors were as follow:—"A Tea and Coffee Restaurant for a Suburban Street.—The site has a frontage of 25ft. and a depth of 60ft. The adjoining houses are 28ft. to top of parapet, but this need not exactly limit the height of our intended building. On the ground-floor a bar and refreshment-room are to be contrived all in one apartment, as large as possible, after providing a private-way passage 4ft. wide from the street and a staircase up to the manager's rooms above, and, after allowing for a rear yard not less than 10ft. wide the narrow way, and large enough for light and ventilation to the basement, where the kitchen, scullery, and larders, &c., are to be located. A lift to run up from kitchen through the shop at rear of bar to the first floor. A men's refreshment-room is to be provided, where smoking is allowed, on the first-floor back; a ladies' room, reached by the same staircase out of the shop, is to be placed on the first-floor front. A ladies' w.c. will be required in a convenient and well-screened position. On the second floor the manager's residence, with one parlour, one bedroom, a bathroom, and w.c. to be arranged. In the attic floor above, three bedrooms for female servants are included, with a w.c. for their use. The depth of the house above the ground floor may be 30ft. from the street frontage. The shop floor to be 14ft. high, first floor 12ft., second floor 10ft. from floor to ceiling. The elevation is to be treated architecturally, with an allowance of 6ft. total space for width of piers to the ground story. The side door to be 3ft. wide in the clear, so that the shop-front opening will be 19ft. Plate-glass to be used, at any rate in the lower panels of the shop sashes. The shop doorway to be wide, and placed where most convenient. Material: Hop-tonwood stone below, with brick above the first-floor level. Style optional. All cornices to stop 6in. short of the limits of the façade, and return in themselves against the wall. A wrought-iron sign may project above shop-front from the house not more than 5ft."—"Tyke" has good large windows to his façade, and some big dormers with curved tops to give contour to the skyline. The ground-floor story is treated in ashlar, with an arched shop and main entrance. The plans have some good points, but they are somewhat cramped in their contrivances. "Orb" has considered his scheme more fully, but the front shop, which he figures as a "refreshment-room" is really so much waste space, and the bar is too far back for counter business, and, placed as "Orb" shows, the rear shop is crowded into half the space which it should occupy. "Ulan" has the same contrivance for the bar, with the further objection that it is out of view from the entrance, and supervision by the manager behind the counter is out of the question. The staircase coming down directly on to the staircase door is a most ill-arranged affair, which would almost always be blocked at busy times. The elevation is mean and uninteresting, a remark equally applicable to

"Agon's" design. There is no comfortable corner in his ground-plan, and no sense of convenience so attractive in a well-ordered refreshment-room. We think the author would do himself more benefit if he devoted more time to his work. "Mist" sends a neatly-delineated common-place design, which gains much by the breadth obtained through leaving a blank space pierced only by a small window over the private entrance, which could not easily be mistaken for the shop or public entry. Customers, too, would not, in passing out, escape the counter and pay-box. It is of the first consequence to a shop-keeper that his customers should have his wares brought prominently before them. "Mist" fails for want of thought. Thus, to locate the ladies' w.c. off the landing of the public staircase is a very thoughtless thing to do, and, besides this, a lift of this kind ought never to be served from a semi-public lobby, as here drawn, on the first floor. "Whitefriar" is a poor draughtsman, devoid of the sense of any originality. The ground-plan of his design is the best part of his contribution. "Mannikin" includes his two chief floors within the limits of a great archway, into which project the windows of his ladies' room. Some public-houses have lately been managed in this way, but the idea is not developed satisfactorily by "Mannikin." "Look" throws out his shop-front like a bow-window into the street beyond the pavement line. This he would not be allowed to carry out. "Don't Know" comes last without a word of protest. Possibly, if he did know, he would rank higher.

THE NEW GOVERNMENT OFFICES.

THE Select Committee appointed in March last to inquire into, and report upon, the manner in which the sites available for the erection of the new buildings required for Government offices might best be appropriated for that purpose has issued its report, which says that, after having taken further evidence upon the plans laid before the Committee in 1896, in the course of which representatives of the council of the Royal Institute of British Architects and other qualified members of the architectural profession were examined, the Select Committee has arrived at the following conclusions:—

"We are of opinion that the new public offices on the 'Parliament-street' or 'Great George-street' site should be erected mainly on the lines of plan No. 1 in the appendix to the report of last year, with a frontage in a line with the frontage of the Home Office, and parallel to the east side of Parliament-street; but we recommend that the south-eastern corner of the new building should be square and not rounded. The land between this new frontage and the present west side of Parliament-street would, if this plan were adopted, become part of the public street; and, in our opinion, there is no need to make special provision for separating the traffic at this point. It appears to us reasonable, in view of the great Metropolitan improvement here to be carried out at the cost of the Government, that the London County Council should be requested to consider whether they should not put into operation the powers possessed by them under the Public Offices (Westminster) Site Act of 1896, and contribute a share of the total value of the land, which under this scheme would become part of the public street. We recommend the appropriation of this site for the Board of Trade, the Education Department, and the extension of the Local Government Board. As regards the Whitehall site, having considered the alternative schemes for the War Office which have been placed before us this year, we adhere to the recommendation made in our interim report, being satisfied that a building satisfactory in appearance and accommodation can be erected on that site within its present boundary lines; and we are of opinion that the details as to the arrangements of buildings, courts, &c., should be entrusted to the discretion of the Office of Works, in conjunction with the architect selected. We think that a subway should ultimately be formed under the street between the War Office and the Admiralty. Schemes have been submitted to the Committee by the Royal Institute of British Architects and by Colonel Edis for a widening of Charing Cross and of the northern part of Whitehall; but we cannot recommend that the taxpayers should be asked to bear the cost of this Metropolitan improvement, which, if undertaken, comes more properly within the duty of the local authorities. We, however, strongly advise that

the Mall should be opened into Charing Cross on the north side of Messrs. Drummond's bank. We think that no decision should be arrived at as to building on the triangular site in Spring-gardens until the houses standing there have been removed, and the ultimate requirements of the Admiralty considered. We recommend that Nos. 11 and 12, Downing-street, occupied respectively as a residence for the Chancellor of the Exchequer and as an office for the Patronage Secretary to the Treasury, should be removed, as unworthy of the site they occupy; but we are of opinion that the principal block of No. 10, the historic residence of the First Lord of the Treasury, for reasons of practical necessity and on account of its associations, should be retained, the Downing-street front being masked by erecting a new building with a good architectural façade, and the park front being cased in stone, so as to harmonise with the north and west fronts of the old Treasury buildings, and the garden ground being inclosed with a screen or railing of handsome design. We do not recommend any further building on this site. We are of opinion that whatever other office accommodation is required which cannot be conveniently found in existing Government buildings should be provided for by an extension of the Great George-street site in the direction of Delahay-street and St. James's Park, in which case some readjustment of the arrangement at present shown in the plan of the Office of Works might have to be made."

THE PASSMORE EDWARDS SETTLEMENT.

THOUGH the new buildings which are being erected in Tavistock-place, St. Pancras, for the new Passmore Edwards Settlement will not be entirely ready for occupation till the beginning of the new year, and will not be formally opened till then, the work of the settlement will commence in October, under the newly-appointed warden, Mr. R. G. Tatton, formerly Fellow and Tutor of Balliol College. The settlement is intended to carry on and to develop on extended lines the work of the University Hall Settlement established by Mrs. Humphry Ward in Gordon-square some six or seven years since. The new buildings, towards the erection of which Mr. J. Passmore Edwards has generously contributed the sum of £12,000, will contain a concert and lecture hall, seating 450 persons, classrooms, library, gymnasium, and a large drawing-room and dining-room for the social purposes of the settlement, together with rooms for a warden and 18 or 20 residents. They are being built by Messrs. Higgs and Hill, of South Lambeth, from plans by Messrs. Smith and Brewer, and were illustrated by a plan and perspective in our issue of July 3, 1896. The exterior is of red brick with stone dressings, and a cornice of Portland cement painted white; the roofs are covered with Westmoreland slates. His Grace the Duke of Bedford, who has given most kindly help to the settlement throughout, allows the council the use of a small neighbouring piece of ground as a garden at a nominal yearly rent. Mr. G. F. Watts, R.A., Mr. Norman Shaw, R.A., Sir John Stainer, and others have given invaluable help and advice during the progress of the buildings. The council has been considerably widened, and includes among its members representatives of the University Extension Society, the Working Men's College, the Working Men's Club and Institute Union, and the London School of Economics. Mrs. Humphry Ward retains the position of hon. secretary, and Mr. A. L. Leon, L.C.C., will act as hon. treasurer. The programme for the coming session is in hand, and among the subjects of University Extension and other lectures are English history, architecture, and economics; Professor Lewis Campbell will lecture on "The Tragic Drama," and the Rev. P. H. Wicksteed will give his introductory course on "Dante." Classes in domestic economy and hygiene have also been arranged in conjunction with the Technical Education Board. The large concert-hall and fine rooms of the settlement will be used, however, not less for the social enjoyment and recreation of the crowded working-class neighbourhood on the edge of which the settlement stands than for purposes of education. A series of Sunday popular concerts is already arranged for the coming winter; orchestral and choral classes will be started at once; and arrangements have been made for the placing of an organ, when

funds permit, in the large hall. There will be an admirable gymnasium, which, apart from the use made of it by the settlement, will probably be in demand before long by the board schools of the district. The library, to which special contributions are desired, will be called the Green Library, in memory of the late Professor T. H. Green, of Balliol. The encouragement of Biblical study was among the original aims of University Hall. To place this on a permanent basis a "Jowett Lectureship" has been established, to be under the management of a special committee, for which the council has secured the services of Dr. Edward Caird, Master of Balliol, Canon Cheyne, Professor Lewis Campbell, Professor W. M. Ramsay, Rev. J. Estlin Carpenter, and Mr. Claude Montefiore. The Rev. R. F. Charles, editor of the "Book of Enoch," has been appointed the first lecturer. He will deliver a course of lectures in the spring on "The History of Jewish Religious Thought during the 200 years before Christ." The Jowett Lectureship and the settlement itself will be entirely unsectarian, and it is hoped that the new hall will become a centre of educational and social life for the west-central and north-western districts of London, such as East London has found in Toynbee Hall.

THE CARPENTERS' COMPANY AND KING'S COLLEGE.

THE winners of the medals, &c., presented by the Carpenters' Company to students in the classes conducted under the auspices of the Company and the council of the College are as follows: Building Construction Day Classes, under Professor Fletcher: Gold medal and £3, H. C. Bishop; silver medals and £2, E. F. Knight, A. J. West, and C. W. Myddleton; bronze medals and £1, G. A. Turner, W. Shelley, and A. E. Puffhead. Evening Classes: Gold medal, J. G. Wiles; silver medals and £3, F. G. Pain, S. A. Switzer, and P. C. Blow (medal only); bronze medals and £2, C. W. Beaumont, C. J. J. Dadd, H. C. Bishop, H. Gloyne, W. Marchmont. Lord Mayor's medal for sanitary building construction, A. Carter. J. Kent, S. A. Switzer, T. Graves, J. Gough, W. Drake, and C. J. T. Dadd have also won money prizes. All prizes of money are given in books to the value of the prize won. Wood-Carving Classes (amateur): Silver medals, Miss Carpenter, T. Ainsworth, and John Dunn; bronze medals, L. A. Waldron and A. J. South. These medals are accompanied by scholarships, tenable at the classes at King's College. These prizes will be presented by Sir Henry Harben at a soirée at King's College on Sept. 30.

A BRIDGE WITH A HISTORY.

AMID the destructions, constructions, and reconstructions which have some time ago passed the preliminary stage, and are now in active progress under the protecting ægis of the Parisian Exhibition of 1900, is a bridge which deserves a passing notice. The first London Bridge, it is stated, was built in the 11th century, and, being constructed wholly of timber, was subsequently burned, as has been the fate of innumerable similar and dissimilar structures composed of the same inflammable material. Passing by old London Bridge, which, with its streets of houses, had a very long existence, we find that the present, or new London Bridge, was opened in 1831. We mention this date, because many people think that the present London Bridge, which is built of stone, is older than some of the iron bridges spanning our great Metropolitan river. As a matter of fact, both Southwark and Vauxhall Bridges are older than their confrère lower down the stream, the one being erected in 1816, and the other three years after.

In order to provide access to the exhibition for the vast multitudes which will throng to the gay French capital in about three years' time, it has become necessary to not only widen, but increase the present number of approaches, especially of the bridges over the Seine. Consequently, the reconstruction of a very old bridge, taking its pedigree into account, has been decided upon. The name of the bridge is the Pont au Change, and a brief account of the vicissitudes, the different structures bearing the same name, and erected successively upon the same site, will not be without interest. Previously to the 10th century, the ground was occupied by a wooden bridge, whose antecedents are irrecoverably lost,

although during its long life it constituted the only communication between the two banks of the Seine. The bridge owed its name to the fact that Louis VII. established in its vicinity the "Exchange," and, similarly to London Bridge, the money changers, jewellers, and marine store dealers housed themselves in the dwellings ranging along both sides of the structure. Several times this bridge was seriously damaged by the flood-waters brought down by the river, but a century later saw it substantially reconstructed, partly of timber, and partly of good solid stonework.

In the 13th century it was rebuilt entirely of masonry; but owing to the preposterously large dimensions assigned to bridge piers in those times it was again swept away during a violent storm. At this stage a retrograde departure, so far as the constructive arts may be considered, was introduced. The new bridge was built altogether of timber, and while the open character of the piers preserved it from the destructive action of floods and inundations, it failed to afford it a like immunity from the devouring element, for it was totally consumed by fire about the year 1630. A period of eight years was required to erect the next structure, which had a long life, and did not retire from the performance of its ordinary duties until half a century ago, when it was replaced by the present structure, which it appears is now, in its turn, to make way for a successor. T. C.

FIRE AND RUST PROOF PLASTERING.

GENERAL W. SOOY SMITH, the United States Government Supervising Architect for Public Constructions, has issued the following note on the best means of rendering iron and steel constructions perfectly proof against corrosion and the effects of heat:—

"Rust, under favourable circumstances, will eat to one inch depth in iron in eighty years. This means that the steel buildings in Chicago, as they are built to-day, may not survive more than thirty years. To make them perfectly safe corrosion of the steel must be prevented. This is a thing to be accomplished by the use of the new fireproofing material, but I will first consider the effect of fire. Owing to the combustible material in buildings, the present fireproofing as applied to modern buildings will be heated to redness very quickly. Then along come the fire engines and throw a stream of cold water upon the heated parts of the buildings. To be good, the fireproofing must be able to resist the combined action of red heat and cold water. I have tested nearly all the best fireproofing employed in this city, but not a single one have I found that can be heated to redness and plunged into cold water without cracking. Some of it literally burns up. Some will stand red heat without cracking, but none will withstand the combined action of heat and water as described. Another trouble lies in the fact that nearly all the so-called fireproofing material is a good conductor of heat, a thing which makes it valueless as fireproofing, permitting, as it does, the passage of heat to the steel. The rigidity of steel, without being heated to redness, decreases considerably when the temperature rises above 400° Fahr. In this city the fireproofing in any building containing a moderate amount of combustible material would, should the structure take fire, be heated beyond that degree, and even to redness. Then the columns would yield, and the building come down with a crash. The danger is increased owing to the fact that with a moderate rise of temperature in a steel building the beams and girders of the floor systems would expand unequally as the heat varies. These unequal expansions would throw the columns out of the vertical and into a buckling position. Instances of this are shown in the fire which destroyed the Manhattan Life Insurance Company's building in New York. The structure was destroyed, although the fire which caused the disaster was in a building 50ft. away. The building of the Chicago Athletic Association was on the point of falling from the same cause, although the fire did not last half an hour. In this case the columns of the lower stories were completely stripped of fireproofing by the action of the heat and water. Fireproofing, to be worthy of the name, must resist the combined action of heat and water, and be a non-conductor of heat. In trying to find a material that would serve the required purpose, I first tried talc, which is a good non-conductor and very refractory. Soapstone is an impure talc. By mixing this in a pulverised condition with

hydraulic cement and other substances, I succeeded in making a good fireproofing material. While conducting these experiments I heard of a material in the great asbestos mine near Montreal, Canada. There is found in that quarry serpentine rock carrying a large percentage of asbestos. This rock, pulverised and mixed with good cementing materials, makes by far the most perfect fireproofing yet discovered. 'Asbestic,' as the new material is called, is invaluable for use in a general way as fireproof plasterings, in all sorts of buildings. It will prove especially so in its application as fireproofing for covering the steel parts of buildings. It may be heated to 1,100° Fahrenheit (red heat) without harming its durability. Nails may be driven into it and it will not crack. When the nail is removed, nothing but a small hole remains, which may be readily filled with putty or any other substance, in order to restore the finish of the wall. Struck with a hammer, there is no breakage—only the indentations showing. Then, again, the material is elastic. If the building settles or sinks, it stretches, and the plastering is not marred. Another point is that it will take decoration equal to canvas without danger of the picture being destroyed should the walls settle. This material is a thoroughly fireproof plastering. On this I will stake my reputation as an engineer. I have experimented for many years, and I know what I assert. Another point of interest is the weight. It is a third less than ordinary plaster covering the same area. Thus it is that the weight of this asbestic plastering will be so much less than the ordinary article that there is a large diminution in the weight borne by the columns in the building. This will allow a considerable saving in steel—more than sufficient to pay the slight excess of its cost over common plastering.—Chicago, July."

Samples of asbestic plastering on expanded metal can be inspected at the offices of Messrs. Witty and Wyatt, Ltd., 88, Leadenhall-street, London, E.C.

THE ARCHITECTURAL ASSOCIATION EXCURSION, 1897.—II.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

CONTINUING our illustrations and references to the buildings chosen for examination, we arrive at Ark Hall, which was visited on Tuesday. It is a simply-designed manor house, as may be seen by the sketch accompanying these notes, with plain mullioned windows and gables quaintly grouped, while the leading feature in the entrance front consists of a boldly-treated hooded doorway flanked by Ionic columns and capitals, an heraldic device growing out of the keystone occupying the tympanum; of this we shall give some details. Inside the hall there is a florid chimney-piece and good wainscot panelling up to the ceiling. The walls, like a good many 16th-century stone houses, are very thick, and the hall was the ancient seat of the Curwens. We reproduce Mr. J. Harrison's sketches herewith. Of Borwick Hall, the first halting place on Wednesday, we give among our plates to-day a series of drawings by Messrs. R. W. Johnson, E. Turner, and S. Wright, from the "John o' Gaunt's Sketchbook." The plans given to-day add value to the carefully measured elevations which accompany Mr. E. Turner's perspective. A drawing of Borwick Hall, by Mr. Maurice B. Adams, will be found in the BUILDING NEWS for December 31, 1886, when we also gave a block plan and other drawings. The present house was erected in 1595, in the reign of Elizabeth, but the square-built Peel, round which the building is grouped, bears evidence of an earlier date, perhaps as far back as 1559. There is a quaint old gatehouse in stone, put up in 1650, which, together with some farm buildings, forms one side of the forecourt quadrangle and face the road. The great hall is panelled in dark oak to within a few feet of the ceiling. The arms of Bindloss impaling West occur over the fireplace. Some of the other rooms are also wainscoted. The private chapel occupied the position of the apartment to the left-hand front on the first floor, and out of it was reached the priests' closet, under which was the priests' hole, still existing. Here the hunted Churchman could, by pressing a floor-board, open a trap and seek refuge, and so elude, for a time anyhow, the vigilance of his foes. Sir Robert Bindloss entertained Charles II. in this house on an August night in 1651, when that king was on his way to Worcester, a few days really before he

himself, to save his crown and his life, had to seek sanctuary in a similar hiding place to that which his host at Borwick may, indeed, have shown him. The priests' "hole" which the king used was most probably at Trent Manor, near Yeovil, in Somerset. The house has been only partly occupied of late years, which, in some ways, to the architect, may be an advantage, because it has not suffered from over repair. The detail is very simple, but the design is very broad and picturesque, with the windows admirably placed. Hoghton Tower, of which we shall give a photograph next week, was visible, and we

shall reproduce some measured details and an elevation of the great hall by Mr. W. A. Waddington,* facing the inner court (in an early number of the BUILDING NEWS). The house stands on a lofty eminence midway between Preston and Blackburn, and can be seen for many miles, commanding the landscape and overlooking the Darwen, the Ribble, and the Welsh mountains in the distance. The great extent of

* A sketch by Mr. John Langham of this part of Hoghton Hall, from the Royal Academy, appeared in the BUILDING NEWS for May 2, 1890, when he also published a view of Marple Hall, Cheshire.

this old mansion gives it the appearance of a village, and occupies a natural plateau about 500ft. long by 300ft. broad. Towards the west is a central gatehouse with towers right and left at the angles of the first quadrangle, all battlemented. To the north of this courtyard are the stables and kitchens, the retainers' apartments being located on the south side. The inner quad is divided off from the first buildings by a block long used as bedrooms and other family apartments. During the Civil Wars a fine tower, which stood over the second gatehouse, was destroyed. The way in which the approach to this inner portal is

contrived, with walls and piers at the top of a flight of steps, is singularly interesting, and, of course, is very well known. The great hall to the north of the inner court is approached by some circular steps, and at the east end of this hall stood the Chapel, set at an angle with the main buildings, in order to orientate the altar correctly, thus adding much quaintness to the plan. The ruins of this sanctuary only now record its position, situate at the end of King James' rooms, so called because the Scotch king was, it is said, royally entertained here in 1617 on his way to London by Sir Richard de Hoghton. The great hall has two large bays, one on either hand of the high table; these "bowers" are unusually large, being 10ft. deep and 12ft. wide, while the height is proportionate, the hall itself occupying the same space as that allotted to the two-storied building next to it. The fine inglenook on the north side, the buttery hatch, and the Jacobean minstrels' gallery greatly add to this charming hall. The oaken-panelled guinea-room is to be seen, with gilded decorations, representing, it is said, the rent-roll of the estate; it is a curious apartment in the south-west corner of the upper quad. Sir Charles de Hoghton renovated the mansion, but it was for a long time left in great dilapidation. The views from its walls are magnificent. The measured drawing accompanying these descriptive particulars shows the dining-room chimney-piece in Levens Hall referred to last week, when we gave some pictures inside the house. This delightful residence was seen on Wednesday, with its oddly-contrived gardens of cut yews, clipped hollies shaped in fantastic forms resembling birds and bottles, donjons and judges' wigs, ovens, and dumb waiters, all designed by Beaumont, the king's gardener from Hampton Court, where he planned the gardens. Inside the house there is much fine old oak furniture, and the wonderfully rich chimney-pieces, some of which figured in our last number, are a great feature. In the dining-room Samson and Hercules support the mantelpiece, and the "Four Seasons," with the "Five Senses," furnish emblematical figures in the same apartment. Holker Hall, belonging to the Duke of Westminster, is an exceedingly handsome house, containing some notable pictures by some of the best masters, including Rubens, Claude Lorraine, Hans Memling, Dürer, Vandyck, and Reynolds. Messrs. Paley and Austin greatly enlarged the house, and their work will amply repay examination, both inside as well as out, and the carved oak furniture, long in use here, adds much to the interest of the mansion, which is situate in a gently sloping park, well-stocked with deer, on the banks of the Leven, and surrounded by beautiful woods. The picturesque crag-seated village of Grange concluded Tuesday's proceedings. Samlesbury Hall, six miles from Preston, was seen yesterday. It is illustrated in Parker's "Domestic Architecture," and was originally built in 1548. The building was formerly quadrangular, but is now L-shaped, the servants' wing having fallen into decay, and the family apartments are occupied as domestic offices. The house suffered from restorations about 1835, when it had been used as a public tavern. The old minstrels' gallery, screen, and posts remain, more or less mutilated. The domestic chapel has long done duty as a parlour, and its screen was destroyed. The quatrefoil panels in the half-timbered construction of the remaining wings have a rich effect, and the upper-floor oriels are pretty, set under the deep cove below the eaves. Livesey Hall was the next place visited after an hour's stay at Blackburn for lunch. It is a small stone-built dwelling of rugged simplicity. A view of it, by Mr. J. Langham, will be found in the *Building News* for December 12, 1890, and another, by Mr. Harrington, on June 6, same year, from the Royal Academy exhibition, giving an excellent representation of the old place. It seems to have been erected at three different periods—the central portion in 1608, the east wing in 1666, and the other wing in 1689. The premises are occupied partly as a farmhouse, but half of the house has for a good while been dilapidated and unused, likely to go entirely to ruin. In front of the house, formerly, a formal garden within inclosing stone walls made a pleasing feature, thoroughly in keeping; but the best days of Livesey are gone, and the imagination of the visitor has to fill in the blanks of the picture. Furness Abbey will occupy the attention of the excursionists the whole of to-day (Friday). Further illustrations will appear in the *BUILDING NEWS* next week.

SCIENCE AND ART SCHOOLS.

THE forty-fourth annual report of the Department of Science and Art to the Committee of Council on Education was issued on Saturday. This shows that in 1887 the science schools numbered 1,684, the classes 6,300, and the students under instruction 103,088. In 1896 the figures were 2,583, 10,300, and 196,185 respectively. Of the 2,583 schools in 1896, 144 were organised science schools with 16,654 students. This is a considerable increase on the preceding year. The number of students who came up for examination from these schools was 91,300, a decrease of 16,863 on the previous year. Besides these, 8,518 self-taught students and pupils from classes not entitled to claim payments on results presented themselves for examination. 30,066 out of the 99,818 students who were examined were successful in passing in one or more subjects, and of these 16,551 were successful for the first time. In the previous year 52,079 were successful, and 22,542 for the first time. For the year 1896, the payments to science schools, exclusive of those made to training colleges, on the results of examinations, and on attendances, &c., amounted to £157,916. The corresponding amount for 1895 was £142,542. In the art division, the report states that during the year ending August 31, 1896, 20,161 elementary day schools, with 2,250,070 scholars, were taught drawing and examined under the regulations of the department. This was an increase of 263 schools, and of 57,820 scholars, as compared with the numbers in 1894-5. Besides the scholars who were taught in the drawing standards, 18,209 pupil-teachers and ex-standard scholars were examined in drawing, of whom 8,859 were successful. The grants for drawing in 1896 to elementary day schools amounted to £176,224; in 1895, to £164,494; and the number of schools gaining the awards fair, good, and excellent, respectively, was as follows:—In 1896: Fair, 848; good, 12,850; excellent, 6,391. In 1895: Fair, 1,484; good, 13,323; excellent, 5,051. 873 evening continuation schools were also examined, in which 40,459 scholars were taught drawing, the grants earned by them amounting to £2,105. In the previous year the number of evening continuation schools taking drawing was 698, with 37,640 scholars, the grants amounting to £1,664. Classes for manual instruction in connection with 1,069 elementary day schools were examined in the year ended August 31, 1896, and earned grants amounting to £19,530, on account of 83,220 scholars. In the previous year the number of manual instruction classes examined was 910, and the grants earned amounted to £16,307, on account of 67,470 scholars. The number of art schools and classes (including 80 science schools which take art subjects) examined in art in 1896 was 1,851, as against 1,853 (which included 91 science schools) in 1895. The number of students in 1895 was 136,768, and in 1896 146,193. The number of students who were examined in 1896 was 78,139, or two less than the previous year.

ASBESTOS AND ASBESTIC.*

A NEW and completely remodelled edition of this exhaustive treatise on the special properties of the new form of asbestos found in Canada is of much value just now. The author, Mr. Robert H. Jones, F.S.A., mineralogist, has brought to his labours a vast amount of information; he has observed what has been done in Canada, the many important changes in machinery, and the progress made in other countries. The discoveries at Danville are reserved by the author for special description. The peculiar character and value of this mineral fibre, and the particular mine identified with its production, have developed a new industry of much promise. In a short space of time this particular mine from which asbestic comes has stepped in front of all other mines, and has revolutionised the whole industry. The "mine is situated near the boundary of the most western part of the eastern townships of Quebec, ninety-seven miles from Black Lake, and only four from the pleasantly-situated agricultural town of Danville. It is also about eighty-six miles from Montreal." It was opened in 1879, and was worked by Mr. Jeffrey for some time, but the peculiar nature and value of the mineral was not well known. Mr. Boas, of

* Asbestos and Asbestic: their Properties, Occurrence, and Use. By ROBERT H. JONES, F.S.A., Mineralogist, &c. London: Crosby Lockwood and Son.

St. Hyacinthe, an epoch-making man, examined the rock, acquired the mine, introduced automatic working machinery, and in a short time the mines began to assume activity of a surprising kind. Mr. Boas soon discovered the true nature of the rock, and his first idea was to utilise the material as a plaster or cement. Every part of the fibrous rock can be utilised. Mr. Jones says, "After yielding from 20 to 25 per cent. of Nos. 1 and 2 merchantable asbestos, the whole of the remainder, which was formerly treated as waste, is now found to consist of fibrous material of extraordinary value, known under the name of asbestic, which is simply short, unweavable asbestos, the like of which is to be found in no other part of the country." The beautiful colotype plates and other illustrations in the text give the reader an excellent idea of the veins of chrysotile which permeate the rock in more or less regular lines. These veins contain the finest silky fibre. The author, who spent some time in these mines and examined the material after it was blasted, calculated that the whole mass contained at least 90 per cent. of good merchantable asbestos or asbestic, or fibrous material, which only required crushing and screening for conversion into those products. His account of the uniqueness of this material is interesting: how he rubbed some of it up in his hands like tobacco, which converted the material into a "snow-white pellet of soft elastic fibre," and that he found at Danville specimens of "a clear, light-coloured translucent serpentine, which partly covered a vein of pure silky fibre, as though protecting it with a rich delicate skin, the tint of emerald." This unique specimen is illustrated in the frontispiece. The value of asbestic as a material for building we have noticed before. As a mortar or plaster it has great claims; its fibrous and flexible nature and smooth glossy surface prevent it from cracking. It can be put round a tin pipe, or on raw brick; it requires neither hair nor sand. When once dry it is as hard as cement. Of course, too, it possesses all the valuable qualities of a non-conductor of heat and sound, and is therefore admirably adapted for music-rooms, halls, hospital wards, &c.; it is vermin-proof, noiseless, and unflammable. As a labour-saving material it has special advantages: it can be easily mixed, has a large covering power, and saves at least 25 per cent. on labour. The officials of the leading Government departments at Washington and engineers in charge of the New York City Post Office have made a trial of this plaster. A structure was erected, the whole of the interior was plastered with the new asbestic wall-plaster, and the whole was subjected to flames and water; but the plaster remained intact after the test. In New York, Montreal and Ottawa, buildings are plastered with it. The chapter on the applications of asbestos to building and fire-preventive purposes is worth perusal; its use for boiler and pipe coverings, paint, the "Salamander" decorations of the United Asbestos Company, which are well known to all our readers, are separately treated, and those who want to become acquainted with the many valuable applications of this mineral to various purposes will find Mr. Jones's new volume of much interest. The colotype plates add much to the descriptive value of the work.

SANITARY IRONWORK.

WE have received a new catalogue of sanitary and hydraulic ironwork issued by Messrs. Adams and Co., engineers and sanitary specialists, of York and Leeds, whose London offices are Old Queen-street, Westminster. Our readers know the many advantages of the Adams' patent automatic flushing siphon, which is extensively used, and can be adapted to suit varying conditions of locality. Several types of flushing chambers are shown, from a chamber with taper and vent flushing one sewer to other more complex forms. An inquiry by the Douglas commissioners of 79 corporations has shown the use of 64 per cent. of Adams's siphons as against 36 per cent. of other makers. The siphon is unequalled in simplicity of construction and absolute certainty in work. We may also notice Adams's patent system, license to use which is granted, free of extra charge, with each siphon sold. An important feature is that two or more siphons can be supplied to discharge simultaneously, where necessary. They are made also with rectangular outlets for distributing liquid over large areas and filter-beds. Any desired velocity of discharge can be

given, and the depth of tank may be small compared with other kinds. For lifting sewage automatically and for sewage disposal, the siphon has been applied with success. Adams and Co.'s patent "insular" valve, which serves as a flap valve or penstock, is an excellent substitute, and the patent combined penstock valve is a useful, economical water-valve. Another useful appliance for drawing off top water from settling tanks, &c., is Adams's patent floating arm and effluent float, an extremely simple contrivance, which can be adjusted to any depth of immersion. Other sanitary castings, manhole and lamphole covers, tide and flap valves, ventilating columns, and details of Adams's patent sewage lift of various forms are given in the catalogue.

REPRODUCTION OF PLANS AND DRAWINGS.

IN *Ombres et Lumière* the following process is described by A. Carteron:—A well-sized paper is selected and cut rather larger than the drawing to be copied. An ink is prepared by dissolving 8 to 10 grammes of gum-arabic in 100 parts of water, and adding thereto a few drops of aniline blue or other suitable dye. The drawing is traced upon the paper with this ink and allowed to dry. The entire surface of the paper is then covered with printers' ink, by means of a roller or stiff brush, and well equalised. After a short interval the entire sheet of paper is immersed in water, and by means of a roller, or brush, passed delicately over the surface, the ink is disengaged from the traced lines. This is facilitated by the solution of the gum. The lines are thus represented by bare white paper, and the tracing may be used as a negative. If a very opaque ground is wanted, the background of printers' ink may be intensified by brushing on bronze powder with a badger's-hair brush.

CONSTRUCTION OF ARCHES IN CONCRETE.—X.

WE must ask to be permitted to digress a little in our present article, before proceeding further with that particular part of our subject to which the attention of our readers was

FIG. 1.

directed in our issue of July 23rd last. The digression is made for the express purpose of describing and illustrating a type of the compound system which has been very much used in Switzerland, and is known as the Hennebique system. Some recent experiments have been made with this particular arrangement of steel and concrete which confirm the results already arrived at by totally independent tests, of which the details have been recorded in preceding articles. Two of these results are that the best protection from the action of fire, water; and other deteriorating agents was obtained from the employment of concrete made with artificial Portland cement, and the second that the strength of the compound system was principally due to the exceedingly strong cohesive affinity of the different materials for one another. An elevation of one example of this method of combined construction is represented in Fig. 1, in which A B is the concrete monolith, and R R the steel rods which are buried in the lower part of the mass. In order, however, to connect the upper and lower parts of the concrete beam intimately together, these rods are set in steel stirrups, s s, which, while maintaining always a vertical position, are also imbedded in the cementitious matrix. These stirrups may be placed at any reasonable distance apart, usually from 2ft. to 3ft.

The object of locating the steel rods in the lower part of the beam is to effectually carry out the indispensable proviso we have always insisted upon—that is, that the steel portion of the system should support all the tensile and other stresses of all kinds, except those of compression. In this work they are assisted by the stirrups, so that there is only a stress of the last named character to be borne by the concrete. Cohesion, homogeneity, and all the other advantages claimed by every type of this mode of building beams, arches,

and arched ribs, are assumed to belong to that of M. Hennebique; but as all these have been previously alluded to whenever deserving notice, we shall not recapitulate them. The number of steel rods needed to impart the requisite amount of tensile resistance to the concrete beam will depend upon the span of the latter, the load to be supported, and other conditions which will necessarily vary with the circumstances of each particular example. In Fig. 2, in which

FIG. 2.

a pair of rods are shown, the longitudinal section being made through the centre of the compound mass, the manner in which the stirrups s s are arranged is rendered perfectly clear. It will be seen that at the upper extremity they are bent over or cranked, so as to enable them to get a better grip of the concrete. These stirrups are placed in Fig. 1 at equal distances apart, commencing from the centre of the beam—a disposition which answers well enough when the spans of the beams are comparatively limited; but where the spans become larger a more scientific method is adopted, and they are placed closer together as they approach the points of support. As the reason for this alteration in the respective distances between the rods may not be quite apparent to some of our younger readers, a brief explanation may probably not be altogether superfluous. It should be premised that, in all horizontal—or, as they are generally termed, "straight"—solid beams of any material, as well as in all horizontal girders and trusses, supported at each end, the horizontal stresses of both compression and tension increase from the supports where they are a minimum, to the centre, where they are a maximum. But with regard to the vertical shearing stresses, the very opposite conditions obtain. Instead of having their greatest value at the centre of the beam or girder, it is at the points of support where they become a maximum. At the centre, the shearing stresses are practically equal to zero, provided, as in the present instance, the total dead load may be regarded as uniformly distributed over the whole span of the beam, girder, or truss.

At present, we are not concerned about the horizontal stresses, but with the vertical or shearing stresses, and the problem before us is to prove that these stresses, under the condition of loading already prescribed, shall be equal to zero at the centre of a beam, and attain to their maximum value at the points of support. It is an axiom in the designing and construction of beams and girders that when they are under the action of a uniformly distributed dead load, the vertical or shearing stress at any point of the

FIG. 3.

span is always equal to the total weight situated between that point and the centre of the span. Let us first investigate this statement. Let Fig. 3 represent the elevation of a solid beam or plate-girder, then, in accordance with what has been asserted, the shearing stress at any point in the line E F will be equal to the total weight distributed over that length of the girder extending from E F to the line A B marking the centre of the span, that is equal to the distance Y. Consequently, if W equal the dead load uniformly distributed per foot run, L the span of the girder, S the shearing stress at a distance equal Y from the line A B, then the assumption is that—

$$S = W \times Y.$$

It is evident, in the present instance, that the

total shearing stress S_1 has the same value at each point of support, and if we put R and R_1 to equal their reactions, we have the general equation—

$$S_1 = R = R_1.$$

But the shearing stress at E F is obviously less than that at the nearest support C, by the amount of that portion of the total load which is distributed over that length of the span extending from the line E F to C, which does not affect the value of S. In order to determine, therefore, the shearing stress at any point of the span, omitting the weight of the beam itself, or, what amounts to the same thing, including it in the total dead load, as in the question before us, it is obvious that the portion of the total load situated between the point E F and the nearest point of support, must be deducted from the shearing stress transmitted to that point of support. Calling this part of the total load W_1 , the general equation becomes—

$$S = (S_1 - W_1) \dots \dots \dots (a)$$

From the explanation given the value of S_1 may be put—

$$S_1 = \frac{W \times L}{2},$$

and that of W_1 is equal to—

$$W_1 = W \left(\frac{L}{2} - Y \right).$$

Substituting these values in equation a, we obtain—

$$S = \frac{W \times L}{2} - W \left(\frac{L}{2} - Y \right).$$

Clearing of fractions and reducing, the expression becomes—

$$S = \frac{(W - W) L + 2 W \times Y}{2},$$

from which, finally, we have—

$$S = W \times Y,$$

thus proving the truth of the axiom laid down. For the proof of the respective values of S at the abutments and at the centre, a reference to Fig. 3 will point out the maximum value of Y is when—

$$Y = \frac{L}{2},$$

that is when its length reaches from the centre of the span to either of the points of support. Its minimum value is when—

$$Y = 0,$$

that is when the point at which the shearing stress is required is situated at the centre of the span.

It is now, therefore, apparent why the stirrups are spaced closer together in the compound system under notice. They support the shearing stresses, and since these latter increase towards the points of support or abutments, the stirrups are put nearer each other, in order to increase their number, and so reduce the share of the load each would have had to support if the distance between them had remained a constant quantity. It is true that the same result could have been accomplished by increasing the dimensions of them *pari passu* with their gradual approach to the abutments. There are, however, several and weighty practical objections, well known to those engaged in the designing and construction of bridges and roofs, which forbid the use of a number of sections varying in scantling by a very small increase and decrease. Such a practice, which we regret to have frequently noticed, in introducing an unnecessary multiplicity of component parts, invariably leads to confusion. Simplicity is perfection, and the fewer the number of parts in any structure, the nearer is that ever desirable, but ever unattainable, goal approached. Those who have had experience in the erection of works abroad and in our own colonies know the great importance of "fewness, of parts." Native workmen are too lazy or too ignorant to even notice, much less concern themselves about, whether a bar 3in. by $\frac{1}{2}$ in. is put in its proper place, or another bar 3in. by $\frac{1}{2}$ in. substituted for it. So long as the length fits in, and will answer the purpose, the other dimensions are of no importance whatever. When it is borne in mind that in a "straight" lattice bridge all the diagonal bars in the open web of the girders are of exactly the same lineal dimension, the disagreement between the stresses, and the amount of sectional area provided for them, is frequently beyond all powers of adjustment.

Another method of arranging the two materials

in this combined system is represented in Fig. 4. In addition to the horizontal bars shown in Figs. 1 and 2, others are added corresponding to the thick line B B B B. The exact object of these extra bars is not very apparent. They are supposed to unite with the stirrups and the horizontal bars in resisting the shearing stresses

FIG. 4.

and also the bending moment, to which all beams and girders are liable. It should be kept in view that there is, after all, a limit to the amount of the stronger material that can be introduced into the compound system, unless the dictates of economy and the question of comparative cost are to be altogether disregarded. There is nothing easier in the world than to fortify one material at the expense of another, and the process might be continued until the weaker material was abandoned altogether, and the system reverted from a compound to a simple one. It is only by properly proportioning the respective amounts of the two or more materials of which the structure may consist that the maximum strength, together with the minimum weight is correctly, and consequently economically, arrived at. We alluded to this important part of the question in a previous article, when drawing attention to the different resisting powers of steel and concrete, and we notice with satisfaction that M. Hennebique lays a great stress upon this part of the subject.* We shall find also in the further experiments relating to larger examples of the combined system, which we shall subsequently describe and illustrate, that great consideration was paid to this important detail in both the designing and execution of the examples submitted to test.

ROYAL COURT THEATRE, LIVERPOOL.

THE disastrous fire which took place in the beginning of the year at the Court Theatre suddenly stopped the progress of the performance, and on the 21st ult. the restoration was commenced with new roofing and new ceiling. Suggestions for the removal of a blot on the theatre—namely, the want of dressing-room accommodation—have been carried out, and now, instead of general dressing-rooms, as formerly, the theatre possesses thirty-six new dressing-rooms, all built on fireproof flooring. Each dressing-room has now a window and ample ventilation. Another improvement is that each dressing-room floor has two fireproof staircases as exits for the artistes. Lavatory accommodation has been provided for these dressing-rooms, and also, it may be added, for the staff and general public.

Owing to the limited area of the rooms surrounding the theatre, it was a matter of difficulty to increase the size of the old buffet; but by the removal of a staircase the accommodation of this department has been very materially increased. The buffet and the foyer have been refitted and redecorated, principally in white and gold. The only strong colouring is in the centre of the cove over the proscenium, where is inserted the Royal Arms. In addition to the above there have been many alterations under the stage and under the pit.

A new carpenters' shop and one for the engineer, with which is incorporated a fireproof braziers' shop, have been excavated out of the rock. Adjoining them will be found a new band-room. Under the orchestra and under the pit a fine new room has been made, which can be used for general storage or an additional green-room. It has, moreover, the great advantage of forming a connection between both sides of the stage. Further, to add to the comfort of the theatre, a complete hot-water system of heating has been arranged.

Fire hydrants are provided in the pit, dressing-circle, and gallery, to be used as an additional protection for the public. For the lighting of the theatre gas has been superseded by electric-lighting wherever possible. The ventilation has not been forgotten, and the latest improvements have been adopted.

The work was commenced on June 21 last, and the theatre was completely ready for opening on Monday, Aug. 2 (Bank Holiday), for the first performance of the "Trumpet Call." Notwithstanding the extraordinary difficulties which have stood in the way of anything like rapid progress—for instance, the large mass of rock to be removed and the course of the new excavations, the impossibility of getting plasterers owing to the prolonged strike and consequent substitution of less pliable materials than plaster—the whole of the works have been completed strictly within the short time stipulated in the contract—viz., six weeks.

A shelter verandah has been designed to protect the public waiting for entrance to the theatre in Roe-street. The works have been executed by Messrs. W. Morrison and Sons, builders, of Wavertree, from the designs, and under the superintendence, of Mr. Edmund Kirby, F.R.I.B.A., architect, Liverpool.

WORK FOR THE HOLIDAYS.

ARCHITECTS desirous of a little vacation work may possibly be attracted by the very liberal advertisement we append below, and to which we give free circulation. We hope the successful competitor will not be unduly tempted to prolong his holidays on the strength of the handsome premium!

TO ARCHITECTS.
THE SKIPTON AND DISTRICT COTTAGE HOSPITAL COMMITTEE invite DESIGNS in competition for a COTTAGE HOSPITAL providing 16 beds, to be erected at Skipton, at a cost of £2,500. Premiums of £15 and £5 are offered for the designs adjudged 1st and 2nd in order of merit by the Committee. Printed particulars of the Competition, specifying in detail the requirements and conditions laid down by the Committee, with a lithographed plan of the site, may be had after Thursday, the 12th August, 1897, on application to the undersigned, enclosing fee of £1 1s., which will be returned on receipt of a set of plans. All designs are to be delivered on or before the 16th September, 1897.

W. H. DAWSON,
Hon. Sec., Skipton and District Cottage Hospital Committee.
Skipton, 6th August, 1897.

No professional referee is to be employed, apparently, and it really seems as if the committee are a little doubtful whether any architect will compete after he sees the conditions, if one may judge from the fact that a guinea has to be forwarded by each competitor.

SANITARY SPECIALITIES.

DISCONNECTION in some form is absolutely necessary to insure sanitary drainage. Messrs. Thos. Crapper and Co., sanitary engineers, of Chelsea, have long been known as the manufacturers of "The Improved Kenon Disconnecting Trap," a type of trap which serves admirably the purposes of disconnecting and cleaning. The new illustrated catalogue of Messrs. Thos. Crapper and Co.'s specialities shows a few applications of the improved "Kenon." One is a section of a disconnecting chamber, with the trap shown in position. Provision is made at top of trap for discharging into sewer any accumulation caused by accidental stoppage. There is an easy means for sweeping by a brass cap with screw, and the gunmetal valve suspended by chain is very easily lifted. By the egg-shaped section of open pipe just before it enters the trap the flow of sewage is quickened at the right point. The "Kenon" trap is made in five sizes, from 4in. to 12in., of glazed stoneware, with gunmetal valve, galvanised chain, &c. The 4in. size, suitable for ordinary houses, is only 29s. 6d.; but the plain trap itself costs only 8s. 3d. With the gunmetal cap screwed on the same size trap is priced 13s. 6d. Illustrations are given of special channel-pipes, white glazed, of different sections, and the registered white glazed block for inspection-chamber floors. This block supersedes cement channelling, and fills the space between the channel and the wall of chamber with a smooth, impervious, glazed surface. The sanitary air-tight frames and covers for manholes are a speciality of this firm. The cover, when fitted in groove, is perfectly air-tight, and can easily be removed. They are made in several sizes, painted or galvanised. Some of them are extra strong to bear heavy traffic; the "double seal air-tight frame and cover" has a double groove, and possesses great security. One of the patterns illustrated shows openings in the cover for ventilation. The automatic flush-tanks are of superior design and quality, and many patterns are shown. Several very excellent valve-closets with large slop top and dish in one piece are illustrated. These closets have white-ware flushing rim basins, slop top in one piece, and are fitted in the best

style. The "Elastic Valve," the "Twycliffe" pedestal siphon, "improved Marlboro," with lead P-trap, in white or ivory, with raised ornament, the "Deluge," and other patterns of pedestal wash-down closets are given in great variety. A superior grease-trap is shown in several patterns, also waste-water preventers of cast iron, sinks with overflows of fireclay in one piece, lavatories and baths of fireclay and cast iron. The "Independent" baths with hot and cold valves and trapped waste are capital portable goods. We recommend our readers to get Messrs. Thos. Crapper and Co.'s catalogue of special sanitary fittings before they specify goods of this description.

T-SQUARE CLUB OF PHILADELPHIA.

THE charter applied for by the T-Square Club, the leading architectural organisation of Pennsylvania, and one of the foremost in the country, has just been granted in the Courts of Philadelphia, and the club is now, therefore, duly incorporated. Although but now entering upon its corporate existence, this club has, says the *American Architect*, been an energetic organisation and a moving factor in the field of its profession for the past fourteen years, having been organised in 1883. The following well-known architects were the founders:—Walter Cope, John Stewardson, Wilson Eyre, jun., R. G. Kennedy, Lindley Johnson, Arthur Truscott, George Paxson, Charles L. Hillman, Clement Remington, Frank Price, Louis C. Baker, and Mr. Carlton. The purposes of the club, as set forth in the charter and in its constitution, are: "To promote the study and practice of architecture and the kindred arts; to afford its members opportunities for friendly competition in design; and to further the appreciation of architecture by the public." The subscribers to the charter, who constitute the present officers of the club, all of whom are well-known Philadelphia architects or draughtsmen, are: David Knickerbocker Boyd, president; Edgar V. Seeler, vice-president; George B. Page, secretary; Horace H. Burrell, treasurer; Walter Cope, Louis C. Hickman, and Charles Z. Klauder, executive committee; and Adin B. Lacey, Percy Ash, and Charles E. Oelschlager, house committee. The T-Square Club has made its influence felt in various municipal and national affairs; has passed important resolutions on progressive, local, and other matters, and last fall conducted the architectural exhibition in connection with the regular exhibition of painting and sculpture at the Pennsylvania Academy of Fine Arts. This exhibition was one of the most successful ever held there or elsewhere, being the first in America to contain so many thoroughly representative contributions from foreign architects. This autumn will again see an architectural exhibition held by this club, which, it is intended, shall surpass any previous one, both in the number and the interest of the exhibits. Representatives of the club are now in England and France securing the best drawings, and a number of exhibits are promised from other countries. The club has also sent Mr. Albert Kelsey to represent it at the International Congress of Architects to be held in Brussels, Belgium, in the latter part of this August. The Travelling Scholarship in Architecture, awarded by the University of Pennsylvania, has for the past several years been won in each case by a member of the T-Square Club. This club in 1889 was awarded the Hinkle Gold Medal for the best club display at the National Exhibit of Architectural Drawings and Sketches at Cincinnati, and in 1895 was also awarded the medal given by the St. Louis Architectural Club for the best club exhibit. The T-Square Club with the University of Pennsylvania, the Pennsylvania Academy of the Fine Arts, the Fine-Arts League, the American Institute of Architects, and other leading organisations, co-operate in all movements for the advancement of art and art matters, whether of local or national interest or benefit. The club meets once a month, and at each meeting has competitions among its members upon architectural and decorative subjects. At various times lectures are given, open to all members of the profession, and the season is occasionally marked by social entertainments. The club consists of 150 members, and numbers among its workers all the leading architects of Philadelphia. These men, by their lectures and criticisms at the meetings, give an invaluable assistance to the draughtsmen and

* *Vide* "Le Moniteur de l'Industrie et de Bâtiment."

younger members, who unite with them in an *esprit-de-corps* so essential to the advancement of this or any other profession or high object. The club, having recently removed from the School of Industrial Arts Building, is contemplating the occupation of a building in the central part of Philadelphia, which it proposes to fit up for its own uses. Here it will still further increase its usefulness and continue to widen its scope of influence. An idea of its energetic policy may be obtained by the following extract from the introduction to this year's book of programmes for the competitions:—"Our membership is large. The scope of our work and influence is extending. We have reached a position which carries with it a responsibility to the community. A high standard of design and criticism among ourselves, and an enthusiastic participation in the monthly competitions, will be not only of direct benefit to the individual members, but will enable us to take an aggressive attitude as an organisation in the struggle against bad architecture."

ARTIFICIAL STONE AND MARBLE COMPOUNDS FOR BUILDERS.

THE following formulæ give the methods of preparing some of the best-known products used as artificial stones, concretes, &c., which are open for anyone to prepare.

ARTIFICIAL STONE COMPOUNDS FOR BUILDING.

No. 1.—Ingredients: 10 parts of hydraulic lime which has fallen to a powder, with water to form a paste; 25 parts of gravel, 5 parts of coal ashes or wood ashes, water q.s. Preparation.—Thoroughly mix the mass, and add sufficient water to make the mass equal to 50 parts bulk, then pour the mass into moulds made of wooden boards and allow it to set.

No. 2.—Ingredients: 125 parts of hydraulic lime which has fallen to a powder, mix with sufficient water to form a paste; then add 250 parts of ground oyster-shells and 150 parts of ground peat ashes, and sufficient water to make the whole equal to 500 parts in bulk. Then pour into mould until set, as in No. 1.

No. 3.—Ingredients: 100 parts ground quartz sand, 2 to 10 parts finely-ground plumbic oxide, water-glass (silicate of soda) q.s. Mix the solids together, and then moisten with the water-glass until thoroughly mixed, and firmly press into moulds. When set, the stone mass thus formed should be burned.

No. 4.—Ingredients: 1 part of cement (Portland), 3 parts of sand, dilute sulphuric acid (1 part acid to 50 parts water). Preparation: Mix the sand and cement into a dough with the acid fluid, and submit to a strong pressure. Then dry the stones in the air for two days, and afterwards steep them for 12 hours in water and acid (3 of acid and 100 of water), and finally dry them.

No. 5.—Ingredients: 2 parts of Portland cement, 1 part of sand, 1 part of cinders, solution of green copperas q.s. Preparation: Dissolve the green copperas in water until no more will dissolve. Separately mix the three solids together in the dry state, and then moisten them with the solution of copperas; press the mass into moulds, and allow them to dry in a warm place for two weeks; then take the blocks out of the moulds, steep them in water for 24 hours, and finally dry for four weeks.

No. 6.—Ingredients: 10 parts unslaked lime, 3 to 4 parts of water, 40 to 60 parts of dry sand, 2½ to 10 parts of hydraulic cement. Preparation: Mix the lime with the 3 or 4 parts of water, and then mix in the sand, and finally the cement. Afterwards grind the compound, and press into moulds.

No. 7.—Ingredients: One part of alum, 15 parts of water, two parts hydraulic lime, 10 parts sand, one part cement. Preparation: Dissolve the alum well, and then add the other ingredients and work up to the required consistency; press into moulds and allow to remain for 24 hours. The blocks of stone thus prepared will not be fit for use for at least 14 days; but to be thoroughly hard requires longer drying.

No. 8.—Ingredients: 30 parts of quartz sand, 1 part of oxide of lead (plumbic oxide), 10 parts of water-glass. Preparation: Mix the sand with the oxide, and then make a dough of the mass by adding the water-glass; press into moulds, and then heat the blocks at a red heat for two hours.

No. 9.—Ingredients: 4 parts of coarse sand, 1 part of cement, gravel q.s., lime-water q.s., 2 parts of fine sand, 1 part of cement, 1 part of

dry metallic colouring matter. Preparation: Mix the sand, cement, and gravel with sufficient lime-water to form a paste; press this into moulds, and cover the surface with a composition made up of the fine sand, cement, and colouring matter. When the surface is nearly dry, brush it over with a solution of water-glass.

No. 10.—"Victoria" stone is made as follows: The refuse from the granite quarries is broken up into pieces of suitable size, and 4 parts of the fragments thus obtained are mixed with 1 of Portland cement, with the addition of sufficient water to bring the mass to the consistency of dough. The mass is run into moulds, in which it is allowed to remain for several days, or until it has set solid; the blocks are then immersed in a solution of silicate of soda.

No. 11.—Ingredients: 400 parts of sand, 52 parts of limestone, 6 parts of burnt clay (brick-dust), 13 to 25 parts of water-glass. Mix all together.

ARTIFICIAL MARBLE.

No. 1.—Ingredients: 8 parts marble-dust or white limestone, 2 parts zinc oxide, 1 part Portland cement, hot aqueous solution of water-glass q.s. Mix the three solid ingredients into a paste with the solution of water-glass (which should contain about 40 per cent. of the glass), and mould the paste under pressure while warm, and expose the moulded form for a week or ten days to warm, dry air before finishing.

No. 2.—Ingredients: 280 parts of granite or other stone, broken small; 140 parts of limestone or chalk, 5 parts of burned calamine, 3 parts of calcined feldspar, 2 parts of fluorspar, 2 parts of calcium phosphate, 40 parts of water-glass. Mix all the ingredients together in the dry state before adding the water-glass, then press the paste into moulds, and dry the finished pieces at a temperature gradually rising to 125° Fahr.

No. 3.—Ingredients: Alum, water, plaster of Paris. Preparation: Dissolve alum in water (cold) until no more alum will dissolve, and then gradually stir in dry plaster of Paris until the mixture is of a suitable consistence, then spread out the plaster in slabs or form into blocks, and bake it.

VARIEGATED MARBLE.

is produced artificially by mixing dry Portland cement with dry pigment that will colour the cement, and the mixture is made into a paste with the least possible quantity of water. Make a separate pasty compound for each colour, and then place each separate compound one on top of another, and press the compound from all sides, and beat it, so that the colours of the different parts impress themselves on each other without any uniformity, the result will be the production of veins penetrating the mass, which should then be sawn into plates or slabs, and these pressed in a mould for 12 days, during which time they should be kept moist as long as they are not entirely hardened. The polishing of each slab is proceeded with just like marble is polished.

IMITATION MARBLE

may also be produced from sandstone by impregnating the latter first with a solution of sulphate of alumina, and the next one of water-glass. The sandstone will thus acquire a marble-like appearance, and can be polished. The sandstone when so prepared can be submitted to a very great heat, until it is almost vitrified. It is likewise unaffected by atmospheric influences.

CONCRETES

for floors or pavements can be prepared thus:—Remove the soil to a depth of 2ft., and then lay in the largest stones or rubble you can obtain to the depth of 1ft., and on top of this shoot sufficient small stones—about the size of eggs—to fill up the interstices, and level the surface smooth. On top of this put a layer of coarse gravel 6in. thick, and well douse the whole with water, and let it remain some days until it has well settled. The stuff so laid in will form a solid body or foundation for the concrete, which should be prepared as follows:—Mix one barrel of good cement with 3lb. of clean sharp sand; well mix together in the dry state, and then make the mixture into a paste by sprinkling sufficient water on it, well stirring the whole. To the compound thus mixed add two barrels of stone chips and two barrels of coarse gravel, but only as much as the paste will readily combine with. Mix all thoroughly, and then tip it on the bed or foundation, and level it off to its proper height. Proceed with the laying of this deposit as quickly as possible, and

when the whole surface is covered, ram it down by the aid of a rammer, such as is used by paviors. Finish off the surface by laying on a thin layer of pure cement mortar to bring the surface to complete evenness. Do not let it dry too quickly, but wet it occasionally so that it shall have all the water it will absorb.

CONCRETE MARBLE.

No. 1.—Ingredients: Milk of lime (prepared by steeping lime in water, allowing it to settle, and pouring off the fluid, which is the "milk of lime" required), finely-powdered marble or limestones, or else chalk; a small quantity of coarsely-powdered limestone. Preparation: Mix the marble, limestone, or chalk with the milk of lime until it acquires the consistency of paste, and to give the whole more cohesion add the coarsely-powdered limestone. Lay the compound as quickly as possible, as it dries very quickly, and becomes hard.

No. 2.—Five parts coarse sand, 12 parts pebbles, 3 parts lime.

No. 3.—Sixteen parts pebbles, 8 parts river-sand, 2 parts lime. Mix with water to a suitable consistence.

SPECIAL MORTARS.

Hydraulic Mortar.—Burn some lime (CaO, calcic oxide), and then moisten the burnt lime with water and allow it to fall into a powdery condition by exposing it to the air; this powder will be calcic hydrate (Ca(OH)₂—i.e., slaked lime). Separately prepare some kieselguhr (infusorial earth or fossil meal), by washing, drying, gently heating, and pounding up any lumps that may be formed; then mix this fossil meal with the calcic hydrate in equal weights, and mix the compound with water to form a suitable working consistence. For mortars that are not much exposed to water, mix 1 part of infusorial earth with 2 parts of calcic hydrate (by weight). Another good hydraulic mortar may be made by mixing 1 part of alum shale with 2 or 3 parts of the slaked lime. The mixture is moistened with water for use, and used as mortar. It dries very quickly; becomes hard and impermeable.

A mortar for damp places may be made by using a warm solution of green vitriol (sulphate of iron or ferrous sulphate, as it is also called), with which to slake the lime, and mixing the slaked lime with very fine quartz sand.

To make ordinary mortar harden under water, add a little manganese to it.

Turkish mortar, for use in building solidly-constructed edifices, is prepared by mixing with water to the desired consistency 1 part of powdered brick and 2 parts of sifted lime. Put this on in layers of 5in. or 6in. thick between the course of brick and stone. W. C. S.

Harrow School has become the purchaser of the late Mrs. Russell Gurney's estate of thirteen acres adjoining the town, as an addition to the playing fields.

At the Grimsby Bankruptcy Court, on the 5th inst., the public examination of George Carter, joiner and builder, of No. 106, Welholme-road, Grimsby, was opened. He commenced business as a joiner eighteen years ago, and as a builder in March, 1894, with a capital of £50. He owed to unsecured creditors £1,113 3s. 3d., while his free assets were £101, leaving a deficiency of £1,012 3s. 3d. Insolvency was attributable to bad trade and losses on buildings. The examination was adjourned.

A new reservoir, constructed by the corporation of Perth, was opened on Monday at Burghmuir, two miles from Perth, by Lord Provost Dewar. The reservoir is erected at an elevation of 320ft., which is an altitude sufficient to supply all the higher districts round the outskirts of the city for many years to come. The size of the reservoir is 12½ acres by 21ft. 9in. deep. The reservoir, when full, holds 1,956,584 gallons, being 117,300 gallons more than the existing three reservoirs hold when full.

As the result of the inquiry in the House of Commons last week, the Local Government Board instructed the chairman of the Middlesex County Council to take immediate steps to have the river Brent cleaned. Mr. Littler, Q.C. (chairman of the Middlesex County Council) has conferred with the engineers of the Willesden and Ealing District Councils, who have agreed to pay half the cost of deodorising and clearing the stream of obstructions and solid pollution down to the Hanwell district. The two bodies will pay in proportion to the rateable value of their area in the Brent watershed, and the county council will bear the half of the total cost.

OBITUARY.

MR. ENOCH RIMMER, who had sat as councillor for Seabrick Ward in the Southport Town Council since 1884, and who resided in High Park-road, where he carried on business as a builder, died on Monday after a long illness. Deceased, who was a Liberal and Nonconformist, enjoyed the full confidence of his constituents, and though the Conservatives opposed his re-election every three years, he always recorded an easy victory. A native of the district, he was the spokesman in the council chamber of the modern Labour party. In the election of Sir George Pilkington as the first M.P. for the Southport Division, deceased took, in his own district, a prominent part. The building operations of deceased had extended into Birkdale, and he owned house property in various parts of the ancient parish of North Meols. He was also interested in a farm at Mawdesley.

CHIPS.

At Batley, new Roman Catholic schools, built from designs by Mr. J. Burrows, architect, have just been opened by the Bishop of Leeds:

The master builders of Stirling had their annual trip on Thursday in last week, the place visited being Millport. The company, which numbered 60, left by train at 8.35 in two saloon carriages, and Millport was reached at 12.30. The excursionists drove round the island in brakes, and afterwards dined at the Cumbrae Hotel. Councillor John Govan presided, and Mr. R. Frater was croupier.

An electric tramway from Kirkstall Abbey to Roundhay Park, Leeds, was inaugurated on Thursday in last week by the Lord Mayor of Leeds. At the ensuing luncheon, the chairman of the highways committee of the Leeds City Council stated that since August, 1896, the committee had relaid 17½ miles of permanent way; it had also laid 4½ miles of extensions. At the present time they had about 1,000 men at work on other branches relaying and bonding the rails, with a view to electrical extensions in the future.

The technical education board of the London County Council invite applications for the appointment of headmaster of the new Camberwell School of Arts and Crafts. The salary will be at the rate of £400 a year. Full particulars of the duties and conditions of the appointment may be obtained during August of Dr. W. Garnett, secretary of the board, 9A, St. Martin's-place, W.C.

The new church of St. Luke at Maidstone will be opened on Friday, September 3. It is Late Perpendicular in style, is built of local ragstone, with Monk's Park stone dressings, and is seated for 600 persons. Mr. W. H. Seth-Smith, of Lincoln's Inn-fields, is the architect, and the builders are Messrs. Wallis and Sons, of Maidstone.

Tenders for the demolition of the Palace of the Liberal Arts, in Paris, one of the buildings erected for the International Exhibition of 1889, have been received. The reserve price was 158,000fr., but the successful bidder agreed to give 308,000fr. for the materials, to be removed, of course, at his own expense.

The parish church of Thirst, which was restored internally about eighteen years ago, is about to be repaired externally at a cost of about £1,250. Mr. C. Hodgson Fowler, F.S.A., of Durham, is the architect, and the work was commenced last week.

A hall is being built at Guardbridge, Fifeshire, from plans by Messrs. Gillespie and Scott, St. Andrews. The building is to be of brick and freestone, and is in the English Renaissance style. It will accommodate over 300, and is lighted by large windows at the sides and ends. The roof is to be half-open, showing the timbers. There will be a platform suitable for theatricals on a small scale, and two ante-rooms. The contractors are:—Messrs. Linder, bricklayers, St. Andrew's; Alex. Smith, joiner, Cupar; Rintoul and Mackie, slaters, St. Andrew's; Alex. M'Ritchie, plasterer, Dundee; and Alex. Stewart, plumber, Cupar.

At a recent meeting of the Cheltenham Town Improvement Committee, the tenders for the Winter Garden scheme were considered. Eight were sent in, and it was resolved to recommend the town council to accept that of Messrs. A. Estcourt and Son, of Gloucester, at £46,600. The separate items in this tender (which was the lowest received) are: municipal buildings, £21,019; kursaal, 21,341; winter garden and accessories, £4,240; total, £46,600. The town council received this report last week, and adopted it after a long discussion. A proposal to divide the work between two builders of Cheltenham, and to accept the tender of Messrs. Billing at £22,199 for the municipal buildings, and those of Messrs. Collins and Godfrey at £21,540 for the kursaal, and £4,400 for the winter gardens, was rejected by eleven votes to six.

Building Intelligence.

BRIXTON, S.W.—The foundation-stone of the new parochial hall for Christ Church, North Brixton, was recently laid by Sir George Williams. The existing church, a pseudo-Classic structure, is very dilapidated, and occupies a cramped area, and it was, therefore, decided to rebuild the church upon the present site, enlarged by acquiring 96, Brixton-road, and 1 and 3, Chapel-street. The leasehold interests of those properties have been purchased, and the Ecclesiastical Commissioners, who are the freeholders, have agreed to grant free of cost the freehold. The enlarged site thus secured has a frontage of 116ft. to Brixton-road, by an average depth of 235ft. The designs of the new church, which have been prepared by Mr. Beresford Pite, F.R.I.B.A., provide a building accommodating a congregation of 1,500 persons, two-thirds of whom will be placed on the ground floor and one-third in the galleries. A large hall will be built upon the rear portion of the site before the present church is pulled down, in order to provide temporary accommodation for the congregation during the erection of the new building. On the completion of the new church the hall, which is intended to be a permanent structure, will be capable of easy conversion into a parochial hall and infant school, with rooms and other accommodation for Bible classes and small meetings. The cost of the new church, including furniture, heating, and lighting, is estimated at £15,000, and the hall at £2,800, and towards these sums £5,000 has been promised.

DUNFERMLINE.—The pended tower formerly connecting the Abbey of Dunfermline with the Palace, which has been converted into a museum, was formally opened on Friday by Mr. Andrew Carnegie. The tower, which is a massive oblong building situated at the south-west corner of the Abbey grounds, and crossing the roadway, was until recently used as a sexton's toolhouse, but through the generosity of Mr. Carnegie it has been transformed into a home for antiquities connected with Dunfermline and neighbourhood. The work of renovating the building has been carried out under the direction of her Majesty's Office of Works, the plans being prepared by Mr. Hawks, who also undertook the superintendence of the tradesmen. The alterations which it was necessary to make have been of such a character as to retain the whole building in harmony with its surroundings. There are in all four rooms of different sizes and shapes. The windows have been filled in with cathedral glass, and in the principal apartment the Scottish standard and the Dunfermline burgh arms appear in the eastern and western lights respectively, while Mr. Carnegie's monogram is shown in another.

REDLAND, BRISTOL.—The new church of St. Anselm, which has been erected in Whatley-road, Redland, as a chapel of ease to St. John's, was opened on Sunday. The church, which is from the designs of Mr. W. V. Gough, architect, Bristol, will ultimately consist of tower, nave, chancel, transepts, and aisles, and will hold about 700 worshippers; but all that has been done at present are the nave and chancel, which afford accommodation for about 400. The south aisle will for present purposes be separated from the church, and will do duty for vestry and classrooms, which eventually will be provided underneath the north aisle. The architecture is Early Decorated. The walls are built of pink stone taken from the site, with dressings of Bath stone. The seating is by means of chairs provided by Messrs. T. Miles and Co., of Badminton-causeway. Mr. E. Walters, of Montpelier, Bristol, was the builder.

In the peristyle of a house at Pompeii recently excavated two fine wall paintings have been found, probably transferred there from some other building. One of them represents a poetess reading to a female musician; the other a young girl leaning against a pillar, and conversing with a girl seated and wrapped in a large mantle.

One of the projects which have obtained Parliamentary sanction during the session just ended is the Deane Valley Railway Bill, a measure providing for a line in the West Riding, about 17½ miles in length, forming junctions with the Hull and Barnsley Railway, near Barnsley, and with the Great Northern and Great Eastern Railways, at Blackcarr, near Doncaster, and for a small dock in the river Deane, at Mexborough.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—The members of this association have just returned from their annual sketching expedition, which is arranged to provide students with opportunities for studying examples of ancient and modern architecture which may be of service to them. One day was devoted to a careful study of Tewkesbury Abbey, whilst the noteworthy churches and domestic buildings in the district of Bredon, Pershore, and Upton-on-Severn were inspected during two days. The fourth and last day was devoted to Forthampton Court.

THE ROYAL ARCHÆOLOGICAL INSTITUTE.—The annual summer meeting of this institute terminated at Dorchester on Tuesday with visits to Milton Abbey and other features of interest in the district. Lord Dillon, president of the institute, was present, and took an active part in the proceedings. At the annual business meeting, which was held at Dorchester, Lord Dillon and the whole of the other officers of the institute were re-elected. The success of the summer meeting has been largely contributed to by the local committee, with Mr. H. J. Moule as hon. secretary. On Wednesday the institute went to Jersey, where they had an extra day under the guidance of the Société Jersaise.

The Cwm Baptist Chapel at Charistoke having become dilapidated, is being rebuilt from the ground. Messrs. Davies and Son, of Newtown, Mont., are the contractors. The foundation-stone of the new building was laid last week.

The Mont Blanc Mountain Railway is in swift progress. The works along the Arve from Le Fayet to Chamounix will soon be completed, and then they will proceed with the actual mountain railway from Chamounix (3,400ft. across Montanvert, 6,250ft.) to the Mer de Glace. The length of this mountain line will be 5½ kilometres, and the ascent will amount to about 900 metres. The first half of the climb of the railway carriages will be effected by the adhesion system, the other half by the cogwheel system, as on the two Rigi railways. It is anticipated that the railway to the Mer de Glace will be completed in the year 1900.

A new carbon factory for the purpose of preparing carbon in connection with the electric furnace of the British Aluminium Company's works at the Falls of Foyers, and for other minor purposes, was opened in Baker-street, Greenock, by Lord Kelvin on Friday. The factory is the first of the kind in the United Kingdom. The raw material used in it is retort carbon, a by-product of the gasworks, and it is obtained from the gasworks in Glasgow and other towns. The principal features of the process are the great pressure at which the carbons are moulded by powerful hydraulic machinery and a unique annealing furnace heated by producer gas. The power required for the process is supplied by the Greenock Water Trust through the existing conduit.

At the last meeting of the Mold Urban District Council a communication was read from Mr. Isaac Jones, the council's surveyor, resigning his position on account of advancing years. He had been 24 years in the service of the town, and he thanked the members for the kindness they had extended towards him. The chairman and other members testified to the faithful and conscientious services of Mr. Jones. It was decided to refer the question of appointing a successor to the finance committee, and to recommend the committee to consider suggestions which had been thrown out as to assisting Mr. Jones in his declining years.

An additional factory has just been completed for Messrs. James Taddy and Co., tobacco manufacturers, in the Minories, E.C. The architect is Mr. Edwin J. Sadgrove, of 22, Surrey-street, Strand, and the builder, Mr. T. E. Mitchell, of 136, Hampstead-road. It is five stories in height, and is faced with red bricks, Portland stone being liberally used for dressings. Mr. George Jennings, of Lambeth, executed the sanitary work.

The municipal corporation of Aberdeen has resolved, on the initiative of Town Councillor Boddie, to erect in Duthie Park a granite monument in commemoration of the generosity of the late Miss Duthie, the donor of the park to the community of that city. The monument will be constructed of Aberdeenshire granite, and will be 23½ft. high. At each of the four corners of the base will be carved a lion couchant. On the base stands a die for inscriptions, from which will rise a fluted column, with Corinthian capital, after the style of that in the Temple of Vesta, Tripoli, but adjusted to suit work in granite. The monument will be crowned by a figure of "Hygieia," typical of health. The design is by Mr. Arthur Taylor, sculptor, Aberdeen, and the total cost will be £400.

Engineering Notes.

CRYSTAL PALACE SCHOOL OF ENGINEERING.—The award of the certificates to the students of this school took place on Friday at the Crystal Palace. Mr. G. A. Goodwin, past president of the Society of Engineers, occupied the chair. Mr. R. G. Hodson, superintendent of the school, read the examiners' report for the summer term of 1897, which is the second term of the 25th year of the school. Mr. R. J. Money, who examined in the mechanical section, noted the continued improvement shown in the work turned out since he was a student 17 years ago, and since he examined the section six years ago. Mr. A. Marshall congratulated both the students and instructors on the result of the work in civil engineering. Mr. J. G. Aldridge, reporting on the electrical section, especially commended the work of Mr. Harbord. Mr. Goodwin then presented the certificates. Mr. W. Sims was first in the mechanical engineering section (first year's course); Mr. B. O'Dowda, in drawing; Mr. F. Peach, in pattern-work; and Mr. W. J. Wood, in fitting-work. In civil engineering in the second year's course, the most successful students were Mr. O. A. St. John-Kneller, Mr. J. W. Simpson, Mr. J. M. Alvares, and Mr. R. F. Arkwright. In the electrical section, Mr. W. T. Harbord and Mr. A. T. Araujo took first places.

RIVER WEAVER IMPROVEMENTS.—The River Weaver Trustees have just commenced an undertaking which is intended, by an expenditure of £35,000, to greatly improve the waterway. The work includes the erection of two swing bridges worked by electricity, the making of new roads, and the removal of obstructive locks. One swing bridge will replace the fixed bridge at Northwich on the high road between Manchester and Chester. This structure is constantly sinking, and though it has been raised as high as the gradients of the road permit, salt craft returning light to Winsford have been unable to pass beneath. In order that road traffic shall not be unduly interrupted, an alternative swing bridge and road are being made 400 or 500 yards distant. As the land in the neighbourhood of both is subject to subsidence, the weight of the bridges will rest on pontoons, which will not be affected by any difference in the levels of the river in times of flood or drought. The town's gas and water will be carried under the river by a duplicate set of pipes placed in siphons. By the removal of the New-bridge Locks, two miles below Winsford, the water level will be raised, thus enabling larger craft to navigate the river and to carry greater cargoes to Liverpool and Manchester. The order for the construction of the bridges, apart from electrical connections, &c., has been placed in the hands of Messrs. A. Handyside and Co., Limited, of Derby, the contract being £16,687. Messrs. Beckett, of Hartford, are making roads at a cost of £3,018, while the remainder of the work will be carried out by the Trustees' own employees.

The Burnley Corporation have decided to seek further borrowing power for £10,000 for sewage purposes. Of this £7,452 is required for the amount overspent on Gannow and Altham sewer and the Wood End sewage farm, £1,000 for an artificial filter now in course of construction, and £1,547 for additional filters at Wood End.

The Glasgow corporation have accepted a bequest from Mrs. M'Kerracher of four pictures by the late Sam Bough, viz., "Cadzow Forest, 1855," "Dutch Luggers entering the Thames," "By the Lake, Cumberland," and "In Glen Sannox," and also a portrait of the testator's father. The works have been hung on a screen in the Corporation Art Gallery.

A memorial window to the late Jesse Simcox and family has been placed in the south chapel of St. James's Church, Handsworth, with figures of Zacharias and Elisabeth, with the angel Gabriel in the tracery announcing the promised child. The window was from the studio of Mr. T. W. Camm, Smethwick, near Birmingham.

The corporation of Liverpool have agreed to pay £95,000, in accordance with the provisions of the City Churches Act, for the land on which stand the churches of St. John and St. George, which are to be closed in March next year.

The official opening of the Lady Windsor deep-lock at Barry Dock will take place in September. The new lock admits vessels up to 9,000 tons burden, and has been constructed by Sir J. Jackson, of Westminster.

COMPETITIONS.

BOOTLE.—In response to the advertisements of the Bootle Corporation inviting competitive plans for a technical school to be erected at the corner of Balliol-road and Pembroke-road, at a cost not exceeding £15,000, and offering premiums of 50, 30, and 20 guineas for the three best designs, there have been received 22 sets of plans. Mr. W. E. Willink, president of the Liverpool Architectural Society, has been appointed by the Free Library and Museum Committee to act as referee to advise them in the consideration of the plans. There were 40 applications to the borough engineer for a plan of the site and instructions, and the committee has resolved that the guinea deposits of those architects who failed to compete be not returned.

LICHFIELD, STAFFS.—Applications were received from 27 architects to advise the guardians upon the proposed alterations and extensions to the workhouse. Mr. W. H. Woodroffe, A.R.I.B.A., London, was appointed. The workhouse, which is situated in the Trent Valley-road, was erected in 1840, and was designed by Sir Gilbert Scott. It is of picturesque appearance in red brick and stone, and small windows with iron diamond-shaped casements, which for a workhouse are not conducive to healthy rooms, and though of quaint appearance, are to be removed.

CHIPS.

An Hotel Victoria is about to be erected at the eastern end of Newquay, not far from the station, from designs by Mr. John Sansom, of Liskeard. It is proposed to expend about £20,000 on the building and its equipment, a feature of the undertaking being a subway from the hotel under the cliffs to the sea-beach, reached by the passenger lift in the hotel.

The Holywell Board of Guardians are about to erect a cottage home in the field at the rear of the workhouse for the accommodation of the children. The plans have been prepared by Mr. Bibby, architect, Flint, and the contractor is Mr. Sibson, Holywell. The cost of the home will be about £1,200.

The Local Government Board have written to the town clerk of Scarborough stating that they are prepared to sanction the borrowing of the sum of £16,100 for the purchase of property comprised in the Harcourt-place improvement, which is to give better means of inter-communication between Huntriss-row and St. Nicholas Cliff.

Ground-rents amounting to £2,500 a year, secured upon blocks B, C, and D, Bedford Court Mansions, Bedford-square, have been disposed of for £82,000.

The foundation-stone of National Schools, which are being built in connection with the Radcliffe parish church, was laid on Saturday afternoon with full Masonic ceremonial. The school will cost between £2,000 and £3,000.

A new theatre is in course of erection in the High-street, Chatham, and will be opened at Christmas time. Mr. Frank Matcham, of London, is the architect.

The Duke of Connaught laid, on Saturday, the foundation-stone of two blocks of wards, each of two floors and providing 80 beds, which are being added to the hospital at Portsmouth as a Diamond Jubilee Memorial. Messrs. Young and Hill, of Bloomsbury, are the architects, and the lowest tender, that sent in by Mr. J. H. Corke, of Portsmouth, has been accepted at £19,293 for the execution of the work.

As a memorial to the late Lord Lilford, there have been erected at the church of Thorpe Achurch a stained-glass east window, and two smaller windows at the west end; they were dedicated last week by the Dean of Peterborough. The artists were Messrs. Powell, Whitefriars, London. In the centre light of the east window is a representation of the Good Shepherd, and on each side are adoring angels, with texts of Scripture in the designs above, and the smaller windows show two angels bearing scrolls, containing the first verse of the 92nd Psalm. A lych-gate is also being erected by Clementina Lady Lilford.

The town council of Helston, West Cornwall, and the committee of the Passmore Edwards Science and Art Schools in that town, have unanimously accepted the tender of Messrs. Symons and Son (contractors for the schools) for building the retaining and other boundary walls around the premises, and also the approaches thereto.

The Leeds City Council have authority from the Markets Committee to build a wholesale dead meat market and abattoir on a portion of the market estate bounded by York-street, Harper-street, and Sykes-place, at an estimated cost of £24,000, and to offer such premiums as they may think reasonable for the preparation of plans and estimates.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of: the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant," or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXI. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

* * In response to complaints from readers that they are unable to get the BUILDING NEWS at Messrs. W. H. Smith and Son's bookstalls, we can only suggest that they should order the paper of some other newsagent. Messrs. W. H. Smith and Son recently requested us to allow them an extra discount beyond that allowed to the general trade, and because we declined they have ceased to send the paper out to their bookstalls. We have, of course, no remedy; but we do not think the demand was a fair one.

RECEIVED.—W. R. and Son.—L. L.—C. S. G. A.—M. B. and Co.—D. H. A.—F. N. P.

Correspondence.

"THE PASSION" AT STRALSUND.

To the Editor of the BUILDING NEWS.

SIR,—I have for some time had in my possession a plate, published by you in the BUILDING NEWS for Jan. 22, 1892, which, according to its title, purports to represent certain "Woodcarvings of 'The Passion,' Stalshund Church, Black Forest, from photos. by Dr. T. R. Allinson, L.R.O.P." Now this plate has for a long time been a great puzzle to me. Stalshund I have been unable to find in any guide-book or geographical index of any kind. One thought, naturally, of Stralsund on the Baltic; but the expression, "Black Forest," seemed to preclude the possibility of that being the place referred to. I may add that there was nothing in the letterpress of the number in question to throw any light at all upon the matter.

I had long dismissed the subject from my mind, when, in the course of last month, I happened to be myself at Stralsund, and looking at a fine old altar-piece in the Nicolai Kirche of that town, I was suddenly and irresistibly reminded of the plate, and was convinced that what I was then looking at was the real original of it. And in this view I only became the more convinced when, on my return to this place, I compared the plate in question with the photo. I had secured at Stralsund of the woodcarving there.

There may still be some to whom (as so long formerly to myself) this plate and its description still constitutes an inexplicable puzzle, and who may be interested to hear the result of my late experience.—I am, &c.,

New Southgate, N. B. H. CHAMBERS.

CHIPS.

The foundation-stone of a new board school at the Camp, St. Alban's, was laid last week. The architect is Mr. F. W. Kinner Tarte, M.S.A., of that city.

At Rusthall, near Tunbridge Wells, a village club-house is being built at a cost of about £1,100. Mr. E. Cronk is the architect.

On Friday morning, the first shovel of cement was turned over in connection with the new fishermen's harbour at Berwick-on-Tweed, and the work will now proceed apace. There were present Mr. Moncrieff, Newcastle, representing the architects, and Mr. McDonald, Hawick, contractor. Peter Young, one of the oldest fishermen, used the shovel.

The Colwyn Bay Urban District Council have approved this week plans submitted by Mr. Horton, and recently selected in competition, for laying-out and sewerage the estate known as Rhos-on-Sea.

The new church of St. Matthew at Douglas, Isle-of-Man, was opened on Tuesday. It has been built from plans by Mr. J. L. Pearson, R.A., at a cost of £5,000, and replaces an edifice bearing the same dedication, consecrated in 1708 by Bishop Wilson. The old church is to be pulled down.

The high bailliff of Peel formally opened, on Friday, a new open-air bathing-place, which has been constructed at the creek known as Traie Fogog, near Peel. The construction includes a bath 140ft. long by 75ft. wide, and holding 270,000 gallons of sea-water, and also dressing-boxes and other accommodation for bathers.

On Saturday, a co-operative hall seating 700 people, together with reading-rooms, library, amusement-room, &c., in connection with the Burnopfield Stores, Co. Durham, were formally opened. The premises have cost about £3,000.

Major-General H. Darley Crozier, R.E., held, on behalf of the Local Government Board, an inquiry at Liverpool on Wednesday, concerning a proposal of the corporation to borrow £100,000 for the purposes of electric lighting, and £8,000 for those of parks and pleasure grounds.

The Bishop of London, on Thursday in last week, consecrated a new church, dedicated to St. Peter, which has been erected at Lower Edmonton. The building, which has cost £3,800, will seat 520 people.

Good progress is being made with the new marine promenade and drive at Scarborough. Mr. J. E. Everett, the resident engineer for the construction of the works, states that since his last report 208 concrete blocks have been made, containing 221 cubic yards of concrete. The foundation of the seawall for a length of 96ft. is complete, and a length of 54ft. has been carried up 4ft. above the level and backed up with concrete. The excavations and foundations, and the setting of blocks and backing them with concrete is now being carried on simultaneously, independently of the men who are making the blocks. The gang of men employed on the Castle Cliff are making good progress in sloping it down to a safe angle.

At a meeting of the special tramways committee of the Liverpool Corporation held on Monday, a proposal to elect Mr. Pearson as engineer for the new electric tramway was defeated by seven votes to five. Sir A. Forwood then resigned the chairmanship of the committee, and the further consideration of the engineership was deferred. Mr. Pearson is an American, and the feeling of the majority was that the work could be done by an English engineer or some one of the corporation's own staff.

The memorial stone of a new church for the Congregationalists was laid yesterday at the junction of Farrer and Crookes-streets, Barnsley. A site of 1,600 square yards has been acquired, and plans for a church and school, to cost £2,500, have been prepared by Messrs. Hensoll and Paterson, Sheffield. At present the chapel is being built at a cost of £1,300.

The report of Lt.-Col. Samuel M. Mansfield, Corps of Engineers, U.S.A., on Boston Harbour, states that the expenditures for the improvement of the harbour and the streams that empty into it have been nearly three millions of dollars. Last year the work on the main channel was carried on, and a width of 350ft. of the 27ft. channel has been cleared of ledges. At present the main ship channel is 27ft. deep at low water, 1,000ft. wide from the entrance to Bug light, 800ft. wide thence to the passage between George and Gallop's islands, and thence 550ft. wide through the remainder of the narrows.

Intercommunication.

QUESTIONS.

[11736].—**Defective Materials.**—I shall be obliged if any of your correspondents can inform me of any cases recently decided in which an architect has been sued for damages by the building owner for allowing (knowingly or otherwise) the introduction of defective materials or workmanship, and where such cases are reported?—LEX.

[11737].—**Construction of Subways.**—Which is the most recent subway? I should like to be informed of the mode of construction of any recent railway or tunnel. Whether brick or concrete is found the best material for the crown, the proportion of concrete, thickness of side walls and invert, and what precautions have been taken to prevent the percolation of water. I believe a coating of asphalt has been found a good coating. The dimensions of subway are important. Is there any work on the subject?—YOUNG ENGINEER.

[11738].—**Asbestos.**—Will anyone who has used this material as a plaster or covering inform querist where he may obtain information as to its use in plastering walls and ceilings, and oblige—A CONSTANT READER?

[11739].—**A Disconnecting Trap.**—I want to know of a good trap that can be used, which can be cleaned, for a house of moderate size, and the price for a 6in. drain.—A. C.

REPLIES.

[11714].—**Stone Measurement.**—To "READER."—I have to acknowledge and thank you for your answer in last week's BUILDING NEWS; but, as I read it, the second part of your reply contradicts the first. As the millions were out on the job out of blocks of stone in section of fours, as shown on my sketch, which part of your reply am I to take refers to them, and which we shall pay on?—T. M. GARROOD.

[11728].—**Strain of Girder.**—In reply to "J. C." I shall assume the girder to be uniformly loaded along the top, and the loading to be referred, in the usual way, to the joints; so that the weight along any bay will be borne equally by the two joints at the end of that bay. Thus, if w be the load on each bay, there will be a load w on each joint along the top, except on the end joints, and on each of these there will be $\frac{w}{2}$. A depth of about

1-12 span has been found economical for girders, and will be here adopted. In lattice girders of small span the

depth is, in general, the same throughout, and the diagonal bars all alike, and inclined at the same angle. When this is the case, we need only to calculate the section necessary to bear the maximum stress for each kind of member. The strains may be worked out graphically, as shown in Figs. 1 (a), 1 (b). The method is explained with reference to trusses of other forms in "Graphic Statics," Chaps. V., VI., VII., Nos. 2185, 2189, 2193. Fig. 1 (a) shows the centre-lines of the various members of the girder. In our calculations each boom is treated as if it were made up of parts jointed together at the ends of the bays, so that the resistance of the boom to bending is not taken into account, only the direct, and not the bending stresses being dealt with. In Fig. 1 (b), ah is drawn to represent a total load of 13 tons; $ab, bc, cd, de, ef, fg, gh$ represent the loads on the joints of top boom. The supporting resistances (HK, KA in Fig. 1, a) will be vertical, and are represented by hk, ka , each equal to $\frac{1}{2}$ tons. To understand Fig. 1 (b), all that is necessary is to observe that the figure is made up of the polygons of the forces which act at the various points of Fig. 1 (a), and that, therefore, the strain on any member in Fig. 1 (b) is given in Fig. 1 (b) by the line which has at its extremities the letters which correspond to those which occupy the spaces which the bar separates in Fig. 1 (a). The direction of the force in any bar will enable us to distinguish members in compression from those in tension. In a truss such as that under consideration, and loaded symmetrically, each diagonal bar which points upwards towards the centre will be in compression, and the others in tension. If it be desired to calculate arithmetically the various stresses, observe that each diagonal bar has to bear all the weight between its point of support and the centre of the girder; the stress in the bar, then, will be found by multiplying this weight by the fraction $\frac{\text{length of bar}}{\text{depth of girder}}$; that is, by

the cosecant of the inclination of the bar to the horizon. The stress along any bay in one boom may be easily found by taking moments round the opposite joint in the other boom. Want of space forbids a detailed description of

all these methods. Maximum stress on lower boom (tension) = 19½ tons. Taking 5 tons to the square inch as a safe stress in tension gives 3·9sq.in. as the required effective sectional area (that is, after deducting loss by rivet-holes) of the tension boom. For the compression boom, we have—

Max. stress = $18\frac{1}{2}$ tons = 18·42 tons.

Sectional area = $\frac{18·42}{4}$ sq.in. = 4·6sq.in.

For braces, max. stress = about 7·6 tons. This requires $\frac{7·6}{5}$, or 1·5sq.in. effective sectional area for the tension

braces, and $\frac{7·6}{4}$, or 1·9sq.in. sectional area for braces

in compression. It is evident that a single bolt would have to be inconveniently large to join the braces and booms; it will be better to use rivets. Let us assume that the braces are to be of angle-iron $\frac{3}{4}$ in. thick, and that the rivets are to be $\frac{3}{4}$ in. diameter, and so arranged that there is a loss of only one rivet-hole in the section of the brace. Then $\frac{3}{4}$ in. by $\frac{3}{4}$ in. by $\frac{3}{4}$ in. angle-iron will do for the tension braces, giving a slight excess of strength. Supposing the riveting to be properly done, there is no need to deduct for rivet-holes in a section which is in compression, since, the hole being filled up, the strength for resisting compression is not reduced. Hence, $\frac{3}{4}$ in. by $\frac{3}{4}$ in. by $\frac{3}{4}$ in. gives sufficient area for the compression braces. These ought to be tested for stiffness as well as for mere strength to resist compression (see Gordon's formula). As for the number of rivets necessary at junction of brace and boom, it is common to take the rivet area as equal to the effective sectional area of the bar; the number of rivets then will be—

sectional area of bar = $\frac{1·9sq.in.}{4}$ = 4·3.

sectional area of rivet = $\frac{1·9sq.in.}{4}$ = 4·3.

We see, then, that 5 rivets will do, and that they may be arranged as shown in the rough sketch, Fig. 2. This arrangement reduces the sectional area of the booms by two holes at some places. 5in. by 5in. by $\frac{3}{4}$ in. T-iron will serve for both booms. The above working can be modified to meet altered conditions. It is hoped that the explanations will be found sufficient. NOTE.—If there is more than one system of triangulation, the stresses above found for the braces may be divided by the number of such triangulations.—J. C. PALMER.

[11726].—**Strain of Girder.**—Obtain the treatises published by Professor Adams, which will give all particulars. The subject has been treated over and over again in the "B.N."—A. L.

[11727].—**Roofs.**—"A. D. W." may find graphic methods for working out the strains on each particular member of roof trusses of various forms in the chapter of "Graphic Statics" referred to in the answer to "J. C." The same method is applicable to lattice girders, as will appear in later chapters of "Graphic Statics."—J. C. PALMER.

[11728].—**Legal.**—To question 1, yes; 2, a right of support of a building by land may be implied by a long and uninterrupted enjoyment. There is a legal phrase which states that one plot of land is entitled to have his land supported by the adjoining land as a right of property, and if this is interfered with the adjoining owner is liable. Any act which deprives the next owner of support is wrongful, and the person injured may claim damage. An important limit, however, has been made by which the owner of a building is not entitled to the lateral support of his neighbour's land if his house has been erected within 20 years. One case—"Smith v. Thackeragh"—lays this down. Here it was ruled that the right of an owner to lateral support of his neighbour's land is not an absolute right, and the infringement of it is not a cause of action without appreciable damage. A dug well near B's land, which sunk in consequence, and a building on it within 20 years fell, and it was proved that if the building had not been there, it still would have sunk. Held that B. had no cause of action. In "Dalton v. Angus" it has been decided that a right to lateral support may be acquired by 20 years' uninterrupted enjoyment for a building proved to have been newly built or altered.—A. J.

[11731].—**Specifications.**—The specifications published by Mr. Leaning, and given in a series of articles in this journal, and those recently published in the "B.N.," "Adaptable Specifications," will no doubt suit "Young Architect's" requirements.—G. H. G.

[11732].—**Strains on Structures.**—Several very useful handbooks have appeared. Those by Tarn and Campin, and the series of articles in the BUILDING NEWS, "Graphic Statics" (last volume), also "Strains on Structures," by Middleton, are recommended.—OLD STUDENT.

[11733].—**Glazed Roofing.**—"Conservatory" cannot do better than adopt Rendle's "Invincible" glass roofing. Apply, 5, Victoria-street, Westminster, for details and information. This system allows for expansion, and gives ample security against the entrance of rain.—G. H. G.

[11735].—**Sawing Stone.**—There is one obvious reply to this query of "Perplexed." If his "man" cannot go down square, why does he not get someone who can? He must know whether he can. He can easily put guides at each end of the stone, and let the saw run through them. The guides might be fixed to a framing on which the stone rests whilst being sawed square.—D.

[11735].—**Sawing Stone.**—This is a very simple matter, and the ordinary labourer in a stonemason's yard can easily accomplish it. No iron or steel plates are necessary to keep the saw-frame in line, which, I presume, is framed up in the usual manner, and must be suspended from a pole, with weights to balance it. A vertical V chise is cut in at each end of the stone to be sawn, for guidance, and the saw worked backward and forward, care being taken to saw direct down the line. Purchase's "Practical Masonry" gives a good description of the saw-frame, with illustrations and methods of working.—F. C. C.

Lady Shelley has offered the Bournemouth Town Council six acres of cliff and foreshore at Boscombe. The gift is under consideration.

For description and further illustrations see pp. 212-13.

GIRLS' SCHOOL AT ROEDEAN, NEAR BRIGHTON.

THIS new school, which we illustrate by a bird's-eye perspective and sketch-plan, is being built at Roedean, half-way between Brighton and Rottingdean, for the Misses Lawrence, of the former town, as a preparatory institution to Newnham College. The site, of some 18 or 20 acres, is an exceptionally difficult one, being a portion of the steep chalky slope of one of the Downs; but it overlooks the sea and faces due south. Opportunity, therefore, was taken to utilise the aspect to the full in the disposition of the buildings. A winding carriage-way has been carried up from the Brighton and Newhaven main road, ending in a terrace 40ft. wide in front of the open quadrangle, around which the buildings are grouped. The premises extend some 480ft. from east to west, with an extreme depth in the centre of 225ft. To the east and west of the quadrangle are four blocks of boarding-houses, each under the control of a mistress; the front portions are devoted to administrative purposes, and behind are bedroom wings, running hospital fashion north and south, so that every window has the direct sunlight at some period of the day. There are neither dormitories nor cubicles, but each girl has a separate bedroom, independently lighted, warmed, and ventilated. In the centre, looking down the quadrangle upon the sea, is the school-house, with central clock-tower and broad oriel over a main entrance, and having on either side a lofty tower containing the water-tanks. Behind this building, and running north and south, is the great hall, with detached music wing, containing professors' apartments and sound-proof rooms for practising. The buildings are carried out in local stock bricks covered with roughcast, the plinths and chimneys being of red bricks, and the copings, sills, &c., of Monk's Park Bath stone; the roofs are covered with Broseley tiles. The style adopted is a simple treatment of Early Seventeenth-Century Renaissance. The architect is Mr. John William Simpson, A.R.I.B.A., of 10, New Inn, Strand, W.C.; the builders are Messrs. Peters and Son, of Horsham; and the clerk of works is Mr. T. Bush Sage. Mr. J. Jeffreys, of Old Queen-street, Westminster, is the engineer for ventilation, heating, and water-supply, and Mr. J. Rogers-Field, B.A., is carrying out the sanitary arrangements. The total

outlay will be between £60,000 and £70,000. The buildings are now nearly half-way up, and the memorial stone was formally laid by Mrs. Sidgwick, of Newnham College, on the 26th ult.

CHELSEA INFIRMARY: NURSES' HOME AND DOCTOR'S HOUSE.

THE building is situated at the corner of Sydney-street and Cale-street, Chelsea, and has a frontage of 69ft. to the former street and 77ft. to the latter; the approach to same is from the principal open space of the adjoining infirmary building. The medical officer's house occupies the south-east corner of the site, and is self-contained upon four floors, two floors of the nurses' home being above same. The nurses' home consists of six stories; the lower ground-floor is devoted to large recreation-room, linen and box rooms, small kitchen, bath, lavatories, &c. The nurses' bedrooms, of which there are 55, are placed upon the five upper floors. The average size of the rooms is 13ft. by 9ft. by 10ft. high; those on the top floor are set apart for night nurses. A sitting and tea-room, for the use of night nurses, is provided on the third floor, in connection with which is a small kitchen. Each nurse's room is fitted with open register fireplace, fresh-air inlet, and extract ventilator. The floors of all rooms and corridors are wax-polished. A central corridor is arranged the whole length of the building; the stone staircase is placed centrally on one side of the corridor, and fire-escape ladders and staircases are provided between this and the adjoining block of buildings, with exit at each floor level, also serving as means of escape for patients in the infirmary. At the north-east corner of the building on each floor above the lower ground-floor, a bathroom, water-closet, and a slop sink is provided. The whole of the floors throughout the building are of fireproof construction; the corridors are laid with wood block flooring; the bathrooms and w.c.'s are finished with granolithic paving. The joinery throughout the interior is stained and varnished. Each room and corridor has a small plaster-moulded cornice and a dado; the walls are distempered in party tints. The corridors and bath-rooms are heated by steam radiators. A small lift is provided from the lower ground-floor to the fourth floor level. Fire hydrants, with hose and appliances, are placed at the respective floor levels, immediately opposite the staircase. The building throughout is artificially lighted by electric light; provision for lighting by gas is also made. The baths are of fireclay, enamelled inside and outside, without casings, and stand clear of the walls. The drainage is on the outside of the building, with a very complete set of inspection and turning chambers, and the ventilating pipes are carried up to the ridges. The building is faced externally with picked bright yellow bricks, relieved with red brick bands and dressings. The sanitary conveniences were supplied by Messrs. Dent and Hellyer; the slop sinks by Messrs. Bolding and Sons. The electric lighting was carried out by Messrs. Graham and Biddle. The general contractors for the works, which have cost upwards of £10,000, were Messrs. W. H. Corden and Son, of Upper Tooting; Mr. F. Walker, of Shepherd's Bush, acted as clerk of works. The work was carried out from the designs, and under the supervision of, Messrs. Lansdell and Harrison, of Highbury. The design was selected in competition.

"BUILDING NEWS" DESIGNING CLUB: A TEA AND COFFEE RESTAURANT.

For description and awards see page 210.

STUDENTS' DESIGNS: MANCHESTER SCHOOL OF ART.

THE students' designs on this sheet were produced under the direction of Mr. Walter Crane during the period in which he occupied the position of art superintendent at the Municipal School of Art, Manchester. Just now, while the annual exhibition of National Competition Prize Works is open at South Kensington, this sheet of designs obtains a special interest, though, at any time, so suggestive a series of examples of decorative composition cannot fail to be welcomed by our readers. The designs explain themselves, and therefore call for no further comment beyond an approving note which we cordially record. We published some other examples from the same school on April 16 last.

SCREEN: OCKWELLS MANOR.

OCKWELLS, or Ockholt, is situated on the right of the road between Maidenhead and Bray, and is distant from the former about two miles. It is a most interesting specimen of the half-timbered

mansion of the time of Henry VI. and Edward IV., and has a beautifully gabled front. The great dining-hall, which goes up the whole height of the house and has an open-timber roof, is perfect, having a screen (herewith illustrated) with minstrels' gallery over, and divides the hall from the cloister which runs around the two sides of an inner courtyard—open stone fireplace, large central table and wooden benches, dais, and wainscoted walls. There is a very quaint Jacobean staircase in another part of the house. Some seven years ago the place was in a ruinous state and uninhabited save by numerous birds which built their nests. It has, however, since been restored, and the beautiful stained glass, which had been in safe keeping at Taplow Court, was again returned to its former position in the windows of the great hall. H. C. PULLIN.

CHIPS.

A new company has been formed in Pitlochry under the name of the Athole Building Company, which, with a capital of £20,000, has for its object the purchase and building of houses in Pitlochry, Aberfeldy, Birnam, Kinloch, Rannoch, and Blair Athole.

Kopparbergs Hofors Sawmill Company have made a contract with the Stockholm Diving Society to blow up the large and dangerous rocks under the water-level in the harbour of Norrsundet, north of Gefle. The harbour will be deepened 6½ metres under the lowest height of water. This extensive work will take two years to complete.

Plans for a new common lodging-house, to be built at the cost of the ratepayers of Southampton, have been adopted by the committee of the corporation of that borough, and the corporation are about to apply to the Local Government Board for permission to borrow £14,500 for a period of thirty years.

At the annual meeting of the Wakefield Hospital, Dr. Wright, who is 90 years of age, unveiled a portrait of the late Mr. Samuel Fozzard Harrison, who recently bequeathed nearly £25,000 to the hospital. The portrait has been painted by Mr. Fred Balshaw, of Manchester, and it is to be hung in the board-room of the hospital.

Business last week at the Tokenhouse-yard Mart was confined to three days only. Although the supply of properties was not large, the amount realised, £32,145, represents a fair average, exceeding that for the same week in last year by £670. Among landed estates, a property near Rolvenden, Kent, secured nearly £20 per acre, and a building estate of a little over three acres at Battersea brought about £3,250 per acre.

Mr. Edward B. Ellicott has been appointed City Electrician of Chicago. He devised the wiring of the Ferris wheel at the Columbian Exposition in that city, and also wired the miniature World's Fair, which was exhibited at the Atlanta Exposition.

A block of auctioneers' premises has just been built in Baldwin-street, Bristol. The premises have a frontage of 32ft., are in the Flemish style, and built of moulded brickwork with freestone dressings, the arches being of rubber brick. A pair of massive doors gives entrance to a corridor, leading direct to an auction mart, about 32ft. by 24ft., lighted from the top by a skylight. The ceiling is designed in panels of matchboard, the walls being coloured, while both the mart and the corridor are furnished with dados of painted cement. Off the corridor are arranged the offices for principals and clerks, with strong room and storage. At the front is the property sale-room. The sale-rooms and offices will be illuminated by electricity. The upper floors are divided into suites of offices, approached by a wide staircase from the entrance doors. The plans were prepared by Messrs. Gingell and Bond, of Alliance Chambers, Corn-street, and the buildings are being erected by Messrs. Ford and Canning, of King-street Hall, the owners of the property.

Madderty parish church, N.B., is at present undergoing renovation. A new entrance upon the north side, with porch facing the west, takes the place of the two openings now built up. A fresh heating apparatus is being introduced. Three window spaces have been made, and these, with the former spaces (all renewed), are in the Gothic style, and an old gallery has been removed. Among the special gifts are a tracery window of three compartments, bearing in the centre panel the crest of the Murray family, and another stained-glass three-light window, representing the Crucifixion, St. Mary, and St. John the Evangelist, and having, at the right and left lower corners respectively, the obverse and reverse of the ancient Inchoaffray seal; also a rose-shaped window, showing a series of the emblems of the Christian faith, an organ, and a baptismal font of Caen stone. The glasswork is being executed by Messrs. Ballantine and Gardiner, Edinburgh.

WATER SUPPLY AND SANITARY MATTERS.

HUDDERSFIELD.—Good progress has been made this season with the construction of the Butterley and Blakeley reservoirs, which will for some years to come, at any rate, complete the system of water storage for the Huddersfield Corporation in the Wessenden Valley. At Blakeley a by-wash is nearly completed to carry down the storm and current waters during the making of the retaining bank and the carrying out of other works. A line of railway has been continued up the valley, and the clay necessary for the puddle trench will be brought from Micklehurst, away over the Standedge Hills. The embankment of this reservoir will be 132 yards in length and 80ft. high. The capacity of the reservoir will be 80,000,000 gallons. Two-and-a-half or three years must elapse before these works can be completed. At the Butterley reservoir satisfactory progress has been made. Enormous difficulties have been encountered in securing an absolutely watertight embankment for this reservoir, which is the largest of the series in the valley, and which will hold 400,000,000 gallons of water when completed. Owing to the friable nature of the strata, it was found necessary to sink a trench 125ft. below the bed of the Wessenden stream and 209ft. below the natural banks of the stream. This great trench, which is 27ft. in breadth, is flanked by two walls of concrete so far as it penetrates the side of the valley. The construction of the embankment is now going on. At the base it will be 800 yards in length, and sloping up in terraces it will rise to a height of 98ft. The water area, when the reservoir is full, will be 42 acres. The cost of the Butterley reservoir up to date has been £151,029, and of the Blakeley reservoir £4,836. Altogether there are 450 men engaged on the works, of which Mr. J. Hughes is the resident engineer. When the two reservoirs named are completed, there will, after allowing for the large amount of compensation service of water which is sent down the valley for the use of millowners, be a supply for the inhabitants of Huddersfield for 200 days, or, if the reservoirs should be full, for 328 days. Altogether the storage capacity of the corporation's waterworks is 1,640,368,120 gallons.

MANCHESTER.—The difficulty experienced by the corporation in the treatment of the sewage or the city, was a subject of discussion at Monday's meeting of the Mersey and Irwell Joint Committee. A further extension of time was asked for on behalf of the Manchester Corporation. The position of the corporation was described by Mr. Alderman McDougall, who said that a scheme of artificial filtration dealing with the entire sewage of the city would cost, according to an estimate of the city surveyor, no less a sum than £275,000, and the filters would need renewal every three years, at a further cost of £120,000. These figures were so alarming that some members of the committee were disposed to revert to the culvert scheme. For the same capital expenditure they could take the effluent altogether away from the neighbourhood. The committee decided to give the corporation a further period of three months in which to prepare a scheme.

The commission for the presentation portrait and replica for the Lord Mayor of Birmingham, will be given to Mr. J. J. Shannon, A.R.A.

It was reported to the Handsworth Technical Instruction Committee that the work in connection with the building of a new technical school, which is being erected at a cost of £10,000, was progressing, and the school would be ready for opening on the 29th September.

A petition has been presented to the Glasgow Dean of Guild Court to have the spire of St. Enoch's Church in that city, which was struck by lightning on Wednesday evening in last week, examined by an expert builder, and an inspection of the church has been made by Mr. Whyte, the master of works, and Mr. George Barlas. Mr. Whyte is of opinion that 20ft. or 30ft. of the spire will have to be taken down. There is at present, however, no danger to the public.

The free public library at Burton-on-Trent was opened on Wednesday. The old institute was closed in October last, and since then a number of structural alterations had been made in order to provide room for a subscription library as well as the free one. The electric light has also been introduced throughout the building, the contractors being Messrs. Strode and Co., of London. The alterations have been carried out from plans prepared by the late borough surveyor (Mr. J. E. Swindlehurst), who personally supervised the work, assisted by Mr. Longley, while Mr. Holcrow has acted as clerk of works. The contracts had been obtained by Messrs. J. and T. W. Selby (brickwork and portion of woodwork), Mr. Stevenson (woodwork), Mr. Pickering (glazing, &c.), and Messrs. Ordish and Hall, Mr. F. W. Wilson, and Mr. B. Abrahams (furnishing).

STAINED GLASS.

WINCHESTER CATHEDRAL.—The south window of the Lady-chapel of this cathedral has been filled with stained glass as a memorial to Bishop Thorold, and portions of the old painted glass have been worked in by the artist, Mr. C. E. Kempe, who prepared the designs and executed the work. The memorial window contains representations of scenes in the life of Our Lord in which the Virgin Mary appeared, and in the upper part are Saints Jerome, Ambrose, Gregory, and Augustine; in the centre, St. Elizabeth and St. Margaret; while to the right are St. Birinus, the Apostle of Wessex, Honorius the Pope, who sent him; St. Swithun, who was buried outside the cathedral and afterwards removed within, and St. Alphege. Above these are St. Anthony (the Bishop's Christian name), the Venerable Bede, St. Christopher, Kynegils, the first Christian King of Wessex, Bishop Fox, and in the extreme head of the window Henry VII. and Prince Arthur. The eastern portion of the Lady-chapel was rebuilt in the reign of Henry VII. as the thank-offering of his Queen, Elizabeth of York, for the birth of her eldest son Arthur, which took place at the Royal castle at Winchester in 1486. At the bottom of the window are an inscription, the arms of the See, and Bishop Thorold's family arms. It is intended to fill the north window of the Lady-chapel with other stained glass representations of scenes in the life of Our Lord in which the Blessed Virgin appears. The east window has been chosen for the purpose of commemorating the Queen's Diamond Jubilee, and Mr. Kempe has designed for this purpose a Jesse window with kneeling figures of English Sovereigns at the foot, one of the figures being that of Queen Victoria.

CHIPS.

A Congregational church is being built on the Avenue at Southampton. It is of brick, with stone facings to the Avenue and Alma-road, and will cost £7,000.

At the Coventry County-court on Saturday the town clerk applied for a further suspension of the injunction made against the Coventry Corporation in respect of polluting the river Sherbourne with sewage. His Honour consented to suspend the injunction over the January Court.

The memorial stone of a Church Sunday-school was laid at Hemyock on Saturday. Mr. E. T. Moward, of Wellington, Somerset, is the architect.

The new Sanatorium, Hastings, is being warmed and ventilated by means of Shorland's patent Manchester stoves, grates, and patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland and Brothers, of Manchester.

A new wing, the gift of Col. R. S. Donkin, M.P., which has just been built as an extension of the Tynemouth Victoria Jubilee Infirmary, North Shields, was formally opened on Friday by Earl Percy. Mr. F. R. N. Haswell is the architect.

The ceremony of laying the foundation stone of St. Mary's new Roman Catholic church, Eccles, Salford, has been fixed for Saturday, 28th inst.

Sir Hedworth Williamson, Bart., of Whitburn Hall, has just submitted to the Sunderland Corporation the plans of a block of model dwellings, two stories high, which he proposed to erect at Monkwearmouth, where they will replace a good deal of old property owned there by the baronet.

The surveying committee of the Bath Corporation approved, on Friday, of plans prepared by the surveyor of works for a new roadway to lead from the churchyard to York-street. By means of it there will be provided ample and improved access from the churchyard to the Abbey-green, while a broad flight of steps will afford access to the baths. The cost is estimated at £900. Another long discussion took place about the furniture for the new pump-room annexe, it being agreed eventually that Mr. J. M. Bryden, F.R.I.B.A., of London, the architect for the new buildings, should be asked to furnish designs.

The Hampshire County Council, at their meeting on Monday, elected Mr. Herbert W. Butler as assistant county surveyor.

The contractors for the new North Bridge, Edinburgh, have received instructions to have the work completed at the end of August.

A report is being drawn up by the Liverpool Corporation surveyor bearing upon a question which has been put to him as to the possibility of making land in the possession of the municipality available for the purpose of allotment gardens.

Mr. Silvanus Trevel, F.R.I.B.A., of Truro, was, says the *West Briton*, "absent from a meeting of the Cornwall County Council on Tuesday last for the first time since that body was established. His absence on this occasion was, of course, due to the fact of his having resigned his seat. Is there any other member, we wonder, who has attended every meeting of the council?"

Lady Riddell has bequeathed a number of family portraits by Raeburn, Martin, and Partridge to Sir Rodney Stuart Riddell; but in the event of his being unmarried at the time of Lady Riddell's death, or, if married, without issue at that time, she directs her executors to hand over these portraits, along with certain specified busts, to the Scottish National Portrait Gallery under the name of "The Riddell Bequest."

In Friday's list of adjudications in bankruptcy the names appear of Arthur Victor Ratty and Harold Frederick Ratty, trading as A. and H. Ratty, St. Leonard's-street, Bromley-by-Bow, E., and Mansfield-road, Ilford.

The Great Northern Railway Company announce that the Station Hotel at Leeds, which has undergone considerable structural and other alterations and improvements, will be reopened for the reception of visitors on Tuesday in next week. The works of improvement, &c., have been undertaken by Messrs. Maple and Co.

The Dean of Guild Court at Stranraer have approved of the plans for the erection of a new post-office in Charlotte-street.

Extensive additions are about to be made to the county lunatic asylum at Bodmin, from designs by Mr. Silvanus Trevel, M.S.A., of Truro. The outlay will be about £35,000, and accommodation will be provided for about 350 more patients. This, with the necessary attendants, will make the population of the asylum not far short of 1,500.

The Leeds School Board, at their last meeting, accepted tenders, amounting to £3,804 14s., for the erection of a new infants' school at Hunslet Carr. This will provide 530 school places at a cost of £7 3s. 6d. per head. The board also approved of tenders, amounting to £875, for the enlargement of South Accommodation-road School, an extension which will provide 100 additional places at a cost of £6 15s. per child; and also a tender for the heating of Whingate Board School, at a cost of £185 10s.

The Tate Gallery of British Art at Millbank will be opened to the public on and after Monday next. Like the Trafalgar-square gallery, it will be opened on Sundays from 2 till 6 p.m., the first occasion being Sunday the 22nd inst.

The inhabitants of Dalton, near Richmond, North Riding, having decided upon the erection of a new church as a Diamond Jubilee memorial, the sum of £600 has so far been raised.

Lord and Lady Tweedmouth paid a visit on Saturday to Hutton Castle, and inspected the work now being executed at that residential mansion. During their stay they fixed the site of the new entrance gateway for the western approach to the Castle. Instructions were given to Mr. Duns, architect, of Newcastle-on-Tyne, to prepare the necessary plans.

A special meeting of the Chester city council was held on Saturday to consider the acceptance of a contract for the restoration of the council chamber of the town hall, recently destroyed by fire. Six tenders had been received, ranging from £7,970 to £9,491. The mayor, in moving the adoption of a tender for £7,970 by Mr. W. W. Freeman, builder, Chester, intimated that the work would be completed by the 31st May next. A further recommendation of the committee to appoint a Mr. Helm (who had occupied a similar post at the electric light station) as clerk of the works at £3 10s. a week, including expenses, gave rise to an animated discussion. It was moved as an amendment that Mr. Arthur Jones, a young local architect (and son of a member of the council), be appointed at a salary of two guineas per week. The amendment was carried by 12 to 4.

At the half-yearly meeting of the Metropolitan District Railway Company, held on Monday, the chairman reminded the shareholders that Parliamentary sanction had been obtained for extending the system from Ealing to Harrow, and from Harrow to Uxbridge. He added that the directors intended to go on with this undertaking as a single piece of business, instead of in two portions, and, all being well, they hoped to have the line open from Ealing to Uxbridge within two years from now. Their Ealing extension cost them £90,000 a mile, whereas the Harrow and Uxbridge line would cost about £32,000 a mile. Contracts had been made in respect of the Harrow line with a responsible contractor of considerable experience at a very moderate price—a price sanctioned by Sir John Wolfe Barry; and the same contractor, backed by the same financial people, would, he presumed, accept the contract on the same terms to Uxbridge. They had also obtained Parliamentary sanction for a deep level line beneath this system between Earl's Court and the City; for a junction in Whitechapel and Bow with the Tilbury system; and an independent company had also obtained powers to construct an underground electric railway between Piccadilly-circus, and South Kensington, where it would be possible to effect a junction with the proposed deep-level District Railway.

LEGAL INTELLIGENCE.

PRIVATE OR PUBLIC ROAD.—At the Bradford County Court, on Friday, his Honour, Judge Bompas, Q.C., delivered judgment in the case of the Pudsey Urban District Council v. Mr. William Henry Stott and Others. The claim was for £28 14s. 9d., expenses incurred by the plaintiffs in sewerage, levelling, paving, metalling, flagging, channelling, and making good premises fronting and adjoining a certain street called Green-top, in Pudsey. The plaintiffs also claimed 10s. 8d. interest from the date when they made demand for payment of the sum they claimed. A similar claim has been made on various other property-owners in Pudsey, and this was a test case to decide the liability of all the parties. The action was tried at the Bradford County Court on July 8 last, when a number of witnesses were called on both sides. The plaintiffs contended that the street was a private one, and that the defendants were liable for its repair. The defendants, on the other hand, contended that it was public, and that they were therefore not liable. The Judge decided that evidence had been called which justified him in coming to the conclusion that the road was a public one before 1836 (the date of the Highways Act), and that the footpath had been repaired by the local authority some thirty years ago. He therefore found that the road was a highway repairable by the inhabitants at large, and gave judgment for the defendant with costs. Costs on the higher scale were allowed to defendant. Stay of execution was granted in the event of an appeal.

THICKNESS OF WALLS BELOW BRESSUMMER.—At the Lambeth Police-court, on Friday, Mr. Hopkins heard an appeal by Mr. John Tyerman, builder, Walworth, against a notice of objection served upon him by Mr. Ellis Marsland, M.S.A., district surveyor, in connection with the rebuilding of the "General Havelock," Parkstone-street, Peckham. Mr. Pasmore appeared in support of the appeal. The matter was brought before the Court under the provisions of section 150 of the London Building Act, which gives a builder power to appeal to a petty sessions court should he be dissatisfied with the decision of the surveyor. Mr. Pasmore stated that the notice of objection served upon the appellant by the district surveyor had reference to the thickness of the external walls of the basement of the building. The first schedule to the Act (Part 1, sec. 3) dealt with the thicknesses to be observed in the building of a wall exceeding 40ft., but not exceeding 50ft. in height, the thickness varying according to the length of the wall. In this case the wall was 43ft. high. Section 7 of the first schedule (preliminary) to the Act, provided "for the purpose of determining the thickness of a wall, the height of such wall shall be measured from the base of the wall to the top of the topmost story, whether such wall is carried to the full height or not, or, in the case of a gable, when there are no stories in the roof, to half the height of the gable." The definition clause of the Act provided that "The expression 'base' applied to a wall means the underside of the course immediately above the footings, if any, or in the case of a wall carried by a bressummer, above such bressummer. The definition of the word 'bressummer' was a wooden beam and a metallic girder, which carries a wall." In this case the district surveyor claimed that the wall over which the dispute had arisen should be 17½ inches thick for the basement story, it being in his view a wall 43ft. in height. Section 56 of the Act, which dealt with bressummers, showed that an entirely different state of things had to be considered where bressummers were employed. His (Mr. Pasmore's) point was that the wall began with the bressummer, and not with the basement. He might say that Mr. William Bruton, the architect, was building houses in every district in London, and Mr. Marsland was absolutely the only district surveyor who had called upon Mr. Bruton to build his basement wall according to the height of the building if there was a bressummer. He submitted that Mr. Marsland had misconceived the intention of the Act. Mr. W. M. Bruton, the architect, was called and examined as to the details of the work. There would be, he said, an open shop front with a bressummer above carrying the superstructure. Mr. Marsland: The external wall of the basement, I see on your drawing, is 14 inches. The Witness: What I call the retaining wall between the piers; yes, that is so. Mr. Marsland: I am asking that it should be 17½ inches thick? The Witness: That is so. Mr. Hopkins: What I am wondering is why a wall is less a wall within the statute because half way up, it may be, there is a bressummer. Mr. Pasmore: Because the height of the wall has to be measured from the base. The base of a wall carried on a bressummer must be from the bressummer. Mr. Hopkins: Yes, when you are dealing with the thickness of the wall above the bressummer, I agree it may be so, but I am not dealing with that. I am dealing with the wall below the bressummer. Mr. Pasmore: There can't be two bases to the same wall. The wall beginning in the basement does not go higher than the surface of the ground. Mr. Hopkins: Why is

it less a wall throughout the whole height because it has a bressummer? Mr. Pasmore: Where the shop-front is, there is no wall at all. I will ask you to look at the definition of the word "base." Mr. Hopkins: My difficulty is that I am not dealing with anything above the bressummer. I am dealing with the wall below the bressummer and which carries the bressummer. Mr. Pasmore: The wall below the bressummer extends to the ground level only, and is not a wall 43ft. high. Mr. Hopkins: If you were dealing with an ordinary shop with brickwork all the way up, the question would not arise. You say that because you have an archway upon a bressummer your statutory position below the bressummer is altered. Mr. Pasmore: That is so, because under section 56 we have to support the bressummer in accordance with the provisions of the Act of Parliament. Mr. Hopkins came to the conclusion that the district surveyor was right, and dismissed the appeal.

"WALKING TIME" ALLOWED.—Mr. Thomas Ravey, builder, of 229, High-street, Shoreditch, was summoned at Worship-street Police-court, on Friday, by Edwin Alger, John James, Alfred Halzman, and Robert Richers, for money earned as French polishers. Mr. Thompson, barrister, appeared for the men on the part of the Amalgamated Society of French Polishers. The amount claimed by each plaintiff was 10s. 9d., but as to the 10s. there was no dispute. The 9d., it was explained by Mr. Thompson, was charged under the custom of the trade for "walking time" in going to and from the employer's head office and the place of the job. Mr. Ravey denied that it was the custom of the trade of French polishers, although it existed in connection with parts of the building trade. Mr. Thompson put in the rules of the men's Society, and said that Mr. Ravey had sent to the men's place of call for them to attend at his office. He submitted that that was to be taken as an acquiescence in the rules which the men put forward. Mr. Corser asked the defendant, as he denied knowing the rule, whether he had made any inquiry as to it, and Mr. Ravey replied that he had not. Mr. Corser decided that he was bound by the men's rule, in the absence of first objection, and made an order for amounts claimed, with 2s. cost of summons. He refused other costs, but observed that it was quite a reasonable case for the Society to have fought for the men.

ACTION TO SET ASIDE AN AWARD.—On Saturday, in the Queen's Bench Division of the High Court of Justice, before Mr. Justice Lawrence and Mr. Justice Collins, sitting as a divisional court, a motion was made in the referred action of Mr. Abraham Williams, contractor, against the Barmouth Urban District Council, Merionethshire, to set aside the award of the arbitrator in favour of the plaintiff. Mr. Abraham Williams entered into a contract to execute certain sewer works in Barmouth for £2,450. The engineer subsequently varied the contract, and plaintiff sent in a bill for £3,400. The board disputed payment of £959 5s. 10d. of that amount, the action was brought, and the question in dispute referred to arbitration. The umpire gave his award for the whole amount, £3,400. The Board resisted payment on the ground that the plaintiff had not executed all the works specified in the agreement, alleging that he had only done about two-thirds of them. The agreement was entered into in 1889, and the action was brought in 1895. It was referred in January, 1897, and the umpire made his award on May 29 of that year. The circumstances of the case were these:—The plaintiff by his contract undertook to construct a sewer to a sea outfall 375 yards from the shore. As originally planned the sewer was to be constructed on piles; but a rocky bottom being met with, the engineer altered the contract by arranging that the pipes should be anchored to heavy stones. This involved the extra cost which brought up the amount of the contractor's bill to £3,400. The ground on which the urban district council disputed £959 of that amount was that the engineer had gone beyond his authority, and that the contractor had concealed the fact that he had carried the pipe to a point 133 yards short of the 375 yards which the Local Government Board had imposed as the condition of their sanction to the sewer. The application of the urban district council was that the award should be sent back to be stated in the form of a special case, and Mr. Danckwerts pointed out that a similar course had been pursued in the case of the Kirkleatham Board and the Stockton and Middlesbrough Local Water Board. It was the contention of applicants that points of law were involved, and that therefore a special case should be stated. What was referred to the arbitrators was the question of facts and the question of amount; but the case raised points of law which the council had the right to raise. Mr. Channell, Q.C., for Mr. Williams, referred to a compromise which it was alleged had taken place between the parties, and urged that that was a bar to referring the case back. Mr. Danckwerts pointed out that the root of the matter lay in the fact that when it was discovered that the contractor had to deal with a rocky bottom, the engineer recommended that the pipes should be

anchored to heavy stones. He submitted that the old contract lapsed when that was done. A compromise was effected as between the two contracts; then the arbitrator had made it binding without affording the council an opportunity of raising the point of law by having a case stated. The sewer was to be carried out 375 yards; but the fact had been concealed that it was 133 yards short of that. It was years since this work commenced, and he asked the Court to take a broad view of the matter. At the adjournment, on Monday, Mr. Danckwerts submitted that neither under the common law nor under the Public Health Act of 1875 could the Barmouth Council be called upon to pay the amount. Moreover, if the facts were found as it was admitted they would be found, it would then be seen that the plaintiff had not finished the work which he had undertaken to do: indeed, he had not done more than two-thirds of it. The plaintiff was seeking to impose charges upon the ratepayers in respect of work which had not been done in accordance with the requirements of the Public Health Act in regard to contracts being under seal, &c. The contract in this case was not under seal, yet the arbitrator had exceeded his function by finding in point of law that the contract was a valid contract. Mr. Justice Lawrence, in giving judgment, said he was of opinion that the case ought not to be sent back to the arbitrator to be stated. The local board had entered into a contract under seal, but the engineer, according to powers contained in that contract, altered and varied its terms. It was now argued that every one of these alterations and variations should have been made under the seal of the Barmouth District Council. If that contention were to hold good, then not the slightest alteration or alteration of any contract with a local authority could be effected save under the seal of that authority. But in this case it was clear that the board had entered into a compromise with the plaintiff for £1,020, and only afterwards came to the conclusion that they were wronging the ratepayers in not having the second or varied contract under seal. In these circumstances the matter had been submitted to an arbitrator, who, it seemed to the Court, was right in his finding, and there was no reason whatever for sending the case back to him. Mr. Justice Collins concurred, and said in his view the plaintiff was entitled to judgment for the amount claimed. The motion was dismissed with costs, and judgment entered for the plaintiff, whose counter motion was allowed with costs. Stay was granted on the payment of the money into court.

TRANSFERRED OWNERSHIP AND THE LONDON BUILDING ACT.—At the South-Western Police-court on Tuesday, Mr. Francis gave an important decision in a summons against Mr. J. Schiefer, a builder, of Grove-mansions, Clapham-common, issued at the instance of the London County Council. The defendant was fined 10s. last March for erecting wooden structures at the rear of the mansions without the leave of the Council. As they were still allowed to stand, he was further summoned for the recovery of the cumulative penalties. That summons, however, was dismissed, the magistrate being of opinion that the Council had proceeded under the wrong section of the Act. The Council accordingly issued a summons under Section 170, the effect of which is a magisterial order empowering the Council to enter the premises and demolish the illegal structure, and charge the defaulter with the expenses. Mr. Thomas A. D. Chilvers supported the summons for the Council, and Mr. Warren, the defendant's counsel, raised the plea that his client, having parted with the property since his conviction in March, had no longer control over the structures. The magistrate said the section of the Act clearly intended to reach the premises without reference to the owner or the occupier. Certain buildings were condemned, and the important thing was to demolish them. If the defendant would not do it, no question of ownership could stop the Council from carrying out the order of condemnation. He gave his decision in favour of the council, with two guineas costs. On the application of defendant's counsel, his Worship agreed to grant a case for the consideration of a higher court.

BLACKBURN CHAPEL AND ITS "ANCIENT LIGHTS."—SHORROCK AND OTHERS v. BIRTWELL.—A motion was made in the Chancery of Lancashire on Tuesday in the case of Shorrocks and others v. Birtwell. Plaintiffs, the trustees of the Clayton-street Wesleyan Methodist Chapel, Blackburn, sought an injunction restraining defendant from proceeding with any building on his premises so as to darken, injure, or obstruct any of the ancient lights of the plaintiffs' chapel, and a mandatory order for defendant to pull down any building or such portion of a building as darkened, interfered with, or obstructed any of plaintiffs' ancient lights. It was contended by Mr. Bather, on behalf of plaintiffs, that defendant had committed a breach of faith in continuing to build a wall against an undertaking he had given. In April they found that he had commenced to build the wall so as to obscure the lights of the chapel. Negotiations took place between the parties, and towards the end of June defendant said

he would have to take counsel's opinion; but in the mean time, contrary to what he said, he went on building, and continued until the wall ran up to its present height. From affidavits read it was stated that defendant's wall was a serious detriment to the ancient lights, and so diminished the light that the gas had to be put on at the evening service earlier than before. The defence was that the defendant, for whom Mr. Radford appeared, had built up the portion co-extensive with the old wall to the present height before receiving any notice, and what plaintiffs complained of now was the continuation of the wall. It was as high on April 26 as it was now. The Vice-Chancellor said that in the chapel there were three windows, the bottom sill of which was 24ft. from the ground. In 1881 the chapel was demolished, and a new building erected, set back at a distance of 13ft. from the site of the old wall, and three windows were put in corresponding to the three old windows on what they might call the second floor; and they also put in a window on the ground floor. The three windows on the higher floor corresponding to the windows in the old building were undoubtedly entitled to the access of light, to so much of the light as passed through the old windows; but the evidence was not precise as to the exact position of the old windows and corresponding position of the new ones. It was incumbent on the plaintiffs to show which part of the new windows corresponded with the old ones. He could not see that the claim for access of light through the new window on the ground floor was justified, and he did not see any signs of a breach of agreement. It seemed to him that it would be wrong to grant an injunction. He had an open mind, but his impression was that the action would fail.

IN RE SIMEON WARDLE.—A meeting of the creditors of Simeon Wardle, now residing in Warley-road, Blackpool, formerly of Southport, and carrying on business as a contractor, decorator, and cabinetmaker under the style of T. and S. Wardle, of South Parade, Manchester, and Carnarvon-street, Manchester, was held on Tuesday afternoon at the offices of the Official Receiver in Bankruptcy, Manchester, Mr. C. J. Dibb, the official receiver, presiding. From the debtor's statement of affairs it appeared that the liabilities amounted to £1,765, and the assets to £889, after preferential claim had been met, the deficiency being £875. Bad debts, legal expenses, loss on goods sold by sheriff, and loss on contracts were put down as the cause of failure. A Manchester chartered accountant was appointed trustee, and a committee of inspection was elected.

FRANCIS MORTON AND CO., LIMITED.—At a meeting of creditors held last week, after hearing a report as to what transpired since the date of the last meeting, the action of the committee and Receiver was approved, and the following resolution was passed:—"That the following committee be reappointed, namely:—Mr. James Dodds (Pearson and Knowles Coal and Iron Co.); Mr. Joseph G. Wright (Messrs. Isaac Jenks and Sons); Mr. Wm. Henderson (Messrs. Henderson and Glass); Mr. W. H. Hewlett (the Wigan Coal and Iron Co.); and Mr. John Hall (the Sheepbridge Coal and Iron Co.); to confer with the Receiver and Liquidator, with a view to the realisation of the assets to the greatest advantage of all concerned, and that, unless previously summoned, the creditors be called together again in three months' time."

Professor Reinhold Begas, the sculptor of the National Monument to the late Emperor William at Berlin, has been induced by numerous hostile criticisms to publish an essay stating his original conception of the monument, and the alterations he was compelled to make against his will.

At Sandbach, Cheshire, on Wednesday, Elisha Lees was summoned upon a charge of unlawfully appropriating to his own use £1,750 whilst acting as trustee of the money. He did not appear, and a warrant for his arrest was granted. Lees has held many responsible positions, having been surveyor to the local authority, secretary to the gas company, collector of Government taxes, holding also other offices of trust.

At the half-yearly meeting of the Great Northern Railway Company, held on Wednesday, the chairman, the Right Hon. W. L. Jackson, M.P., referred to the improvements now being made by the company. At Manchester, he said, they were building a separate station and providing accommodation for their traffic at a cost of one million. The contract had been let to a firm who had entered into an obligation to put the company in possession of a portion of the station on the 30th June next year, and with the whole of it before the 30th of June in the following year. At Liverpool, also, they had bought a site and had opened agencies; while at Nottingham they had become joint owners of the central passenger station. With the exception of a very short link that would be dealt with subsequently, the company had now practically four lines all the way from London to Huntingdon, and would ultimately have four lines to Peterborough.

Our Office Table.

THE South Kensington Museum's Committee have not concluded their inquiries this session, and ask to be reappointed next year. Meanwhile, in a second report just issued, the committee "feel bound to confirm and emphasise the recommendation of their first report as to the necessity of immediate action to secure the buildings against fire." They also "express their sense of the importance of completing the building on the east side of Exhibition-road, with a view to the safe deposit and satisfactory exhibition of the art collections (including the Indian section, now on the west side of the road in a hired building)."

THE Bill for the creation of a Greater Bristol having been passed with some clippings and reductions, and received Royal assent, the *Western Press* is advocating the concentration and rebuilding of the municipal buildings on a scale at once comprehensive, adequate, and worthy of the extended city. As our Bristol contemporary remarks, "Bristol has, in the matter of its public offices, reduced decentralisation to a fine art. The sanitary offices are in one place, the medical officer's department in another, the central rate office, police-court, gas examiner's office, and weights and measure department have been just put down here and there where there happened to be room for them, and without any kind of suggestion that they form parts of a whole, or that they have any connection with the centre of municipal activity—the Council House. If an important public body comes to Bristol, the most commodious apartment the civic hospitality can offer is that in which Bristol holds its own town's meetings—the Criminal Court at the Guildhall. The fact that the Docks Committee are housed in a distinct building in Queen-square has some justification in the proximity of the ships; the erection of offices for the Electrical Department near the central generating station may also be defended, although, when the concentration does come about in a building worthier of Bristol than the present Council House, there will be something to be said in favour of the electrical accounts office being somewhere near the spot where other debts to the corporation have to be paid. No mention has been made of the venerable public library in King-street, with its wealth of literary treasures, which has earned the title of being the oldest institution of the kind and structurally the worst in the country. The late city surveyor, Mr. Josiah Thomas, prepared no fewer than 200 plans with a view to bring the matter to an issue; hundreds—probably thousands—of pounds (for no one knows exactly what the outlay has been) have been spent on mere patch-work on a building which might have sufficed for the early part of the century when it was erected, but which is, in 1897, quite out of date."

MR. CHAMBERLAIN, replying to correspondents' inquiries regarding the provisions of the Workmen's Compensation for Accidents Bill, says:—"The Provisions of the Bill will apply to all buildings in the process of demolition, to all buildings which are being constructed with the help of steam, or any mechanical power, and also to buildings which are over 30ft. high. The definition is taken from the Factory Acts, and will include the great majority of all the accidents which occur in the trade, while at the same time it is intended to relieve from liability the very small builder, who is often no better off than his own workmen."

AMONG the measures to which the Royal Assent was given at the prorogation of Parliament on Friday were the following:—Patent Office Extension, Public Offices (Whitehall) Site, District Councils (Water Supply Facilities), Workmen (Compensation for Accidents), Metropolitan Water Companies, Post Office (Sites), North Pembroke-shire and Fishguard Railway, Great Western Railway (Bristol Lines), Brompton and Piccadilly Circus Railway, Great Northern and City Railway, Weston-super-Mare Grand Pier, Dublin, Wicklow, and Wexford Railway (New Ross and Waterford Extension), Hastings Harbour District Railway; Birmingham, North Warwickshire, and Stratford-upon-Avon Railway, Birmingham Churches, Invergarry and Fort Augustus Railway, Thames Subway (Greenwich to Millwall), Dearne Valley Railway, Southwark and Vauxhall Water, Metropolitan District Railway, Highgate Woods Preservation, Watford, Edgware, and London Railway,

London County Council (General Powers), Harrow and Uxbridge Railway, and the White-chapel and Bow Railway.

WE learn by the *Church Times* that three of Mr. Pearson's famous churches are now in course of completion. These are (1) St. Augustine's, Kilburn, the spire of which will shortly be finished; (2) St. Stephen's, Bournemouth, known as the Bennett memorial church, the chancel of which will be complete and consecrated in October next; and (3) Truro Cathedral, where the workmen are now busy in putting in the foundations for the remaining seven bays of the nave.

THE annual report of the director-general of the Geological Survey, issued on Tuesday, states that the area dealt with last year amounts to 740 square miles, with 3,866 miles of boundary line. A portion of the staff is engaged in the centre and south of England upon a survey of the drift deposits, and making also such revisions in the solid geology as are found necessary. The re-survey of the South Wales coalfield has made satisfactory progress, and that of the North Staffordshire coalfield has been continued. The mapping of the Isle of Man has been completed during the year. "A Memoir on the Geology of Appleby, Ulswater, and Haweswater," by Mr. J. R. Dakyns, Mr. Tiddeman, and Mr. Goodchild, has been printed, and will shortly be issued. Three sheets of the one-inch map (new series) have been published, comprising parts of Hampshire, Dorsetshire, and the South Wales coalfield. New editions of two six-inch maps (Lancashire) have been published. Six new sheets of the general map of England and Wales (scale, four miles to one inch) have been published—namely, Northumberland, Isle of Man, Lake District, North Wales, Central England and South Wales, and North Devon. Sheet 1 (title) and sheet 3 (index of colours) have also been prepared, so that the entire map is now published. Sheet 6 (East Yorkshire), 9 (Eastern Counties), and 15 (Sussex coast) have been reissued, printed in colours. One sheet of vertical sections has been published: this illustrates the geology of the South Wales coalfield, and has been prepared by Mr. A. Strahan and Mr. W. Gibson. MS. copies of 121 six-inch maps have been deposited in the office for public reference.

THE western branch of the Sanitary Inspectors' Association, of which the Right Hon. C. Seale Hayne, M.P., is president, will hold its annual meeting at Glastonbury to-day (Friday) and to-morrow (Saturday). The visitors will be received by the Mayor and Town Councillors this afternoon, after which the general meeting of members will be held for the reception of the report, election of executive, &c., and this will be followed by a dinner at the famous George Hotel. To-morrow morning, after inspecting the Glastonbury waterworks and sewage-works, the members will visit Street, where they will be received by the chairman and members of the Urban District Council. They will inspect the Street sewage-works and the blue lias stone quarries under the guidance of Mr. T. Collingwood, surveyor to the Urban District Council, after which they will be entertained to luncheon by Mr. W. S. Clark, J.P., the chairman of the council. On returning to Glastonbury a public meeting will be held at the Town Hall, under the presidency of the Mayor (Alderman Porch). Alderman J. L. Bulleid has promised an address on "The Past and Present Sanitation of Glastonbury," and Mr. C. MacMahon, of Torquay, will contribute a paper on "The Training of Sanitary Inspectors."

ONE hundred and fifteen projects for an attraction of an extraordinary nature at the Paris Exhibition to be held in the year 1900 were brought up for consideration at the meeting of the committee on Saturday. They included a proposal to build a glass under-water restaurant, and another for two immense mirrors to be attached to the Eiffel Tower, one at the top and the other at the bottom, so that people promenading round the lower one should see a reflection of nearly the whole of Paris. Another suggestion was to erect a memorial temple of present-century progress, with representations of the eight great nations of Europe. A fantastic inventor submitted an idea for the erection of a model town of the future, in the year 2000 or some such advanced period. A doctor urged the construction of a miniature hygienic city, to be built on the most advanced and perfect hygienic principles, and inhabited by people living in strict accord-

ance with the laws of hygiene. A startling proposal was that a house 600ft. high should be erected, in order to show how tall a habitable building could be made without danger. Another scheme was for the construction of a street to be guarded from end to end by detachments of soldiers clad in the different uniforms worn in France since the time of the Gauls. Yet another suggestion was for the erection of an enormous vertical screw, with a massive revolving nut fitted up as a café and restaurant travelling up and down it continually. A lady recommended a wooden reproduction of the Horse of Troy, fitted up internally with various apartments capable of accommodating 1,000 people at a time; while a daring gentleman considered a huge beauty show with deputations of ladies from every country in the world would prove an irresistible attraction. A great many schemes were presented for making use of the Eiffel Tower in all sorts of strange and fantastic ways, several being that the tower should be encircled with a spiral railway, while one proposal was that it should be used as a toboggan chute. Another inventor desired to cover it so as to make it a gigantic copy of Bartholdi's famous statue of "Liberty" at New York. In the end the committee decided that none of the suggestions were sufficiently practical or worthy of adoption.

THE excavations that have been going on for months past on a plot of ground belonging to Herr Schabb, a manufacturer at Trèves, have resulted in the discovery of a Roman private house. The façade lies parallel with the principal street of the old Roman city. A number of blocks which served as pedestals for the wooden or stone pillars of a portico still remain. The entrance is distinctly recognisable between two buttresses and an immense heap of stones. A long entrance-hall running right through the house, from front to back, is intersected by another corridor, so that the building is divided into four parts. Side corridors lead into the rooms. Of these the marble tessellated bath rooms for hot and cold water and warm air lie, as usual, side by side. The two latter were supplied with warm air through subterranean passages. The escape of the smoke was effected by means of hollow tiles laid on one another. The south-western rooms have cellars under them. In a light court in the same part of the house there is a well-preserved window, the first ever found in a Roman building. The most interesting thing, however, is the richly-coloured mosaic floor. Experts assign the building to the first half of the fourth century.

GOVERNOR HASTINGS, of Pennsylvania, has vetoed the Bill to regulate the construction in that State of buildings in cities of the first class, which, of course, was of particular interest to Philadelphia. The measure provided that every building hereafter erected which shall extend to a greater height than 70ft. above the sidewalk level, and every building hereafter erected or altered, to be used as a hotel, apartment, tenement or lodging-house, containing more than 50 rooms above the first floor, and every public hospital, asylum, or institution for the care or treatment of insane, weak-minded, or indigent persons, if more than two stories in height, shall be approved by the Bureau of Buildings Inspection. Governor Hastings states that he is convinced that the Bill was not in the interest of the protection of human life, as it sought to relieve owners of extremely high buildings and buildings densely occupied, as well as buildings occupied by the sick, insane, and helpless, from the erection of fire-escapes as now required by law. The existing safeguards under the fire-escape laws upon the statute books will, in his judgment, prove more efficient in saving human lives than the provisions of the Bill under consideration.

THE largest hotel structure in the world is to be erected in Boston, Mass., the coming year, and its total cost will be something over 3,000,000dol., says the *Southern Manufacturer and Builder*. The building will be eleven stories high, and will be faced with fancy buff brick and terracotta. The design is after that of the palace of the Duke of Mecklenburg-Schwerin, in the north of Germany. The hotel will be in three sections, each one containing more than 700 rooms, and making a total of 2,250 separate apartments. The plans provide for an open court between each section of the house 70ft. wide, and giving ample light to the rooms facing it. Then in each section there will be an interior court 35ft. square. The dining-room is to be on the north side, next to the river,

a one-story structure, divided into a number of cosy, half shut-in apartments. The suites will be of various sizes, and each will have the advantage of a double elevator service, one set of elevators being for passengers and the other for freight. There will be 21 elevator wells in the building. Features of the hotel will be the banqueting hall, the ballroom, and the ice skating rink, the latter to be used in the summer as a bicycle pavilion. The hotel will be specially fitted for the purpose. There will be an elaborate refrigerating apparatus in the hotel, and this will be used to make ice for the skating rink, the floor of the rink being flooded and the water congealed. Many other unusual features are in the plans.

THE Administration Report on the Railways in India for 1896-7 has just been published as a bulky bluebook of 280 pages, illustrated with a large map. From this it appears that the total length of railways open and sanctioned on the 31st March, 1897, was 24,528½ miles, being a net increase of 1,062½ miles during the year. The total length of railways open for traffic on the same date was 20,390½ miles, being a net increase of 713½ miles, leaving 4,138½ miles still under construction or sanctioned. The mean mileage worked during the calendar year was 19,783 miles, being an increase of 623 miles over the figures of the previous year. The total capital outlay on railways open to traffic amounted on the 31st December, 1896, to Rs. 253.16 crores, being an increase of Rs. 8.78 crores as compared with the expenditure incurred to the end of the previous year. The gross earnings in 1896 amounted to Rs. 25,36,60,425, or Rs. 87,08,635 less than in the previous year; the working expenses amounted to Rs. 12,19,76,875, and absorbed 48.09 per cent. of the gross earnings against 46.19 per cent. in 1895. The net earnings amounted to Rs. 13,16,83,550, being a decrease of Rs. 94,86,650. The statistical return on the capital expenditure was 5.20 per cent. against 5.78 per cent. in the previous year. The new proposals during the year under review were confined to commercial lines, the most important additions being the Hyderabad-Godavari Valley (Hyderabad to Mannād), 389½ miles; Tapti Valley line (Surat to Amalner), 162½ miles; the Sultanpur, Bogra and Kaliganj, 60 miles; and the Mymensingh, Jamalpur and Subhankhali, 63 miles.

J. LUDWIG HEBRAHN, a German archaeologist, has arrived at Oaxaca, Mex., from an extensive exploration trip, covering six months, in the State of Chiapas, which abounds in evidences of a prehistoric race. He reports having discovered another ancient city, situated in the depths of a tropical forest, about sixty miles west of the Guatemalan border. He has with him a number of curious relics of the place, and states that he will go to Germany, where he will endeavour to enlist the services of the Government in sending out an expedition to make a further exploration of the city and that section. The city is partly buried, and is covered with trees of large size and great age.

UNEASINESS has been caused among the manufacturing concerns which flocked a few years ago to the natural-gas belt of Indiana by a recent report of the geologist of that State. The statement in this report that during last year the gas pressure declined 20lb. on an average all over the 2,500 square miles of the field would indicate that the supply is failing very fast, and that manufacturing plants, which are large consumers, cannot be multiplied without hastening the day of complete exhaustion. In this respect the history of the Indiana oil-field will be a repetition of the history of fields previously exploited. The supply is failing everywhere, and few rich finds are rewarding the explorers. As to whether the supply will ever be renewed, geologists differ. It is held by some that the production of gas is a continuous process, as the petroleum constantly oozes from the oil-bearing strata to come in contact with the heated strata which converts it into gas. The Indiana geologist believes, however, that gas-production is an action already completed, and that when the gas fails it is gone for ever.

A competitive examination is to be held by the United States Civil Service Commission, to fill the vacancy in the position of supervising architect to the U.S. Treasury. The salary of this official is 4,500dol. per annum, and the Government hopes that an architect of high attainments and administrative ability may be secured to undertake the duties of this important and responsible post.

Trade News.

WAGES MOVEMENTS.

EDINBURGH AND LEITH MASONS' STRIKE.—Thirty-two masters have now granted the eight hours' day, and of 106 operatives—103 in Edinburgh and three in Leith—who had been working under the old conditions, the majority have ceased work and joined the men on strike. There are about 900 men out of work. A number have left town in search of employment elsewhere. The Masters' Association held a meeting on Tuesday afternoon at 10, Shandwick-place, Edinburgh. Mr. Peter White was in the chair. The meeting was private; but the secretary reported that the masters were still united, as they considered the demand of the men unwarranted, and that, so far as the Association was concerned, there had only been one defection.

HUDDERSFIELD.—END OF THE MASONS' STRIKE.—A meeting of representatives of the masters' and operative masons' associations at Huddersfield was held on Friday, when terms were arrived at. The men agreed to accept an advance of ½d. now and another ½d. in May, 1898, making 8½d. now and 9d. in May, together with a rearrangement of rules. The strike has lasted fourteen weeks. The men will go in on Monday morning, and some important building operations at the new police offices will be resumed. The settlement will afford much relief in other directions.

LIVERPOOL.—The difficulty at present existing between employing and employed plasterers is but little nearer settlement than last week. The employers state that they have, notwithstanding all the efforts put forward to prevent the engagement of non-union plasterers, enough men at work to complete outstanding contracts. They expect the next overture in the direction of arbitration to come from the men, and look to a possible settlement during the coming fortnight.

MUSSELBURGH.—The operative joiners of Musselburgh have received a further advance in their wages of ½d. per hour, as from the beginning of August. The rate is now 9d., the same as in Edinburgh. Hitherto the Musselburgh rate has ruled ½d. under that of Edinburgh.

PAISLEY.—An agreement has been entered into between the masters and operative plumbers in Paisley whereby an increase of wages of ½d. per hour came into force on Monday. The minimum wage is now 9d. per hour, and the working week consists of 51 hours. This is the highest figure ever reached in plumbers' wages in the district.

SOUTH SHIELDS.—The plasterers came out on strike on Saturday last as a protest against the bricklayers doing work which is claimed by the plasterers as their right. For many years past the work of putting down cement flooring such as is used in backyards, stables, sculleries, &c., has been performed by both plasterers and bricklayers, but the plasterers in Shields claim that this work is being done in other districts by plasterers alone, and they further assert that the plasterers' trowel and rule must be used for the job.

CHIPS.

The church of St. James's, Piccadilly, will be closed until the end of September for cleaning and redecoration, under the direction of Sir Arthur Blomfield, and for repair and improvement of the organ.

A Conservative Club is being built at Oxtou from plans by Mr. Frank Holmes. It is two stories in height, and has a bowling-green attached.

In Orchard-street, Neath, new offices are being built for the Neath Rural District Council. Mr. D. M. Davies is the architect, and Messrs. Thomas Watkins and Co. are the builders.

The city engineer of Oxford has submitted to the corporation alternative schemes of £342, £890, and £1,477 to deal with storm waters, which were referred to a committee; £2,000 will be spent on Carfax Tower, excluding the clock, which is to cost £320.

At the monthly meeting of the town council of Newport, Mon., on Tuesday, it was decided that it would be desirable to acquire some property adjacent to the town-hall with the view to carrying out extensions. The price asked for the property is £21,000.

Mr. R. B. Haldane, M.P., opened on Monday Prestonpans Town-hall, recently erected at a cost of £1,500. The building, the plans for which were prepared by Mr. Peter Whitecross, architect, Prestonpans, has a plain exterior, the stone dressings being from Locharbriggs quarry, Dumfriesshire, and the stone of the face-work from Hailes quarry. The main room is entered from a vestibule with glazed screen, is 60ft. by 35ft. in width, and seated for about 450 persons.

CHIPS.

Miss Talbot, of Margam Park, the great church builder in the diocese of Llandaff, has just built a very handsome one dedicated to St. Theodore, at Port Talbot, in memory of Mr. C. R. M. Talbot, M.P., so long the Father of the House of Commons. The Bishop of Llandaff, in consecrating it, on Monday, said that it was one of the handsomest churches in the diocese.

The private view of the Autumn Exhibition at Liverpool will take place on Saturday, August 28, and the inaugural soirée on the following Monday. For the first time the galleries will be illuminated throughout by the electric light.

The town council of Walsall have decided to hold an exhibition of artists' pictures in the art gallery, under the management of Mr. Creswell, of Birmingham, and to set aside £100 a year for the purchase of pictures for the gallery.

The Department of Science and Art has received, through the Foreign Office, a copy of a despatch inclosing a translation of a royal decree for the holding of an exhibition of Spanish industries in the Palace of Arts and Industry, Madrid, this year. The exhibition will be opened on October 20.

At the Airdrie Dean of Guild Court, on Monday, the plans were passed and lining granted of a new Episcopal church to be erected at Springwells, Airdrie. The building will accommodate 200 persons, and will be Gothic in design.

The Home Secretary, Sir M. White Ridley, M.P., opened, on Monday, two new hospital wards that have been added to the Blackpool Hospital, at a cost of £4,000.

A water-supply for Springfield and Gretna Green, which has just been constructed for the Annan District Committee of the Dumfriesshire County Council, was formally opened on Monday. Mr. J. S. Millar has been the contractor.

The Archbishop of York opened, on Tuesday, a new Seamen's Institute on Sandside, Scarborough. The large room on the ground floor is capable of seating 250 people. It is to be used as a recreation room, and also for concerts and temperance meetings. Another room upstairs is used as a reading-room, and an apartment on the ground floor as a coffee bar.

At Tuesday's meeting of the Aston Board of Guardians, a long discussion took place upon the question of the cost of the proposed cottage homes. The Building Committee reported that they had received the detailed estimate for the homes, and had had under consideration a letter from the Local Government Board upon the subject. The total cost would be £50,000, and they recommended that the estimates should be accepted, and that the Local Government Board should be asked to sanction a loan of £39,540, repayable in sixty years, to defray the cost of the building of the structure and the architect's charges; and a further loan of £10,460, repayable in twenty years, to meet the other charges. The report was eventually adopted by a large majority.

In his native town of Shrewsbury, and in front of the school which for nine years he attended, a statue was unveiled on Tuesday in memory of Charles Darwin. It is the work of Mr. Horace Montford, R.A., and represents the naturalist seated in a massive chair, holding some MS. upon which he is engaged, but from which his face is turned as if in deep thought, while at the foot are a number of volumes representing his finished works. The statue, which is of bronze, is the gift of the Shropshire Horticultural Society, and cost 1,000 guineas.

THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2224.

FRIDAY, AUGUST 20, 1897.

THE NEW CULT.

IN his work on "Social Aims," Emerson says, "Next to the originator of a good sentence is the first quoter of it," a truism which finds an exemplification amongst architects and artists generally. We have plenty of "quoters" in architecture and to spare; but they do not always select the best points, and, as the essayist goes on to show, it is as difficult to appropriate the thoughts of others as it is to invent. The new cult of architects and art craftsmen have come to the same conclusion, and they will not "quote" anything; therefore they find little sympathy among the rank and file of the profession, who are content to follow the easiest and safest path, which is the most popular and lucrative. The methods adopted by the "new art cult," if we may so call the advanced school, may not be the most conducive to their success; but at least they have the courage of their convictions, and manage to give offence in many quarters.

Unless they have something fresh to say, theorists and lecturers on art meet with no response. Real art is the same now as it was in the time of the Greeks, and nothing very new can be said about it that is worth remembering. But the fact is that what we call "art" has somewhat changed; what was once real has become only a kind of fashion or convention, and there is therefore an opportunity now and then for some inspired prophet to arise and say plainly how much "art" is fallen. Ruskin many years ago promulgated what appeared to be a new gospel of art, though it was simply a denunciation, almost prophetic in its tone, of what is called modern art, its abuses and conventions. It came like a new revelation to many; in vigorous word-painting he tore off the veil of shams and hypocrisy which obscured the reality of art, and if he said many things which looked extravagant and paradoxical, the object of his writings has been attained in more honest workmanship and sincerity of intention. The same may be said of William Morris, whose writings and work gave an impulse to the workman who had a vocation, till then dormant under a load of shackles. These and a few more stirred the dead bones till a new life began to breathe in them. What these men did simply was to discern the real meaning of art, which till then was a mere fiction and fashion—to strip it of all false ideas and conceptions. And we have a few more of the same kind who are following their example, trying to keep fresh and alive the real faith in art, and prevent it from again being tampered with by those who make profit out of it. Plain speaking is, of course, unpalatable to architects and decorative artists amongst others, who are content to remain in a groove, and it is just for this reason that anything that seems to be a little strange is laughed at. People of this sort are always prating and canting on the intricacies and perplexities of art, inventing fine phrases and terms, and wrapping up their particular art and craft in technical terms, and making it appear more and more difficult to the outsider. They do not like to be told, as Mr. Cobden-Sanderson says in his introductory sketch prefixed to a volume on "Art and Life and the Building and Decoration of Cities," that the "immediate function of art is to do each right thing well, in the spirit of the artist, in the spirit of the whole." The professional architect, or decorator, or carver

thinks his own vocation a more important function than thus described so simply, requiring a knowledge of technical matters, of styles, of art methods; but the above definition of doing each right thing well comprises a good deal more than the ordinary craftsman thinks. He has to discover the *right thing* first of all, which means how to think and adapt, and then to do it well—that is, with the best skill he can command. What has to be guarded against is the thought that any piece of work—a building, a cabinet, a chair, or a scheme of decoration—is necessarily right because it is like something else of the same kind; or because a good model or example has been followed, or because the artist has adopted a traditional method, the work is a "right thing." What is right can only be found out by thinking with an honest intention to do what is true, which may often lead us to a very different result from that which we obtain by the other method. So that this short and simple definition means a great deal more than may be imagined. How does this dictum explain the architect's work? Does he always take a right model or conception of a building? Is it not too often something complex when its use dictates extreme simplicity in plan and elevation? Instead of making a plan that will just suit the requirements, it is more than is wanted. Or he selects a model of a building that is by no means appropriate. Complexity and expense too often force themselves upon him;—its ornamentation and details are borrowed, not genuine expressions of the materials chosen, nor suitable to the purpose or the locality. The engineer has not this temptation. The necessity of absolute utility makes him less liable to go wrong, and neglect the "right thing"; but the architect is for ever being haunted with feelings that his first honest impulses are crude, and in endeavouring to improve his design he loses sight of utility. How many examples of building illustrate this neglect of the dictum "to do each right thing well." If we look at all the labourers' cottages, to take an easy example, how many of them fall short of the absolute simplicity and use demanded! How many of those erected on noblemen's and gentlemen's estates imitate little cottages *orné* or fanciful villas, with such details as carved or pierced bargeboards, bay-window, timber ornamentation. So inside one finds a cramped passage or entrance with stairs in front, no one decently sized family or living room, but a number of closet-like apartments, following the arrangement of a small suburban house suitable for a class above the labourer, but which is ridiculous for a country labourer's family. The whole idea has been to ape the type of better-class villas on a small scale. Even for the city clerk or professional class of small means the suburban house is seldom better. A man with a family of three or five does not want a complete set of small rooms, one with a bay window in front, called almost satirically a "drawing-room," with perhaps a third called a "morning room"; but he wants one good sized sitting-room, and another as a room for receiving visitors, and a few good-sized and ventilated bedrooms. The "right thing" here is certainly not chosen even if the "doing it well" passes muster. In such buildings as almshouses, convalescent homes, village churches, schools, stables, and the like, the same error is common. The village church is pretentious, though small; the architect could not conceive one without a nave and two aisles, a chancel and a tower and spire, and all the adjuncts of a town church; but how ridiculous—it recalls to mind a Bond-street exquisite, top hat and all, climbing an Alpine peak or shooting on the moors. "Quite out of place!" we instinctively exclaim, as we see a dandy in black coat and silk hat on the sands. So it is equally

absurd to find a church built of minster or cathedral-like completeness in a poor and crowded town district or a diminutive Osborne or Balmoral Castle in a London suburb. The "right thing in the right place" has scarcely been learned by the architect of Philistine tendencies; he has to obey orders or the commands of my Lord Snob or my Lady Fashionable. The desire not to be simple or self-evident is one of the weaknesses of modern architecture, and that is why a too-obvious expression is so rarely admired except by the certain "cult" or school of artists we have mentioned. Perhaps the idea that if we made our designs too simple and apparent, the public would think less of the architect's services, has something to do with this opinion. Elaborateness and complexity savour of learning and cleverness; but a very direct way of doing a thing has an air of childish simplicity about it not very congenial to the great Five Per Cent. On the whole, it must be confessed, one of the weak points of mere professionalism in art is the temptation to become fussy and unreal—to appear to be clever or learned; and the same feeling pervades all professions, more or less. Such societies as the Arts and Crafts are direct protests to this exclusive view of art, which makes it appear that only those who have acquired certain professional training or have been apprenticed can turn out artistic work. Mr. Cobden-Sanderson says all men are potentially artists, each in his own degree, and one and all to be capable of co-operating and bringing themselves into unison with "the rhythm of the universe." Latent talent there is undoubtedly in many men, requiring only to be brought out to enable them to take their share. Many an architect can remember instances where he has found a client able to improve on a plan, and of workmen who have made useful suggestions and improved on details of design. They see a thing in a new light, unobscured by those hindrances and prejudices which the professional artist cannot avoid. In this way a bricklayer or a mason sees the obvious and direct way of forming a brick chimney or of setting a stone detail that would never occur to the designer or draughtsman.

The same principle applies to furniture and woodwork. The "right thing" or method of framing a table, a sideboard, or chair is never likely to occur to the ordinary manufacturer or designer of these articles. His head is full of the technical methods in use, the "properties" of his craft, beads and reels, mouldings, and other survivals of past styles. He looks through volumes of designs by various schools and makers, modern pattern books in Curtain-road; but he neglects the main question of right and wrong. To tell him that real art is not in these things, but in thinking how he ought to frame to give the utmost convenience with effective strength, how to dress his wood to set off its figure, where he ought to mould or carve, is to deceive him. It may be only a limited kind of art, the exercise of common sense in handicraft; but it is art all the same, in doing work well. As a matter of fact, the question which weighs with the ordinary craftsman is not *How* a certain thing should be done, but *How it is done*, and what people look for. They expect a certain class of goods turned out a certain way. If they see a chair that is really comfortable to sit in, and looks plain and straightforward, they pooh-pooh it; but if it follows a pattern of Chippendale or Sheraton, it must be right—so powerful is the influence of conventional tradition. "Peculiar," "stiff," "horribly plain," "a fad," are terms which people of this kind apply to all independent effort to do things in a reasonable and artistic manner, and the only way is to point the maxim as often as possible. In decoration it is just the same: it is not the right thing that is wanted so much, but what looks *chic* to Mr. Brown or Mr. Smith,

who have an immense dislike to anything eccentric or that looks peculiar; and this is the prejudice which the architect has to fight against and try to overcome. It claims attention in politics, theology, opinions about all matters; until the thin crust of prejudice and ignorance is broken through, people will stick to their old ideas, and they will hail the new only when it becomes popular.

Our art schools have been trying to inculcate the same principle of reliance or independent thought, but what they have tried to do with one hand they have rendered abortive with another. How can a student design anything original in ironwork hangings or wall decoration when he has to surfeit his eyes on patterns and conventions of the most stereotyped kind? Nor, if we take the designs awarded medals at the National Competition, do we see that he is encouraged much for any effort in this direction: the youth who can draw and repeat mechanically has the best chance of winning. The general complaint made by examiners shows how little material and appropriateness are considered. Thus, in one subject, designs are made without reference to the material; in another instance, a design for a tablecloth with a border does not indicate that the latter hangs down, indeed the pattern would equally serve the purpose of ridge-cresting; and in other instances folial patterns are upside down, and animals on their heads. Fundamental principles of decoration, whether for wall surfaces, for hangings, for iron and metal, for faience, never occur to students who have been instructed according to examples, not to have notions.

The only hope for a better state of things will depend on the success which awaits those who are trying to revert to the primary principles of art. A few of the more educated among those who patronise art are beginning to see that good art lies far below the surface; that it extends to good construction, to technical qualities, to materials and workmanship—all of which have to be fashioned by the exercise of common-sense and taste. We have had too much theorising and lecturing to little purpose by men who have only touched the fringe of their subjects—who have entirely missed the main question. The public monuments of our streets, our sculpture, the design of our fountains, our seats, the laying out of open spaces, even our railings, lamps, and lamp-pillars, all show how much we are still under the control of the manufacturer and the commercial designer.

WALLS BELOW BRESSUMMERS.

THE question whether a wall of a building erected in the Metropolis is to be of the statutory thickness below a bressummer which carries the upper part is one of importance to all builders and architects. The facts of a case were reported in our last issue. A builder of Walworth appealed against a notice of objection made by Mr. Ellis Marsland, M.S.A., the district surveyor, having reference to the thickness of the external walls of the basement of a public-house which was being rebuilt at Peckham. The district surveyor claimed that the wall in question should be 17½ in. thick for the basement story in accordance with the schedule, it being in his view a wall 43 ft. in height. On the contrary, it was contended for the appellant that it was not a basement wall in this sense—that section 56 of the Act which dealt with bressummers showed an entirely different state of things had to be considered where a bressummer was used. It was argued that the wall began with the bressummer, and not with the basement. While the district surveyor said the thickness of the wall had to be regulated by its height taken from the basement; the appellant, on the other hand,

contended that the height should be taken from the bressummer. It will be seen the plea set up was a rather plausible one, and sought by reducing the height of wall to reduce its thickness. Indeed, it is such a plea that might occur to any builder. Between the ground-floor level and the bressummer there is practically no wall, it being occupied by the shop-front. Then why make the lower portion of the basement wall so thick? It has no weight on it. But did the Act contemplate this case? The only provision referring to it is section 7 of the First Schedule (preliminary), which runs as follows:—"For the purpose of determining the thickness of a wall, the height of such wall shall be measured from the base of the wall to the top of the topmost story, whether such wall is carried to the full height or not; or in case of a gable, when there are no stories on the roof, to half the height of the gable." Now the question occurs, What is the meaning to be attached to the "base of the wall"? Certainly the framers of the Act could have had no other idea than that of the "base" defined in the Act. Turning to which, we read the following definition:—"The expression 'base' applied to a wall means the underside of the course immediately above the footings [if any, or in the case of a wall carried by a bressummer, above such bressummer]." The part within brackets is the new matter in the repealed Act. The framers of the new Act, therefore, had in contemplation a wall carried by a bressummer as well. They, therefore, thought of two bases, but not belonging to the same wall. In the case before the magistrate there was a basement wall 14 in. thick, called by the architect "a retaining wall" only, which might be regarded as included in the height of the wall above the bressummer. This is the view the magistrate took. Mr. Hopkins asked "Why a wall is less a wall within the statute because half-way up, it may be, there is a bressummer?" The reply to this was that "Because the height of the wall has to be measured from the base—and the base of the wall in this case was from the bressummer." Here was the point at issue. While the appellant said the basement wall was only a retaining wall, the magistrate held it to be the wall of the building which came under the statute. It was argued, on the other hand, that there cannot be two bases to the same wall—that the basement wall did not go higher than the surface of ground. The magistrate said he was not dealing with anything above the bressummer, but with the wall below, and which carries the bressummer, and upon this ground he dismissed the appeal.

If our readers have followed the argument they will at once see on what ground the magistrate decided for the district surveyor's view. It was, in fact, one wall from the basement to the topmost story; and if there was a large vacant space or shop-front bridged over by a bressummer, it was an accident. The wall had to be measured through the bressummer, and the second base was not considered. And no doubt this is a reasonable view when we consider one possibility, though it did not occur to the parties. Suppose, for instance, the owner of the building one day turns the shop into an office, or a dwelling-house, and builds up with brick the shop-front opening, and removes the bressummer. It would then be one wall from top to bottom. The 14 in. basement wall would not be sufficient, or, at least, it would then be clearly contrary to the statutory thickness. Therefore, it is safe to look at the wall of basement as a part of the wall above the bressummer. Section 56 of the Act, relied on by the appellant, which deals with "rules as to bressummers," does not materially alter matters. It merely refers to the bearing of beams of this kind upon piers of brick or stone, or upon story-

posts fixed on a solid foundation. If such piers had been brought up independently from such a foundation to carry the bressummer, no doubt the finding would have been different.

One important thing about the case is that it points to a rather debatable subject. The provisions of the Act are certainly wanting in precision. The section we have quoted might have been worded in such a manner as to leave no doubt whatever as to where the height of a wall was to be taken from when a basement wall below a bressummer or shop-front was shown. The question may occur again, Can there be two bases to the same wall? It would be easy for a builder to argue that the base of a wall carried on a girder some feet from the ground is from the girder. Ingenious devices to support walls may be invented which, interpreted by the definition clause of "base," would lead to some trouble. The statutory definition of "base" is ambiguous: it may mean one of two things—either a base above a footing, or a base above a bressummer. It cannot mean both. The schedule of thicknesses applies to the height of wall above a foundation, and therefore it is necessary to take the former meaning. Those who make designs for new buildings or for alterations will do well to bear in mind the decision that has been given. It would be interesting to know positively if any walls had been built, as it was hinted, contrary to this rule, on the understanding that the height in such cases was taken from the bressummer instead of from the basement. There can be little doubt that when the clause (sect. 7 of the first schedule) was framed, the words "measured from the base of the wall, &c.," were intended in every case to mean the base above the foundation, and that any doubt must have arisen from the definition which speaks of another base. The facts as related in the court afford another instance of the very great importance to be attached to definitions in building Acts;—how often they have rendered a section intended to mean a certain thing nugatory.

BRITISH ASSOCIATION OF SCIENCE AT TORONTO.

PRESIDENT'S ADDRESS—ARCHÆOLOGY AS A SCIENCE.

SIR JOHN EVANS, the president, in his address at Toronto, on Wednesday, said: It appears to me that my election to this important post may, in the main, be regarded as a recognition by this association of the value of archæology as a science. Leaving all personal considerations out of question, I gladly hail this recognition, which is, indeed, in full accordance with the attitude already for many years adopted by the association towards anthropology, one of the most important branches of true archæology. It is no doubt hard to define the exact limits which are to be assigned to

ARCHÆOLOGY AS A SCIENCE

and archæology as a branch of history and belles lettres. It must, however, be acknowledged that a distinction does exist between archæology proper, and what, for want of a better word, may be termed antiquarianism. It may be interesting to know the internal arrangements of a Dominican convent in the middle ages; to distinguish between the different mouldings characteristic of the principal styles of Gothic architecture; to determine whether an English coin bearing the name of Henry was struck under Henry II., Richard, John, or Henry III., or to decide whether some given edifice was erected in Roman, Saxon, or Norman times. But the power to do this, though involving no small degree of detailed knowledge and some acquaintance with scientific methods, can hardly entitle its possessors to be enrolled among the votaries of science. A familiarity with all the details of Greek and Roman mythology and culture must be regarded as a literary rather than a scientific qualification; and yet, when among the records of classical times we come upon traces of manners and customs which have survived for generations, and

which seem to throw some rays of light upon the dimpast, when history and writing were unknown, we are, I think, approaching the boundaries of scientific archaeology. Every reader of Virgil knows that the Greeks were not merely orators, but that with a pair of compasses they could describe the movements of the heavens and fix the rising of the stars; but when by modern astronomy we can determine the heliacal rising of some well-known star, with which the worship in some given ancient temple is known to have been connected, and can fix its position on the horizon at some particular spot, say, 3,000 years ago, and then find that the axis of the temple is directed exactly towards that spot, we have some trustworthy scientific evidence that the temple in question must have been erected at a date approximately 1,100 years B.C. If on or close to the same site we find that more than one temple was erected, each having a different orientation, these variations, following as they may fairly be presumed to do the changing position of the rising of the dominant star, will also afford a guide as to the chronological order of the different foundations. The researches of Mr. Penrose seem to show that in certain Greek temples, of which the date of foundation is known from history, the actual orientation corresponds with that theoretically deduced from astronomical data. Sir J. Norman Lockyer has shown that what holds good for Greek temples applies to many of far earlier date in Egypt, though up to the present time hardly a sufficient number of accurate observations have been made to justify us in foreseeing all the instructive results that may be expected to arise from astronomy coming to the aid of archaeology. The intimate connection of archaeology with other sciences is in no case so evident as with respect to geology, for, when considering subjects such as those I shall presently discuss, it is almost impossible to say where the one science ends and the other begins. When we come to discuss that remote age in which we find the earliest traces that are at present known of man's appearance upon earth, the aid of geology and palæontology becomes absolutely imperative. The changes in the surface configuration and in the extent of the land, especially in a country like Britain, as well as the modifications of the fauna and flora since those days, have been such that the archaeologist pure and simple is incompetent to deal with them, and he must either himself undertake the study of these other sciences or call experts in them to his assistance. The evidence that man had already appeared upon the earth is afforded by stone implements wrought by his hands, and it falls strictly within the province of the archaeologist to judge whether given specimens were so wrought or not; it rests with the geologist to determine their stratigraphical or chronological position, while the palæontologist can pronounce upon the age and character of the associated fauna and flora. If left to himself the archaeologist seems too prone to build up theories founded upon form alone, irrespective of geological conditions. The geologist, unaccustomed to archaeological details, may readily fail to see the difference between the results of the operations of nature and those of art, and may be liable to trace the effects of man's handiwork in the chipping, bruising, and wearing which in all ages result from natural forces; but the united labours of the two, checked by those of the palæontologist, cannot do otherwise than lead towards sound conclusions. It will, perhaps, be expected of me that I should on the present occasion bring under review the state of our present knowledge with regard to

THE ANTIQUITY OF MAN;

and probably no fitter place could be found for the discussion of such a topic than the adopted home of my venerated friend, the late Sir Daniel Wilson, who first introduced the word "prehistoric" into the English language. Some among us may be able to call to mind the excitement, not only among men of science, but among the general public, when, in 1859, the discoveries of M. Boucher de Perthes and Dr. Rigollot in the gravels of the valley of the Somme, at Abbeville and Amiens, were confirmed by the investigations of the late Sir Joseph Prestwich, myself, and others, and the co-existence of man with the extinct animals of the Quaternary fauna, such as the mammoth and woolly-haired rhinoceros, was first virtually established. It was at the same time pointed out that these relics belonged to a far earlier date than the ordinary stone weapons found upon the surface, which usually showed signs of grinding or polishing, and that, in fact,

there were two Stone Ages in Britain. To these the terms Neolithic and Palæolithic were subsequently applied by Sir John Lubbock. The excitement was not less, when, at the meeting of this association at Aberdeen in the autumn of that year, Sir Charles Lyell, in the presence of the Prince Consort, called attention to the discoveries in the valley of the Somme, the site of which he had himself visited, and to the vast lapse of time indicated by the position of the implements in drift-deposits 100ft. above the existing river. The conclusions forced upon those who examined the facts on the spot did not receive immediate acceptance by all who were interested in geology and archaeology, and fierce were the controversies on the subject that were carried on both in the newspapers and before various learned societies. It is at the same time instructive and amusing to look back on the discussions of those days. While one class of objectors accounted for the configuration of the flint implements from the gravels by some unknown chemical agency, by the violent and continued gyratory action of water, by fracture resulting from pressure, by rapid cooling when hot or by rapid heating when cold, or even regarded them as aberrant forms of fossil fishes, there were others who, when compelled to acknowledge that the implements were the work of men's hands, attempted to impugn and set aside the evidence as to the circumstances under which they had been discovered. In doing this they adopted the view that the worked flints had either been introduced into the containing beds at a comparatively recent date, or, if they actually formed constituent parts of the gravel, then that this was a mere modern alluvium resulting from floods at no very remote period. In the course of a few years the main stream of scientific thought left this controversy behind, though a tendency to cut down the lapse of time necessary for all the changes that have taken place in the configuration of the surface of the earth and in the character of its occupants since the time of the palæolithic gravels, still survives in the inmost recesses of the hearts of not a few observers. In his address to this association at the Bath meeting of 1864, Sir Charles Lyell struck so true a note that I am tempted to reproduce the paragraph to which I refer:—"When speculations on the long series of events which occurred in the Glacial and post-Glacial periods are indulged in, the imagination is apt to take alarm at the immensity of the time required to interpret the monuments of these ages, all referable to the era of existing species. In order to abridge the number of centuries which would otherwise be indispensable, a disposition is shown by many to magnify the rate of change in prehistoric times by investing the causes which have modified the animate and inanimate world with extraordinary and excessive energy. It is related of a great Irish orator of our day that when he was about to contribute somewhat parsimoniously towards a public charity he was persuaded by a friend to make a more liberal donation. In doing so he apologised for his apparent want of generosity by saying that his early life had been a constant struggle with scanty means, and that 'they who are born to affluence cannot easily imagine how long a time it takes to get the chill of poverty out of one's bones.' In like manner, we of the living generation, when called upon to make grants of thousands of centuries in order to explain the events of what is called the modern period, shrink naturally at first from making what seems so lavish an expenditure of past time. Throughout our early education we have been accustomed to such strict economy in all that relates to the chronology of the earth and its inhabitants in remote ages, so fettered have we been by old traditional beliefs that, even when our reason is convinced, and we are persuaded that we ought to make more liberal grants of time to the geologist, we feel how hard it is to get the chill of poverty out of our bones." Many, however, have at the present day got over this feeling, and of late years the general tendency of those engaged upon the question of the antiquity of the human race has been in the direction of seeking for evidence by which the existence of man upon the earth could be carried back to a date earlier than that of the Quaternary gravels. There is little doubt that such evidence will eventually be forthcoming; but, judging from all probability, it is not in Northern Europe that the cradle of the human race will eventually be discovered; but, in some part of the world more favoured by a Tropical climate, where abundant means of subsistence could be procured, and where the necessity for

warm clothing did not exist. Before entering into speculations on this subject, or attempting to lay down the limits within which we may safely accept recent discoveries as firmly established, it will be well to glance at some of the cases in which implements are stated to have been found under circumstances which raise a presumption of the existence of man in pre-Glacial, Pliocene, or even Miocene times. Flint implements of ordinary Palæolithic type have, for instance, been recorded as found in the Eastern Counties of England, in beds beneath the chalky boulder clay; but, on careful examination the geological evidence has not to my mind proved satisfactory, nor has it, I believe, been generally accepted. Moreover, the archaeological difficulty that man, at two such remote epochs as the pre-Glacial and the post-Glacial, even if the term glacial be limited to the chalky boulder clay, should have manufactured implements so identical in character that they cannot be distinguished apart, seems to have been entirely ignored. Within the last few months we had the report of worked flints having been discovered in the Late Pliocene forest bed of Norfolk; but in that instance the signs of human workmanship upon the flints are by no means apparent to all observers. But such an antiquity as that of the forest bed is as nothing when compared with that which would be implied by the discoveries of the work of men's hands in the Pliocene and Miocene beds of England, France, Italy, and Portugal, which have been accepted by some geologists. There is one feature in these cases which has hardly received due attention, and that is the isolated character of the reputed discoveries. Had man, for instance, been present in Britain during the Crag period, it would be strange indeed if the sole traces of his existence that he left were a perforated tooth of a large shark, the sawn rib of a manatee, and a beaming full face, carved on the shell of a pectenulus. In an address to the Anthropological section at the Leeds meeting of the Association in 1890 I dealt somewhat fully with these supposed discoveries of the remains of human art in beds of Tertiary date; and I need not here go further into the question. Suffice it to say that I see no reason why the verdict of "Not proven" at which I then arrived should be reversed. In the case of a more recent discovery in Upper Burma in beds at first pronounced to be Upper Miocene, but subsequently "definitely ascertained to be Pliocene," some of the flints are of purely natural and not artificial origin, so that two questions arise:—1st, Were the fossil remains associated with the worked flints or with those of natural forms? And second, Were they actually found in the bed to which they have been assigned, or did they merely lie together on the surface? Even the *Pithecanthropus erectus* of Dr. Eugene Dubois from Java meets with some incredulous objectors from both the physiological and the geological sides. From the point of view of the latter the difficulty lies in determining the exact age of what are apparently alluvial beds in the bottom of a river valley. When we return to Palæolithic man, it is satisfactory to feel that we are treading on comparatively secure ground, and that the discoveries of the last forty years in Britain alone enable us to a great extent to reconstitute his history. We may not know the exact geological period when first he settled in the British area, but we have good evidence that he occupied it at a time when the configuration of the surface was entirely different from what it is at present; when the river valleys had not been cut down to anything like their existing depth, when the fauna of the country was of a totally different character from that of the present day, when the extension of the southern part of the island seaward was in places such that the land was continuous with that of the continent, and when in all probability a far more rainy climate prevailed. We have proofs of the occupation of the country by man during the long lapse of time that was necessary for the excavation of the river valleys. We have found the old floors on which his habitations were fixed, we have been able to trace him at work on the manufacture of flint instruments, and by building up the one upon the other the flakes struck off by the primeval workman in those remote times we have been able to reconstruct the blocks of flint which served as his material. That the duration of

THE PALÆOLITHIC PERIOD

must have extended over an almost incredible length of time is sufficiently proved by the fact

that valleys, some miles in width and of a depth of from 100 to 150ft., have been eroded since the deposit of the earliest implement-bearing beds. Nor is the apparent duration of this period diminished by the consideration that the floods which hollowed out the valleys were not in all probability of such frequent occurrence as to teach Palaeolithic man by experience the danger of settling too near to the streams, for had he kept to the higher slopes of the valley there would have been but little chance of his implements having so constantly formed constituent parts of the gravels deposited by the floods. The examination of British cave-deposits affords corroborative evidence of this extended duration of the Palaeolithic Period. In Kent's cavern at Torquay, for instance, we find in the lowest deposit, the breccia below the red cave-earth, implements of flint and chert corresponding in all respects with those of the high level and most ancient river gravels. In the cave-earth these are scarcer, though implements occur which also have their analogues in the river deposits; but, what is more remarkable, harpoons of reindeer's horn and needles of bone are present, identical in form and character with those of the caverns of the Reindeer Period in the South of France, and suggestive of some bond of union or identity of descent between the early troglodytes, whose habitations were geographically so widely separated the one from the other. In a cavern at Cresswell Crags on the confines of Derbyshire and Nottinghamshire, a bone has moreover been found engraved with a representation of parts of a horse in precisely the same style as the engraved bones of the French caves. It is uncertain whether any of the River-drift specimens belong to so late a date as these artistic cavern-remains; but the greatly superior antiquity of even these to any Neolithic relic is testified by the thick layer of stalagmite, which had been deposited in Kent's Cavern before its occupation by men of the Neolithic and Bronze Periods. Towards the close of the period covered by the human occupation of the French caves, there seems to have been a dwindling in the number of the larger animals constituting the Quaternary fauna, whereas their remains are present in abundance in the lower, and therefore more recent, of the valley gravels. This circumstance may afford an argument in favour of regarding the period represented by the later French caves as a continuation of that during which the old river gravels were deposited, and yet the great change in the fauna that has taken place since the latest of the cave-deposits included in the Palaeolithic Period is indicative of an immense lapse of time. How much greater must have been the time required for the more conspicuous change between the old Quaternary fauna of the river gravels and that characteristic of the Neolithic Period! As has been pointed out by Professor Boyd Dawkins, only thirty-one out of the forty-eight well-ascertained species living in the post-Glacial or River-drift Period survived into prehistoric or Neolithic times. We have not, indeed, any means at command for estimating the number of centuries which such an important change indicates; but when we remember that the date of the commencement of the Neolithic or Surface Stone Period is still shrouded in the mist of a dim antiquity, and that prior to that commencement the River-drift Period had long come to an end; and when we further take into account the almost inconceivable ages that, even under the most favourable conditions, the excavation of wide and deep valleys by river action implies, the remoteness of the date at which the Palaeolithic Period had its beginning almost transcends our powers of imagination. We find distinct traces of river action from 100ft. to 200ft. above the level of existing streams and rivers, and sometimes at a great distance from them; we observe old fresh-water deposits on the slopes of valleys several miles in width; we find that long and lofty escarpments of rock have receded unknown distances since their summits were first occupied by Palaeolithic man; we see that the whole side of a wide river-valley has been carried away by an invasion of the sea, which attacked and removed a barrier of chalk cliffs from 400ft. to 600ft. in height; we find that what was formerly an inland river has been widened out into an arm of the sea, now the highway of our fleets; and that gravels which were originally deposited in the bed of some ancient river now cap isolated and lofty hills. And yet, remote as the date of the first known occupation of Britain by man may be, it belongs to what,

geologically speaking, must be regarded as a quite recent period, for we are now in a position to fix, with some degree of accuracy, its place on the geological scale. Thanks to investigations ably carried out at Hoxne in Suffolk, and at Hitchin in Hertfordshire, by Mr. Clement Reid, under the auspices of this Association and of the Royal Society, we know that the implement-bearing beds at those places undoubtedly belong to a time subsequent to the deposit of the great chalky boulder clay of the Eastern Counties of England. It is, of course, self-evident that this vast deposit, in whatever manner it may have been formed, could not, for centuries after its deposition was complete, have presented a surface inhabitable by man. Moreover, at a distance but little farther north, beds exist which also, though at a somewhat later date, were apparently formed under Glacial conditions. At Hoxne, the interval between the deposit of the boulder clay and of the implement-bearing beds is distinctly proved to have witnessed at least two noteworthy changes in climate. The beds immediately reposing on the clay are characterised by the presence of alder in abundance, of hazel, and yew, as well as by that of numerous flowering plants indicative of a temperate climate very different from that under which the boulder clay itself was formed. Above these beds, characterised by temperate plants, comes a thick and more recent series of strata, in which leaves of the dwarf Arctic willow and birch abound, and which were in all probability deposited under conditions like those of the cold regions of Siberia and North America. At a higher level and of more recent date than these—from which they are entirely distinct—are the beds containing Palaeolithic implements, formed in all probability under conditions not essentially different from those of the present day. However this may be, we have now conclusive evidence that the Palaeolithic implements are, in the Eastern Counties of England, of a date long posterior to that of the great chalky boulder clay. It may be said, and said truly, that the implements at Hoxne cannot be shown to belong to the beginning rather than to some later stage of the Palaeolithic Period. The changes, however, that have taken place at Hoxne in the surface configuration of the country prove that the beds containing the implements cannot belong to the close of that period. It must, moreover, be remembered that in what are probably the earliest of the Palaeolithic deposits of the Eastern Counties, those at the highest level, near Brandon in Norfolk, where the gravels contain the largest proportion of pebbles derived from glacial beds, some of the implements themselves have been manufactured from materials not native to the spot, but brought from a distance, and derived in all probability either from the boulder clay or from some of the beds associated with it. We must, however, take a wider view of the whole question, for it must not for a moment be supposed that there are the slightest grounds for believing that the civilisation, such as it was, of the Palaeolithic Period originated in the British Isles. We find in other countries implements so identical in form and character with British specimens, that they might have been manufactured by the same hands. These occur over large areas in France under similar conditions to those that prevail in England. The same forms have been discovered in the ancient river-gravels of Italy, Spain, and Portugal. Some few have been recorded from the north of Africa, and analogous types occur in considerable numbers in the south of that continent. On the banks of the Nile, many hundreds of feet above its present level, implements of the European types have been discovered; while in Somaliland, in an ancient river valley at a great elevation above the sea, Mr. Seton-Karr has collected a large number of implements formed of flint and quartzite, which, judging from their form and character, might have been dug out of the drift deposits of the Somme or the Seine, the Thames or the ancient Solent. In the valley of the Euphrates implements of the same kind have also been found, and again farther east in the lateritic deposits of Southern India they have been obtained in considerable numbers. It is not a little remarkable, and is at the same time highly suggestive, that a form of implement almost peculiar to Madras reappears among implements from the very ancient gravels of the Manzanares at Madrid. In the case of the African discoveries we have as yet no definite Palaeontological evidence by which to fix their antiquity, but in the Narbadá Valley of

Western India Palaeolithic implements of quartzite seem to be associated with a local fauna of Pleistocene age, comprising, like that of Europe, the elephant, hippopotamus, ox, and other mammals of species now extinct. A correlation of the two faunas with a view of ascertaining their chronological relations is beset with many difficulties, but there seems reason for accepting this Indian Pleistocene fauna as in some degree more ancient than the European. Is this not a case in which the imagination may be fairly invoked in aid of science? May we not from these data attempt in some degree to build up and reconstruct the early history of the human family? There, in Eastern Asia, in a tropical climate, with the means of subsistence readily at hand, may we not picture to ourselves our earliest ancestors gradually developing from a lowly origin, acquiring a taste for hunting, if not, indeed, being driven to protect themselves from the beasts around them, and evolving the more complicated forms of tools or weapons from the simpler flakes which had previously served them as knives? May we not imagine that, when once the stage of civilisation denoted by these Palaeolithic implements had been reached, the game for the hunter became scarcer, and that his life in consequence assumed a more nomad character? Then—and possibly not till then—may a series of migrations to "fresh woods and pastures new" not unnaturally have ensued, and these following the usual course of "westward towards the setting sun," might eventually lead to a Palaeolithic population finding its way to the extreme borders of Western Europe, where we find such numerous traces of its presence. How long a term of years may be involved in such a migration it is impossible to say; but that such a migration took place the phenomena seem to justify us in believing. It can hardly be supposed that the process that I have shadowed forth was reversed, and that man, having originated in North-Western Europe, in a cold climate where clothing was necessary and food scarce, subsequently migrated eastward to India, and southward to the Cape of Good Hope! As yet, our records of discoveries in India and Eastern Asia are but scanty; but it is there that the traces of the cradle of the human race are, in my opinion, to be sought, and possibly future discoveries may place upon a more solid foundation the visionary structure that I have ventured to erect. It may be thought that my hypothesis does not do justice to what Sir Thomas Browne has so happily termed "that great antiquity, America." I am, however, not here immediately concerned with the important Neolithic remains of all kinds with which this great continent abounds. I am now confining myself to the question of Palaeolithic man and his origin, and in considering it I am not unmindful of the Trenton implements, though I must content myself by saying that the "turtle-back" form is essentially different from the majority of those on the wide dissemination of which I have been speculating, and, moreover, as many here present are aware, the circumstances of the finding of these American implements are still under careful discussion. Leaving them out of the question for the present, it may be thought worth while to carry our speculations rather further, and to consider the relations in time between the Palaeolithic and the Neolithic periods. We have seen that the stage in human civilisation denoted by the use of the ordinary forms of Palaeolithic implements must have extended over a vast period of time if we have to allow for the migration of the primeval hunters from their original home, wherever it may have been in Asia or Africa, to the west of Europe, including Britain. We have seen that, during this migration, the forms of the weapons and tools made from silicious stones had become, as it were, stereotyped, and further, that, during the subsequent extended period implied by the erosion of the valleys, the modifications in the form of the implements and the changes in the fauna associated with the men who used them were but slight. At the close of the period during which the valleys were being eroded comes that represented by the latest occupation of the caves by Palaeolithic man, when both in Britain and in the south of France the reindeer was abundant; but among the stone weapons and implements of that long troglodytic phase of man's history not a single example with the edge sharpened by grinding has as yet been found. All that can safely be said is that the larger implements as well as the larger mammals had become scarcer, that greater power in

chipping flint had been attained, that the arts of the engraver and the sculptor had considerably developed, and that the use of the bow had probably been discovered. Directly we encounter the relics of the Neolithic Period, often, in the case of the caves lately mentioned, separated from the earlier remains by a thick layer of underlying stalagmite, we find flint hatchets polished at the edge and on the surface, cutting at the broad and not at the narrow end, and other forms of implements associated with a fauna in all essential respects identical with that of the present day. Were the makers of these polished weapons the direct descendants of Palæolithic ancestors whose occupation of the country was continuous from the days of the old river gravels? or had these long since died out, so that after Western Europe had for ages remained uninhabited, it was re-peopled in Neolithic times by the immigration of some new race of men? Was there, in fact, a "great gulf fixed" between the two occupations? or was there in Europe a gradual transition from the one stage of culture to the other? So far as I know we have as yet no trustworthy evidence of any transition from the one age to the other, and the gulf between them remains practically unbridged. We can, indeed, hardly name the part of the world in which to seek for the cradle of Neolithic civilisation, though we know that traces of what appear to have been a stone-using people have been discovered in Egypt, and that what must be among the latest of the relics of their industry have been assigned to a date some 3,500 to 4,000 years before our era. The men of that time had attained to the highest degree of skill in working flint that has ever been reached. Their beautifully-made knives and spear-heads seem indicative of a culminating point reached after long ages of experience; but whence these artists in flint came or who they were is at present absolutely unknown, and their handiworks afford no clue to help us in tracing their origin. Taking a wider survey, we may say that, generally speaking, not only the fauna but the surface configuration of the country were, in Western Europe at all events, much the same at the commencement of the Neolithic Period as they are at the present day. We have, too, no geological indications to aid us in forming any chronological scale. The occupation of some of the caves in the South of France seems to have been carried on after the erosion of the neighbouring river valleys had ceased, and so far as our knowledge goes, these caves offer evidence of being the latest in time of those occupied by man during the Palæolithic period. It seems barely possible that, though in the North of Europe there are no distinct signs of such late occupation, yet that, in the South, man may have lived on, though in diminished numbers; and that in some of the caves, such, for instance, as those in the neighbourhood of Mentone, there may be traces of his existence during the transitional period that connects the Palæolithic and Neolithic Ages. If this were really the case, we might expect to find some traces of a dissemination of Neolithic culture from a North Italian centre; but I much doubt whether any such traces actually exist. If it had been in that part of the world that the transition took place, how are we to account for the abundance of polished stone hatchets found in Central India? Did Neolithic man return eastward by the same route as that by which, in remote ages, his Palæolithic predecessor had migrated westward? Would it not be in defiance of all probability to answer such a question in the affirmative? We have, it must be confessed, nothing of a substantial character to guide us in these speculations; but, pending the advent of evidence to the contrary, we may, I think, provisionally adopt the view that owing to failure of food, climatal changes, or other causes, the occupation of Western Europe by Palæolithic man absolutely ceased, and that it was not until after an interval of long duration that Europe was re-peopled by a race of men immigrating from some other part of the globe where the human race had survived, and in course of ages had developed a higher stage of culture than that of Palæolithic man. I have been carried away by the liberty allowed for conjecture into the regions of pure imagination, and must now return to the realms of fact, and one fact on which I desire for a short time to insist is that of the existence at the present day, in close juxtaposition with our own civilisation, of races of men, who, at all events but a few generations ago, lived under much the same conditions as did our own Neolithic predecessors in Europe. The manners

and customs of these primitive tribes and peoples are changing day by day: their languages are becoming obsolete, their myths and traditions are dying out, their ancient processes of manufacture are falling into oblivion, and their numbers are rapidly diminishing, so that it seems inevitable that ere long many of these interesting populations will become absolutely extinct.

LONDON BOARD SCHOOL BUILDINGS.

THE annual report of the Works Committee of the London School Board gives an abstract of the work done during the year ended March 25. The committee, after referring to the acquisition of 10 sites for new schools and additional land for 46 existing schools with regard to which compulsory powers were obtained in 1895-96, report that in the past year it had been decided to schedule 20 sites for new schools and additional land for enlarging 25 existing schools or playgrounds or for the purpose of carrying out general improvements. In some cases, however, the sites and the land had since been omitted from the schedule. During the year the Board agreed to purchase various interests in sites, at a cost of £116,561 13s., the surveyors' fees amounting to £659 19s. 6d. The value of all the sites purchased or agreed to be purchased previous to March last was £3,222,412, and the costs £430,621. According to a table prepared by the finance department, the cost of the sites for 325 schools, the accounts for which had been completed at September 29, 1896, was £6 11s. 10d. per child, and the average cost per head of the school buildings was £13 14s. 1d., and of the furniture and fittings 10s. 7d. Up to Lady Day, 1896, the total number of permanent schools which had been erected and opened was 409; and during the year under review nine additional schools and 15 enlargements were opened. The nine new schools were erected—one in Finsbury, one in Greenwich, one in Hackney, one in East Lambeth, two in West Lambeth, one in Southwark, and two in Tower Hamlets. The total accommodation provided was for 8,072 children, and the cost of sites, buildings, and furniture was set down at £237,875 12s. 6d., or an average cost per head of £29 9s. 4d. The enlargements were carried out in Chelsea, Greenwich, Hackney, East Lambeth, West Lambeth, Southwark, and Tower Hamlets. They provided additional accommodation for 4,761 children at a cost of £98,787, or an average cost per head of £20 14s. 11d. Loans were authorised by the Education Department in respect of the nine new schools and sites amounting to £239,527, and on account of the 15 enlargements and sites amounting to £131,202.

As to future provision of schools, tenders were accepted during the year for erecting nine new schools—one in Chelsea, two in Finsbury, two in Hackney, two in West Lambeth, one in Marylebone, and one in Westminster—giving accommodation for 9,968 children, at a cost of £170,936, or £17 2s. 11d. average cost per head. Tenders were also accepted for eight enlargements—one in Greenwich, one in East Lambeth, one in West Lambeth, two in Southwark, and three in Tower Hamlets—to accommodate 2,696 children at a cost of £69,832, or £25 18s. per head. With regard to the new schools, each will be provided with a hall for each department, which was not counted in the accommodation of the school, and the tenders included the provision of centres for cookery, laundry, manual training, or special instruction, and in eight cases a drawing classroom. As to the enlargements, the variation in cost arose mainly from the fact that in enlarging the buildings the opportunity was taken to improve the existing schools so as to make them thoroughly efficient, and in some cases centres were added. Tenders had also been accepted for providing 12 cookery centres, 14 laundry centres, 18 manual training centres, seven schools for special instruction, rooms for upper standards at three existing schools, extending a chemical laboratory, providing covered playgrounds at three schools, carrying out drainage and sanitary works to 29 schools, and for other works. The total amount of the tenders for sanitary work at 24 of these schools was £32,398.

In their last report it was stated that the committee were considering the whole question as to the cost of the schools and that they had appointed a sub-committee to consider the subject. This committee recommended, with the view of reducing the cost, that, among other things, the

Board should revert to the old specification in force in 1885-86 for the next six schools, subject to certain modifications; and the Board had sanctioned the experiment. Among the other works referred to, the committee state that the proposed deaf institution at Anerley, for which a tender had been accepted for £38,920, had been abandoned because the Education Department had declined to approve of the plans. The industrial school for girls at Isleworth would soon be ready for occupation. Homerton Training College had been purchased and would be used for temporary school accommodation and for the provision of various centres. During the year, 132 schools had been painted or cleaned inside or out. The system of carrying out repairs to buildings by workmen employed direct by the Board was being continued in nine of the 18 districts of the clerks of works for repairs, the total number of men so employed being 49. On the subject of rates of wages paid by contractors, the report clause was now inserted providing that where the London scale of wages applied the contractor should pay to the workmen not less than the rate of wages from time to time mutually agreed upon by the Central Association of Master Builders of London and the representatives of the men's unions, the agreed rate of wages at present recognised being set out in the schedule. In other districts where the London scale of wages did not apply the clause provided that the contractor should pay not less than the minimum standard of wages which might for the time be usual.

At Lady Day last the following amount of school accommodation was in course of provision:—Eighteen schools were being erected, providing accommodation for 19,013 children, and nine enlargements, giving accommodation for 3,521 children. Thirty-two additional sites for new schools had been or were to be purchased. The schools to be erected on 20 of these sites would provide accommodation for 17,920 children, and in the case of the other 12 the accommodation had not been determined. Ten new sites for schools had been scheduled, and the schools to be erected on five of them would give accommodation for 4,185. Twenty-four enlargements had been sanctioned for 8,075 children; and the Education Department had also sanctioned the provision of sites, which would be scheduled next session, in five districts.

THE PARTHENON.

RESTORERS have been at work on the Parthenon, much to the dismay, we should think, of all who denounce restoration as destruction or substitution. A correspondent in the *Times* describes the condition of this unique edifice, from which it appears that the structure has been obscured of late by a huge scaffolding at the western end, and that "certain rotten and broken architrave blocks have been removed and replaced with fresh blocks." "What vandalism!" we imagine some will exclaim—"a rebuilding piece by piece of the great temple reared by Ictinus and Phidias!" It does indeed seem a little ironical that we should have to substitute new for old stones with the object of preservation. But something must be done if we want to prevent the destruction of so priceless a treasure of great historical value to all time. Earthquakes have threatened the ruin, and it is necessary to shore up or repair the mischief already done. The work undertaken is to replace decayed blocks, and to secure the whole entablature against future seismic disturbances. We are told that the "interior stones of the entablature are rotten throughout," and these stones were broken by the late earthquakes, though they still hang together. Only the exterior stones of the epistyle are sound, and the inference is that the builders used the softer marble on the inside, as we should have done. The epistylum or architrave consists of three blocks of marble side by side, which stand on their edges and span the space of each intercolumn. The new inside Pentelican marble blocks are oiled and waxed to tone down their whiteness. To preserve the unsurpassed frieze and its world-renowned sculpture should be the main effort of all restoration; we mean, to preserve the work of Phidias, not a copy of it. We are informed the process of decay, due to age and other causes, has seriously impaired the beauty of the reliefs, and it certainly appears preferable that the entire frieze should be taken down and carefully preserved in a museum, than that it should

Fig. 165.

be allowed gradually to decay in position. The thought of severance and dissociation is certainly a cruel thing to contemplate; but the question is, Is it not better than the certain destruction that awaits it from natural decay and earthquakes? A modelled frieze or a copy of the original, it is suggested by the correspondent, could be substituted on the ruin. But we hope these reports are not so serious as they make out. Every lover of the Parthenon would be shocked to hear of any intention to remove so valuable a sculpture, which gives life and beauty to the whole structure, and makes it an historical record of priceless value. Other and more feasible plans are proposed, such as the roofing over of the ruin, which, however it may spoil the appearance, seems to be one of the most judicious modes of preserving the structure from the destructive agencies of moisture. In our issue of the 21st of May last, p. 729, we reported the lucid description given by Mr. F. C. Penrose, F.R.S., to the Royal Institute of British Architects of the measures which he, in conjunction with Professor Dürm, of Karlsruhe, and M. Lucien Magne, of Paris, had recommended the Greek Government to take for preserving the remains of the Parthenon. Associated with the members of the Athens Archaeological Society was Dr. Dörpfeld, a great authority on the subject. Mr. Penrose, in his paper to which we have referred, points to the instability of the angles of the pediments, owing to the great weight of the overhanging stones; but he said that no further injury had occurred to the western pediment, or to the posticum behind since his previous examination half a century ago. The most damaged portion was the hexastyle portico of this posticum, and at least five of the architrave stones, which are 13ft. 9in. long, would have to be replaced. Only four of the columns of this part are free; the other two are imbedded in the masonry of a Turkish minaret. Those who wish to see what was actually recommended will do well to read Mr. Penrose's paper. That gentleman describes minutely the position of the stones above the architrave which back and range in level with the Panathenaic frieze, which are cracked, and he attributes this damage chiefly to fire and to the earthquake of 1894.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXVII.

IN roof-work, lightness, both in weight and appearance, consistently with the strength demanded, has to be considered. When roofs are built of iron or steel girders, these are, generally, even though shallow, of the lattice type.

The roof of the Central Station, Liverpool, in

Fig. 164.

common with many others, has both principals, bracing-rafters, and purlins constructed thus. The main arched ribs or principals afford a good example of construction in wrought iron; they are so designed that they are capable of sustaining the

load of the roof without the use of ties. Ties are employed, however, for harmony of appearance and as a stand-by. Though the roof is made of wrought iron mainly, and was built about 23 years ago, the lattice work of the purlins and bracing-rafters gives the whole an appearance of much lightness.

A sectional view of the principals is given in

Fig. 165. Fig. 166 shows an elevation of the plated ends to the commencement of the channel-bracings, the end *a* being perpendicular; and Fig. 165 is a section through Fig. 166 in the plane *xx*. *A A*, Fig. 165, are the cast-iron distance-pieces bolted between the plates, seen also dotted in elevation in Fig. 166. The web-plates are jointed here also,

Fig. 166.

Fig. 164; they are formed of top and bottom plates and angles, and with bracings of channel iron singly triangulated. The flanges are made of plates 1ft. wide by $\frac{1}{2}$ in. thick; to each flange, two angle-irons, 4in. by 5in., of varying thicknesses, are riveted. The diagonal channel-irons *a a* are in pairs, placed back to back, but are kept 1in. apart, with a view to afford increased lateral stiffness, ferrule packings 1in. thick maintaining the distance correctly; they connect the flanges

and *b b*, *b b* are cover strips riveted over the joints. This is illustrative of a usual method of increasing the stability of long, light, curved roof principals at their abutments without adding much to the total weight.

A cheap method of building a light Warren girder is illustrated in Fig. 167. These girders were built in 80ft. spans for the Antofagasta Railway viaduct in Bolivia, over the River Loa; both top and bottom booms, which measure

Fig. 167.

Fig. 168.

Fig. 175.

by a system of single triangulation, and are riveted through connecting-plates, *b*, between, and packings, *c*, beyond the angles, the latter being of the same thickness as the angles. The principals are 3ft. 9in. deep, excepting near the ends, where the depth increases. In order to afford increased lateral stability at the springings, the ribs, 1ft. wide elsewhere, are enlarged to 2ft. wide at the bases, where they abut upon the supports, Fig. 165, and these portions are plated and connected with dis-

7ft. 11in. from centre to centre, are constructed of channel-irons, 10in. by 3in., placed back to back, at a distance of 1ft. 2in. between. The ties are flat bars, 7in. by $\frac{1}{2}$ in. at the ends, diminishing towards the centre, and the struts are each formed of a pair of tee-irons of various dimensions, connected with diagonal bracing, Fig. 168; this is a cheap form for moderate spans, saving a large amount of riveting. Gussets are not used, but the ties are riveted to the channels

Fig. 169.

Fig. 170.

Fig. 174.

Fig. 173.

Fig. 172.

through thickening-plates, which put the rivets passing through the channel-irons into double shear. The plan-view above, Fig. 167, shows how the channels are connected with cross and diagonal bracing; the end-posts are also formed of

two is that the struts have angles on opposite sides of the bar, and the ties have one angle only on one side. The double angles pass along each face of the gussets (compare with the sectional view, Fig. 170), and this puts the rivets into

Another method of building up a Warren girder is shown in Fig. 171. Here trough girders, built of plate and angle, are used for top and bottom booms; this is a girder of 126ft. 6in. span, used for the Salado Bridge, the depth being about 10ft. The bracings fit within the side webs of the trough girders, being riveted to gussets riveted to the web; each bracing member is formed of four angles, two on each side, connected by diagonal bracings of the same type as that in the girder elevation. The figure also shows the attachment of the cross girders, and of the rail girders above the cross girders. Details of the methods by which connections between main elements are made, will, however, be illustrated in a subsequent stage.

Figs. 172-174 show the building up of Warren girders to form the spans of a light iron railway bridge over the Nerbudda River, for the Indian State Railways. The booms are formed of angles, eight in each boom, maintained at the required intervals apart by means of packing-pieces and covering bars, thus employing little material, and leaving every part open to inspection. The triangular bracing is built of plate and angle near the ends and lattice-braced, Fig. 175, towards the centre of the spans. Short single gussets, 3in. thick, riveted between

Fig. 171.

channels, stiffened with plates *aa* at the backs, riveted and bolted through.

Figs. 169, 170 illustrate a portion of a Warren girder, in which struts and ties are each formed of bars and angle. The difference between the

double shear at those sections; the gussets pass between the angles, and the bracings lie directly upon the gussets. This involves the breaking-off of the vertical webs short of the gussets, and cover-plates make a joint between the two.

the vertical angles receive the riveting of the diagonals, lin. rivets being used. The main girders are connected by transverse girders at top and bottom; those at top being plated, those at the bottom being lattice-braced, Fig. 173. The roadway is carried by rail girders on the top—not shown—which are riveted with gusset-plates to the transverse plated girders. The method of building up the booms in these figures would not be followed in a long-span heavy bridge. The continuous plating of the top boom, illustrated in most of the previous examples, would be necessary for safety; or broad plating, alternating with lattice-bracing, would occupy an intermediate type. Only in this way could the severe compressive forces be resisted. J. H.

CLEANING IRON BRIDGES BY THE SAND-BLAST.

THE external condition of some of the public road-bridges over the Thames, within the jurisdiction of the Metropolitan authorities, is not a credit to the custodians of our own *Ponts et Chaussées*, nor does it favourably impress foreigners and visitors. Old Southwark and equally old—to within a few years—Vauxhall Bridge, together with that more modern monstrosity at Lambeth, cannot be said to be ornaments to the noble stream upon whose waters they cast their shadow. The second of the three on our list is doomed, and is now, in fact, existing only on sufferance until a temporary bridge is sufficiently far advanced to relieve it of all further duty for ever. The plans, designs, and necessary working drawings for new Vauxhall Bridge are making good progress; but if the erection of the new permanent structure is to proceed at the same time-rate as that of the temporary one, there is not a man at present alive who will ever cross over it. It is also pretty well understood that the demolition and rebuilding of Lambeth Bridge is to follow later on; but unless the approaches of both the principal and subsidiary roads and streets on the Middlesex shore be all cleared, widened, and otherwise improved at the same time, little or nothing will be gained by putting the project into execution. It is but fair to state that these remarks do not equally apply to other bridges lower down the river, which are periodically thoroughly well cleaned and painted and decorated in both an effective and handsome manner, as their position unquestionably demands.

It is when we pass from the road to the railway bridges that the uncleaned, unpainted, unkempt, and generally neglected appearance in which these structures are allowed to remain becomes unpleasantly conspicuous. One would be inclined to suppose that, apart from all æsthetic or other considerations, some attention would be given to the fact that the safety, durability, and what might be termed the life of a bridge, or of any other metallic erection, is very closely connected with the proper protection and preservation of its external surface. Now the painting process, even as usually conducted, is not *per se* a laborious or particularly troublesome one, although it must be admitted that it is frequently a terribly tedious operation. It is just possible that the introduction of the "spray-painter" will remove these defects and inconveniences; but we are not just at present concerned with this somewhat novel method of laying on pigment. Previously to painting any metallic surface it is absolutely necessary that it should be perfectly clean and entirely free from all old paint, rust, scale, and incipient corrosion of every kind. There are two especial reasons for these stringent precautions. One is, that if any rust or other source of corrosion be left underneath the new coats of paint, the latter will afford no protection whatever, and the corrosive action will continue in all its pristine vigour. The other reason is that very frequently, nearly always in fact, the new paint will not adhere to a dirty or foul metallic surface, although it may appear to do so when first laid on. After a very short time cracks and blisters make their appearance, the paint peels off, and the naked metal is exposed to all the destructive effects of climatic influences.

Recently it has been proposed to dispense with the services of the wire brush and the chisel, and to employ a jet or blast of sand projected with an adequate amount of force, by compressed air or other suitable means, upon the metallic surfaces to be cleaned. The installation required is simple, inexpensive, and easily managed, as will be at once apparent from the following brief

account of the cleaning of an iron bridge in America, of several spans, whose united length amounted to some 1,200ft. A reservoir for compressed air, a bellows, a sand-box, some flexible tubes connecting the reservoir with the hollow rod from which the sand-blast issued, completed the cleaning apparatus. The steam for driving the bellows can always be easily obtained, either from a small portable engine, or in large towns and cities from an ordinary steam-roller. It is evident that the diameter of the sand projector tube, that of the orifice or spout, and its length, are details which can be varied to suit the circumstances of each particular example. In the case alluded to, the projecting flexible tube was given a general diameter of 2½ in., diminished at the nozzle to ¾ in., and a maximum length of 30ft. A space of about 6in. separated the nozzle of the tube from the surface acted upon by the blast. So far as rapidity of execution is concerned, it must be recollected that a built-up iron or steel bridge—for example, one on the open-web or lattice principle—is not by any means a favourable specimen of construction to experiment upon. There are so many different members whose surfaces all lie in so many different planes, and abundance of holes and corners and rivets besides, that they prolong the work far beyond the time that would be needed to clean the same total amount of surface better disposed and arranged for receiving the action of the sand-blast.

In order to prove how the shape and contours of the structure governed the time in which the respective cleanings were conducted, the following figures may be quoted:—In the case of a bridge of the type we have selected, an area of about 2sq. ft. was effectually cleaned per minute. But when the bottom of an iron ship was submitted to the same process, the rate was exactly double—that is, 4sq. ft. to the minute. It is also claimed for the sand-blast that it does the work better, and more thoroughly, than the ordinary hand method; that it does not in any manner injure the material; and that it effects a considerable saving in the erection of temporary scaffolding and false work, which is probable enough. A word of caution may be put in here. Great care is required in applying the sand-blast to the cleaning of cast iron, and, indeed, it should not be so used by anyone not well skilled in the employment and manipulation of it. It may be scarcely necessary to mention that for the cleaning of stone or brickwork, and many other materials of construction, the sand process is utterly unsuited. T. C.

A NEW ROCK IN THE HIGHLANDS.

IN the 44th report of the Science and Art Department, just issued, an account is given in the Geological Survey Section of the composition of a remarkable rock belonging to a type hitherto unrecognised in Britain, which occurs at Kentellan quarry, about half a mile west of the Ballachulish granite. It is almost black, being known locally as "black granite," and shows lustre-mottling due to the presence of brown mica. The actual amount of mica is small, but uniform orientation may be seen to extend over surfaces measuring a ½ in. or even ¾ in. across. The rock is composed of olivine, augite, biotite, plagioclase, orthoclase, magnetite, and apatite. The olivine is fresh, colourless, and is traversed by the usual anastomosing veins of magnetite. It is also, as a rule, crowded with extremely minute and often rod-like inclusions, which give it a cloudy aspect when viewed with low powers. The sections of the individuals are never bounded by straight lines meeting in sharp angles, but traces of idiomorphism are not uncommon; in other words, the mineral occurs as grains or as crystals with more or less rounded angles. It is present as inclusions both in augite and biotite, and the feldspars are often moulded upon it. The augite occurs in grains, crystals, and patches, which vary in size—the largest often measuring several millimetres in diameter. The common crystalline forms may frequently be recognised, and the angles are often fairly sharp. The colour in thin slices is pale green, and sections which appear homogeneous in ordinary light often show a beautiful zonal structure under crossed nicols. Biotite occurs in small ragged patches, which, in spite of their apparent isolation, often show uniform orientation over large areas. The mineral is of a rich brown colour, approximately uniaxial and strongly pleochroic. It is not only moulded on the augite and olivine,

but also occasionally on the feldspars, and was therefore one of the last minerals to form. The feldspars, together with the small quantity of biotite, make up the interstitial matter in which the olivines and augites are embedded. Both plagioclase and orthoclase are present in approximately equal quantities, and the former is markedly idiomorphic with respect to the latter. The plagioclase sometimes shows a zonal structure, and probably ranges in composition from labradorite to oligoclase, the acid type predominating. It may be readily distinguished from the orthoclase by its higher refractive index and by albite twinning. The orthoclase occurs as interstitial matter (mesostasis). Individual patches sometimes show twinning on the Carlsbad plan. The accessory minerals are apatite and magnetite, the latter occurring almost exclusively in the veins which traverse the olivine. All the minerals are remarkably fresh. The occurrence of a large amount of olivine in a rock containing a considerable quantity of orthoclase is of so unusual a character that an analysis was made. The results of microscopical and chemical research show that the rock is in many respects a peculiar one. It possesses affinities with picrites and monzonites. In the low percentages of silica and alumina and high percentage of magnesia it resembles the former; whereas in the total amount and relative proportions of the alkalis it resembles the latter. The mineralogical composition of the rock also illustrates these affinities. In the extraordinary abundance of olivine and augite the rock resembles the picrites, but in the character of the augite and in the presence of both orthoclase and plagioclase in approximately equal proportions, it resembles the monzonites. It seems more desirable to emphasise the relation of the rock to the monzonites than to the picrites, and it may, therefore, be termed an olivine-monzonite. The typical monzonites contain, however, only a small quantity of magnesia (2 to 4 per cent.), and that the rock from Smålingen, Norway, which contains olivine, and which Prof. Brögger classes as an olivine-monzonite, possesses only 7.45 per cent. The rock from Kentellan quarry, with 15.26 per cent. of magnesia, is far richer in olivine than any rock hitherto recognised as belonging to the monzonite group.

THE STAINED-GLASS AT THE VERDIN TECHNICAL SCHOOLS, NORTHWICH.

SOME very good stained-glass has been erected in the Verdin Technical Schools, Northwich, which building we illustrated on p. 177. The window at the main entrance, which we illustrate herewith, is described as "The Empire Window," the idea being to indicate the vast extent of the dominion over which her Majesty holds sway. The centre panel is appropriately occupied by a portrait of her Majesty Queen Victoria, encircled with a wreath, on which is inscribed in quaint characters the date of her Coronation and Jubilee. The outer space or field is filled in the upper portion with two figures of "Fame" and "Peace." Fame holds a torch, and Peace carries a palm in her hand, and each supports the Crown of Empire which is held above her Majesty. Below are two "amorini" sustaining a small shield, on which are inscribed Tennyson's well-known lines—

She wrought her people lasting good,
Her Court was pure, her life serene;
God gave her peace, her land reposed;
A thousand claims to reverence closed
In her as mother, wife, and Queen.

Flanking this at each side are, to the right, shields of New Zealand and Tasmania, and, to the left, of Ceylon and Jamaica, with the usual mantlings. In the square above her Majesty are emblazoned the Royal arms, and below the arms of India. The two corner windows at the top are filled in with the arms of the West Indies and the Cape of Good Hope, whilst the bottom corners are charged with the arms of Australia and Canada.

The territories under British sway are so numerous that it would have been impossible to have included representations of them all, but the above representative possessions have been carefully selected, and tell their own tale.

Near to this window is the small window described as the "Prince's" window, containing the portraits and arms of their Royal Highnesses the Prince and Princess of Wales. His Royal Highness as Earl of Chester has a distinctive

WEST INDIES.

claim for recognition in this conjunction. The motto underneath is that borne by Richard I., popularly known as Richard the Lion-hearted. The arms below the Princess are the quarterings of the Danish Royal family encircled with the insignia of the Order of the Golden Elephant, the motto on the label being that of the Royal House of Denmark. Flanking the shields the field of the window has been enriched with the Prince of Wales' feathers, which the Princess is entitled to emblazon.

The window to the art entrance has been

described as the "Victorian" window, and is suggestive of men of mark in her Majesty's reign. In the centre large square the arms of the donor, Sir Joseph Verdin, Bart., encircled in a wreath of fruit and foliage, resting on a large cartouche. Above this comes the portrait and arms of H.R.H. the late Prince Consort. The arms to the left are those of H.R.H. the Duke of Saxe-Coburg, and the arms to the right are the Royal arms with the label, the whole inclosed in a bold cartouche, with pendent foliage and fruit. Above this is the portrait of his Grace the Duke of Westminster,

K.G., inclosed with wreath, and set on a cartouche of similar design to the one below in the "Prince Consort" window. At each side of the portrait are the arms of the Duke and Duchess respectively. The right and left top corner lights in this window are filled in by portraits of the Most Noble the Marquis of Salisbury and the Right Hon. W. E. Gladstone, representing statesmanship. Below these come two men eminent in the field of art and literature, Lord Leighton and Lord Tennyson. And below these again are portraits of Michael Faraday and George

Stephenson, representing chemistry and engineering skill. The two lower panes are filled in with the portraits of the late Mr. Robert Verdin, M.P. for the Northwich Division, and Sir Joseph Verdin, Bart., the donor of the institute. This latter portrait has been expressly included at the desire and cost of the Northwich Urban District Council.

The two central lights in the committee-room are enriched with the arms of Chester and Northwich respectively. The arms of each are similar, being the sheaf or garb, but different in their supporters. The supporters of the arms of Chester carry a feather in recognition of the office which the Prince of Wales holds as Earl of Chester.

The large window in the gymnasium is devoted to illustrating in flat and silhouette the various games which will be practised and encouraged within the building.

The whole of the stained glass has been designed and executed in the studios of Messrs. W. G. Sutherland, Limited, of Mosley-street, Manchester.

ART EXHIBITIONS AND SCHOLARSHIPS.

THE following is the list of candidates to whom Royal Exhibitions (Art) and Local Scholarships (Art) have been awarded, 1897, by the Department of Science and Art:—

ROYAL EXHIBITION.

Charles Arthur Palmer, aged 22, Art Student, Croydon.
Rex Osborne, 20, Art Student, R.C.A., South Kensington.
Thomas Currie Bell, 24, Art Student, Edinburgh.
Charles James Pibworth, 19, Art Student, Queen's-road, Bristol.
Joseph Tom Friedenson, 19, Art Student, Leeds.
Mary Caldwell, 23, Art Student, Canterbury.
Nathaniel Heard, 24, Art Student, Hull.
Alfred Samuel Ryland, 19, Art Student, Cheltenham.
Thomas Siminon, 22, Art Student, Queen's-road, Bristol.
Luke Thomson Taylor, 20, Art Student, St. Leonard's, York.

LOCAL SCHOLARSHIPS.

Marion E. Broadhead, aged 20, Art Student, Macclesfield.
Benjamin Clemens, 21, Art Student, Camden, Holloway.
Herbert Slinger, 21, Art Pupil Teacher, Technical College, Bradford.
Charles Grange Lowther, 17, Sign Writer and Decorator, Hull.
Gertrude Lydia Mary Syme, 21, Art Pupil Teacher, Watford.
William George Simmonds, 21, Art Student, R.C.A., South Kensington.
Henry John Lintott, 20, Art Student, Brighton.
Reginald Fairfax Wells, 19, Art Student, R.C.A., South Kensington.
John Frederick Pettinger, 19, Art Student, St. Leonard's, York.
Robert Herdman Smith, 17, Art Student, Leeds.
Hilda May Giraud, 19, Art Student, Brighton.
Sydney March, 21, Carver, Hull.
John Macdonald Aiken, 17, Monumental Draughtsman, Gray, Aberdeen.
Walter Taylor, 21, Tapestry Weaver, Putney.
John Earnshaw Sutcliffe, 21, Lithographic Artist, R.C.A., South Kensington.
Leta Rosina Roff, 18, Art Student, North London.
James Albert Hancock, 21, Art Student, Leeds.
Ernest William Cotton, 19, Art Student, Municipal, Birmingham.
Thomas Cantrell Dugdale, 16, Art Student, Cavendish-street, Manchester.
Ethel Beatrice May, 19, Art Student, Municipal, Birmingham.

A Royal Exhibition is tenable for three years, and entitles the holder to free admission to the Royal College of Art at South Kensington or the Metropolitan School of Art, Dublin, for the session of about 42 weeks each year, and during that time to a maintenance allowance of 25s. a week and third-class railway fare for one journey to and fro each session between the home of the scholar and London or Dublin. The Royal Exhibitions are held on the condition that the Exhibitor regularly attends the course of instruction laid down for him, complies with the rules laid down for his guidance, and makes satisfactory progress. The allowance may be withheld or reduced in the case of a student who fails to attend the Royal College of Art or the Metropolitan School of Art at the prescribed time. A Local Scholarship is tenable for three years, with a maintenance allowance of £20 a year, at any School of Art under the Department which is open at least three days and five nights a week, and which will remit the fees for instruction of the holder. The scholar must attend a School of Art during at least 40 weeks in the year for 30 hours each week, of which 18 hours at least must be in the day. The scholarship commences on the date at which the school, where the Scholarship is tenable, reopens after the summer vacation in each year. The maintenance allowance is paid quarterly, on the receipt of a certificate from the master and secretary of the School of Art that the scholar has attended regularly and pursued his studies satisfactorily. No candidate can obtain

both a Royal Exhibition and a National Scholarship; nor can he hold a Local Scholarship with either. But the past or present holder of a Local Scholarship may compete for a Royal Exhibition or a National Scholarship, and the Local Scholarship will determine as soon as the holder enters on the Royal Exhibition or National Scholarship.

RESERVOIR FAILURES IN AMERICA.

IN a recent number of the *Engineering News* a description is given of the failure last July of two earthen dams having masonry heart walls erected at Melzingak by the Fishkill and Matteawan Water Company. The dams are stated to have been well designed and built, whilst the area of discharge over the by-washes was in accord with rules proposed by an eminent American engineer. The two dams were comparatively small, and were located one above the other on a mountain stream. The upper had a capacity of 8,000,000 imperial gallons, whilst the lower could impound 64,000,000 gallons. The upper dam was 340ft. long and 38ft. high, whilst the lower was 400ft. long and 34ft. high. In each case there was a masonry heart wall 3ft. thick at the bottom, tapering to 1ft. or 1ft. 6in. at the top, and carried up to within 1ft. at the top of the bank. This wall was backed with earth on each side, the upper slope being covered with stone pitching. The earthwork in the case of the lower dam had been somewhat carelessly put in place, but with the upper one greater attention had been paid to securing good work. The by-wash in the case of the upper dam was 4ft. long, its crest lay 1½ft. below the top of the bank, whilst in the case of the lower dam the by-wash was 75ft. long and 18in. deep. This small difference between the levels of the top of the banks and the crests of the overflow weirs is the point most to be criticised, especially as a certain settlement of the main bank had occurred in each case, further reducing the margin of safety. Another objectionable feature was to be found in the laying of a pipe through the bottom of the banks, but this had, as it happened, no bearing on the failure. This arose by the upper bank being topped by a flood, although on the day of the accident the water-level in the reservoir had been 7½ft. below the crest of the upper overflow weir, and the rainfall recorded in the neighbouring meteorological stations was nothing extraordinary. Apparently, however, there must have been a local fall of very great intensity, which rapidly filled the reservoir, and which the by-wash proved inadequate to carry off. Once the bank was topped, the dam soon gave way, and the flood, passing down, of course, carried away the lower bank, which nothing could then have saved.

CHIPS.

Through the exertions of the vicar, and the munificence of Lord Llangattock, Mr. Walter Savage Landor, and others, the ancient Abbey Church of Llanthony, Monmouthshire, has been restored and reopened.

The vestry of Paddington have borrowed £13,000 from the London County Council for the purpose of extending wood pavements in the parish. Already about eight miles of the streets of Paddington are paved with wood, but mostly soft wood. For reasons of durability, cleanliness, and sanitation, the vestry have now abandoned the use of soft deal in favour of hardwood, and have accepted a tender for the supply of 850,000 West Australian hardwood blocks at £10 17s. 6d. per 1,000 blocks.

At Stockport on Tuesday some workmen were engaged demolishing old gas works, which are to be replaced by an electric lighting station, when the scaffolding suddenly collapsed, and three men named William Maull, Peter Higgins, and Joseph Woodall were precipitated into some disused tanks below, a distance of 40ft. The men lie in the infirmary in a critical condition.

The English Arboricultural Society assembled in Lynn on Tuesday for the 16th annual general meeting and 12th annual excursion. Mr. F. W. Beadon, president for the year, occupied the chair. The business included the election of new members, of whom there were about 30, the adoption of the statement of accounts, and the election of representatives on the council and other officials. On Wednesday the members visited Sandringham.

Mr. Onslow Ford, R.A., has now completed the memorial statue of Dr. R. W. Dale—a seated figure—and it will soon be sent to Birmingham, to be placed in the Art Gallery. It is probable that it will be ready for inauguration about the middle of October.

OBITUARY.

Lieut.-Gen. Sir WILLIAM FRANCIS DRUMMOND JERVOIS, G.C.M.G., C.B., R.E., who died on Tuesday from a carriage accident at Bittern Court, aged 70 years, had done good service to the nation in his earlier years of professional life in designing fortifications and other engineering works. From 1842 to 1845 he was professionally engaged at various frontier stations, making roads, building bridges, and establishing military posts. In 1845, having been appointed acting adjutant to the Royal Engineers, he accompanied the chief engineer over the whole frontier of the Cape Colony and the settlement of Natal. During the Kaffir war he made a military survey and map of Kaffraria—a work of great difficulty in the midst of the military operations. In 1852 he was ordered to the Island of Alderney for the purpose of designing plans for the fortifications, and the superintendence of their execution—a work strongly advocated by the great Duke of Wellington. In 1855, Major Jervois was nominated by Lord Panmure a member of a committee on barrack accommodation, whose labours contributed much to the improvements which have of late years been effected in the construction of barracks as well as in the sanitary condition of our troops. In 1856 he was appointed Assistant Inspector-General of Fortifications under Sir John Burgoyne, and on the appointment in 1859 of a Royal Commission to report upon the defences of the country, he was selected by the Government to be secretary. He was at the same time secretary to the Permanent Defence Committee, under the presidency of the Duke of Cambridge. He became the confidential adviser of Lord Palmerston and of several Secretaries of State on matters relating to defence, and designed the fortifications of Portsmouth, Plymouth, Pembroke, Portland, Cork, the Thames, the Medway, and other places. During his long service, nearly 20 years, in the War Office, he was also a member of the Special Committee on the application of iron to ships and fortifications. In 1862 he was appointed Deputy-Director of Fortifications, and in 1863 was sent on a special mission to report on the defences of Canada, Nova Scotia, and New Brunswick, on which occasions he visited the fortifications at the principal ports on the seaboard of the United States. In 1864 he was sent again on a special mission to Canada to confer with the Canadian Government on the question of the defence of the Dominion. On his return to England his report was laid before Parliament, and the Imperial Government undertook to carry out the defences of Quebec on the plan recommended by him. He was also sent on special missions to Bermuda, Halifax (N.S.), Malta, and Gibraltar, and planned improvements and additions to the fortifications of those places. In 1871-72 he was ordered to India to advise the Government of India respecting the defences of Bombay, Aden, the Hooghley, and other places. He was Governor of the Straits Settlements from 1875 till April, 1877, when he was appointed to advise the Governments of the Australian colonies on the defence of their chief ports. While in Australia he was selected to be Governor of South Australia. In December, 1882, he was appointed Governor of New Zealand, where, on his advice, the fortification of the principal ports was undertaken by the Colonial Government. Throughout his stay in Australasia till 1889 he continued to be chief adviser of the Governments there on matters relating to defence.

Mr. FRANCIS GOULD MORONY STONEY, M.I.C.E., Managing Director of the firm of Ransomes and Rapier, Limited, Waterside Works, Ipswich, has died suddenly at the age of 60, at Neuenahr, Germany. Mr. Stoney was born in County Tipperary, and was the son of Mr. Thomas Stoney, of Arran Hill and Kyle Park, in that county. He received his engineering education at Queen's College, Belfast, and afterwards served his apprenticeship with Sir John MacNeill, then engaged on important work in connection with Irish railways. He subsequently acted as manager of Dundalk Foundry, from which position he passed to the service of the Clyde shipbuilding firm of Mr. John Elder, of Glasgow. During 1855 and 1856 he represented it in South America. Shortly after he returned home he again left England, in April, 1868, for India, and there continued two years. It was during this period that his attention was first turned to the problem of the control of large rivers, both in regard to their liability to floods and to their use for irrigation in hot countries. Ever since then

the best of his engineering powers have been devoted to the invention and maturing of various sluice mechanisms. Ten years ago Mr. Stoney became manager of the Waterside Works at Ipswich, and during his connection with that firm they have provided sluices for the Manchester Ship Canal and for the river Weaver; a movable weir on the Clyde at Glasgow, with sluices after Mr. Stoney's own designs; and similar work on the Thames at Richmond; while his designs for storing and controlling the Nile water at Philæ have been under the consideration of the Egyptian Government. During his residence in Ipswich the machinery laid down at the Waterside Works had more than trebled. He sat for a year on the town council of Ipswich.

CHIPS.

The Hospitals Committee of Glasgow Corporation have resolved to build a new Hospital Reception House at a cost of £6,500.

The City of Leeds has purchased for its permanent collection a large seascape entitled "A Wave," by Mr. R. E. Robertson—a picture exhibited in the Liverpool Autumn Exhibition of last year.

The Linslade Rural District Hospital, Leighton Buzzard, is being warmed and ventilated by means of Shorland's patent Manchester grates, patent exhaust roof ventilators, and special inlet panels, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

An application is about to be made to the Consistory Court of Ripon to grant a faculty authorising the removal of the north and south galleries, the erection of new clergy and choir vestries and north and south transepts, and other alterations required in the Bradford Parish Church, as a permanent memorial of the labours of the late Archbishop Bardsley, for sixteen years vicar of the parish. The estimated cost is £4,000, and the works are to be completed within twelve months from the time of the faculty being obtained.

Rothsay Town Council, over which the Marquis of Bute presided, resolved last week to invite the Sanitary Association of Scotland to hold its annual congress at Rothsay next year.

The new Headland Hotel, to be forthwith erected at Newquay on about six acres of land overlooking the Headland and Fistral Bay, will have a frontage of over 300ft., with five floors. Mr. Silvanus Trevail, of Truro, is the architect.

The Bishop of London (Dr. Creighton) will visit Leicester on Tuesday, Oct. 5, in order to open the new Technical and Art School, which is now being completed in the Newarkes at a cost of about £40,000.

The Tamworth Rural District Council considered, on Saturday, the appointment of a highway surveyor, at a salary of £150 per annum. A member moved the appointment of Mr. H. J. Clarkson, the present surveyor to the council, &c., which was duly seconded. An amendment was proposed in favour of deferring the appointment for a month, and advertising the position. A discussion ensued, in which a Mr. Clark, in supporting the amendment, declared that the making of the appointment was planned, and was the biggest piece of rotten jobbery he had ever heard of. The chairman denied it, and said it was an insult to the council. On a division the voting was equal, being eleven on either side, and the chairman, who had not previously voted, gave his vote in favour of the proposition. Mr. Clarkson was accordingly appointed.

The fifty-fourth annual congress of the British Archaeological Association opened at Conway yesterday (Thursday), and will last until Thursday in next week.

The committee of the Congregational Union has arranged for a whole session to be devoted to the important question of church extension at the forthcoming meetings to be held in Birmingham. It is proposed to formulate a scheme to raise a national fund of £100,000 for the purchase of sites and the erection of church buildings in centres of large populations.

The foundation-stones of new schools erected in connection with the Wakefield-road Baptist Church, Stalybridge, were laid on Saturday. The estimated cost of the schools is £2,500.

At a special meeting of the South Bank and Normanby Urban District Council, held on Monday, Mr. A. Smithies, of Leeds, was, out of 16 applicants, appointed surveyor. The salary is £120 per annum.

Professor W. H. Corfield has been elected an honorary member of the Royal Society of Public Health of Belgium, of which he has been a corresponding member for some years. The honorary members consist of Ministers, ambassadors, and other high State officials, and a few foreign hygienists. Professor Corfield is the only Englishman who has received this honour.

COMPETITIONS.

BLACKPOOL.—At a meeting of the directors of the Blackpool Jetty Company held last week the design submitted by Mr. R. Knill Freeman, F.R.I.B.A., in limited competition for the extension of the central pier and the erection upon it of a pavilion and other buildings, was adopted. The engineering works in connection with the substructure will be carried out from the designs of Mr. Thos. Dryden, engineer, Preston, who has just completed extensive works of a similar character on the North Pier. The leading feature of the design submitted by Mr. Freeman is an absence of square ends and elevations which would offer great resistance to the winter gales. Four toll-houses are proposed, with turnstiles at each face, and sliding gates allow of the pier being quickly cleared. The other buildings are for a board-room, secretary's office, retiring-rooms, ladies' lounge, reading-room, and shops. The widening of the structure is proposed, with a new dancing pavilion or concert hall. The pavilion is Indian in style. There will be accommodation on the ground floor for 2,000, and for 500 in the gallery. There is provision for two corner shops at the westerly end, two refreshment buffets at the easterly corners (approached from without and within), and a dozen other shops, each 10ft. deep, at stated positions round the pavilion. The intervening spaces will be taken up by lavatories, side exits, toll offices, shelters, &c. The angles of the building are treated as turrets, and inside are foyers at each corner; two domes rise from the centre of the roof, four lounges are built in the sides to back the shelters outside, and the ceiling is flat and specially designed for decorative effect. Behind the orchestra is a balcony for open-air concerts and dancing, so devised that it could be added to the stage. Mr. Freeman estimates the cost of the pavilion at £6,350. So far as the treatment of the present pier-head is concerned, the architect proposes a revolution of the existing accommodation. An open-air dancing-platform would be left; but on each side a width would be covered in like a verandah, where the festivities could be carried on during inclement weather. Provision is also made for a large circular bar facing the sea, with private, smoking, and cloak rooms, and five shops, with kiosks at each corner of the deck overlooking the jetty. The work will probably be commenced at the close of the present season, and be proceeded with as expeditiously as possible. Mr. Freeman's design was also accepted for the extensive improvements being carried out on the North Pier, these including the widening of the structure (which has already been completed) and the erection of a pavilion and other structures at the promenade end of the pier.

PLAYING-CARD DESIGNS.—The Playing-Card Makers' Company offers the "H. D. Phillips prize" of £5 5s. for the best special design for the backs of playing-cards, intended for presentation by the company to its guests at the banquet of the masters and wardens in November next. Two other prizes—of £3 3s. and £2 2s. respectively—are offered by the company for the two next best of such designs. The designs must be in colour, and be such as can be reproduced effectively in not more than six printings. The arms of the company and of the City of London are to form a portion of the design. Designs must be sent not later than September 27 next to Mr. W. Hayes, the clerk of the company, Guildhall, London, E.C., of whom full particulars as to the competition may be had.

SAN FRANCISCO UNIVERSITY.—According to the *San Francisco Examiner*, Messrs. J. B. Reinstein (Regent of the University of California) and H. E. Maylock (of the Architectural Corps at the University) have just returned from prolonged trips in the Eastern States and in Europe, where they have consulted architects, artists, and landscape engineers upon the development of the university construction. Professor Guadet, of Paris, will probably arrange a programme by which eminent architects of all nations will be requested to send in sketches of their plans at a given date, and these will be assessed by a jury consisting of one recognised authority each from England, France, Germany, and the United States, and a representative of the University, the understanding being that each architect submitting plans will receive some recompense. At least ten of the best sketches will be selected by the jury, and the authors will be requested to elaborate their plans. The architects so selected will be permitted to name four additional members

of the jury, and these nine jurors will select the ultimate plan. It is probable that there will be about thirty buildings in all, each of which will be built of marble or other stone. The considerable expense attending this preparation is unrestricted, and has been borne by Mrs. Phebe A. Hearst.

The town council of Newport, Mon., have resolved to apply for sanction to borrow £21,000 for the proposed town hall extension, and £5,000 for the supply of electric machinery (supplementary estimate).

Mr. William Tomkinson, a leading Liverpool builder, who carried out many large contracts in the city, died on Saturday, aged 62 years. He devoted his leisure to photography, taking an active part in organising exhibitions at the Walker Art Gallery.

Mr. Albert J. Hepper held a Local Government Board inquiry at West Bromwich on Tuesday respecting the application of the town council for sanction to borrow £2,100 for alterations and additions to the public baths, £300 for the erection of an engineer's residence, and £1,149 for the provision of a technical school. The borough surveyor (Mr. A. D. Greateorex) presented plans of the scheme, and said it was proposed to extend the first-class swimming-bath, and also to improve it by putting a gallery round.

The East Sussex County Council have given notice of their intention to withdraw in 1902 from their connection with the town council of Brighton in the matter of asylum accommodation. The Hayward's Heath Asylum is to be left to Brighton, and a new building will be erected for East Sussex.

A special committee of the Manchester Corporation have decided by a large majority to recommend the city council to municipalise the Manchester tramways.

Mr. Brock, R.A., and Mr. T. Graham Jackson, R.A., are making progress with the Benson memorial for Canterbury Cathedral. The memorial takes the shape of an altar-tomb, with a recumbent effigy of the deceased Primate, and a canopy. This will absorb about £2,000, and the balance of the fund, amounting to another £2,000, is to be handed over to the Truro Cathedral Building Committee for the completion of some portion of that edifice.

By invitation of Mr. James Mansergh, V.P.I.C.E., the engineer of the works, a visit to the Elan Valley waterworks (Mid-Wales) for the supply of the city of Birmingham, will take place on Saturday in next week, Aug. 28. This visit is intended for members of the association only, and no visitors will be allowed to attend. Members are to reach Shrewsbury on Friday evening, Aug. 27, and assemble at Shrewsbury Station the following morning at 7.40, in time to leave by the 7.55 train for Rhayader.

At Bromley, near Pensnett, the first sod was cut on Monday on the site of colliery shafts which are to be sunk forthwith. The enterprise is expected to result in the development of the whole of the ungoten solid thick coal now remaining to be obtained between Bromley "fault" and the great western boundary "fault," which up to the present has remained unsurmountable. In addition to practically demonstrating the existence of extensive coal measures of great value, it will prove the existence of a large area of the Permian measures, part of which is believed to contain a good quality of terracotta strata, similar, and supposed to be equal, to that in the Ruabon district. Mr. U. Cox is the engineer, and Mr. John Williams the contractor.

The erection at Edinburgh Castle of the new military hospital, for which a grant of £18,000 was recently voted by Parliament, is now being rapidly proceeded with. The site of the new hospital is at the north-west corner of the castle rock, overlooking Princes-street and Castle-terrace. It will occupy the place where the stores and magazine formerly stood. The buildings are to be treated in the Scottish Baronial style, and will, it is promised, harmonise with the older portions of the castle—more than can be said of some of the hideous modern erections that disfigure the ancient stronghold.

New coal-factor's offices, with coalyard and stables behind, have just been built in Friars-street, Reading, from designs by Mr. G. W. Webb, of that town. The street façade is of red Mansfield stone, Bath stone, and granite. Messrs. Lewis Brothers, also of Reading, were the builders.

The Chester County Police arrested on Sunday at Earlstown, under a warrant, Elisha Lees, of Sandbach, who is charged with misappropriating £750 trust money. Lees has held many responsible positions at Sandbach, having been surveyor to the old local board, collector of Queen's taxes, secretary to the gas company, and a member of the local board. He was brought before the Sandbach magistrates on Monday and Wednesday, when he was committed for trial at the assizes.

Building Intelligence.

BILSTON.—The opening took place on Friday of the new waterworks and the technical schools. Bilston has hitherto been supplied with water by the Wolverhampton Town Council. Steps were taken to secure an independent supply, land was secured at The Bratch, at Wombourne, and, water of a pure quality having been found, the necessary plant was laid down. The works opened on Friday include engine-house, well-house, boiler-house, machine-fitting and repairing shop and stores; while the plant consists of two boilers, two engines, and two sets of pumps, with the usual accessories. All the machinery is in duplicate, in case of a breakdown. The total cost of the scheme is £45,000, and the work has been designed and carried out by Mr. Baldwin Latham, M.I.C.E., of Westminster, while Mr. C. L. N. Wilson (the town surveyor) has acted as resident engineer. The technical schools, also opened on the same day, are situated on the Willenhall-road, within a short distance of the Town Hall, and have been erected on 1,433 square yards of land. The architect was Mr. C. L. N. Wilson, the surveyor to the urban district council, and Mr. Thos. Tildesley, of Willenhall, was the builder. The style is Italian, and the first elevation has been carried out in red brick and terracotta. The total estimated cost is £6,000. The building comprises large lecture and examination room, and fourteen small rooms, which will be used as workshops and laboratories.

BIRMINGHAM.—The extensive block of premises forming the lower part of Cannon-street and Needles-alley, is about to be demolished, together with the three shops between the two thoroughfares in New-street. The property is, says the local *Post*, one of the most ancient pieces of old Birmingham existing in the centre of the city. The low-roofed old-fashioned buildings, with the shop fronts brought up to the street line, are in strange contrast with the modern commercial houses on either side, and their replacement by handsome shops, erected on the most modern principles, will be a conspicuous improvement to New-street. In the early days of the 18th century two houses stood upon the site. They were built by one William Weeley and in 1729 were in the occupation of William Weeley and Thomas Abell. Attached to them was a close, known as Hipkins's, and there were also four little gardens in front. Some time in the "thirties," the houses were turned into three shops by the addition of business frontages which occupied the site of the gardens, and brought the shops up to the line of the street. As time went on, the shops were enlarged by extensions at the rear, offices were built, and other houses attached. Now these have become old, and in their turn will give place to better property. A portion of the property having a frontage to Cannon-street of 144ft., to New-street of 66ft., and to Needles-alley of 164ft., has been let on a lease for 99 years to the Clarence Property Company, Ltd., a syndicate which owns a number of central properties in the city. The company propose to demolish the block, and to erect several shops, together with offices, &c., at a total cost of at least £20,000. It is expected that the new pile of buildings will be completed by the autumn of 1898. The new buildings will be erected in accordance with the plans of Messrs. Essex, Nicol, and Goodman, architects, Newhall-street. Provision is made for four shops fronting New-street, to occupy the space of the three original buildings. They will extend to about half the depth of the site—namely, 80ft. The shops are to include the ground floor, a mezzanine floor, interposed in consequence of the considerable rise of the land up Cannon-street, and first, second, and third stories, the central portion over the two middle shops being continued as an extra storey to form an ornamental gable. In Cannon-street there will also be room for four shops about 70ft. in length, and running through to Needles-alley. Over the shops will be built three floors, which, together with the upper stories in New-street, will be let for professional and other offices, and approached from a staircase entrance in Cannon-street. The general style of the design is a Free Renaissance.

EDGWARE-ROAD, W.—Mr. John Aird, M.P., laid the foundation-stone of the new Metropolitan Theatre of Varieties, Edgware-road, on Tuesday. The new building will stand on the site of the old house. A part of the original structure has been preserved; but the auditorium will be com-

pletely reconstructed. It will contain a large balcony and gallery, built on the cantilever principle, which abolishes intervening pillars. Private boxes of white marble will be erected on the ground floor on either side of the stalls, and the seating capacity of the house will be increased to 3,000. The stage will be enlarged, and new dressing-rooms provided, while attention is being paid to exits and precautions against fire. The decoration of the auditorium will be Flemish in style, and the walls of the entrance will be of white marble, surmounted by Indian ornamentation in rich colours. An entirely new frontage is to be erected, additional premises having been purchased on the right of the former house. The work of reconstruction was undertaken three months ago, and it is hoped that the theatre will be completed and ready for opening by the end of November. Mr. Frank Matcham is the architect.

FULHAM.—The new Grand Theatre, in the High-street, which has been built from the designs of Mr. W. G. R. Sprague, will be opened on Monday next. The theatre is built of white Portland stone, is Classic in treatment, and is surmounted by a allegorical group, above which is placed a 5,000-c.p. arc-lamp. The theatre is entirely isolated, a wide roadway surrounding the building. The front has a semicircular portico, over which is a loggia to be used as a smoking lounge. From the ground-level a flight of broad steps leads to the entrance vestibule, semicircular in shape, constructed to complete the circle of which the portico forms one-half. The inner vestibule has a domed ceiling supported by marble columns with bronze caps; leading from which is the grand crush-room, the ceiling of which is panelled out in a large oval centre. The dress-circle is reached by two corridors from a marble staircase leading from the centre of this room, while entrances to the stalls are on either side. The auditorium is capable of seating 2,239 persons, and is divided into six classes of seats—viz., eight private boxes, stalls, dress-circle, balcony, pit, and gallery. The Louis XIV. style of decoration is adopted throughout the house. The centre panel of the ceiling is dome-shaped, with four medallions in mitres, filled in with painted subjects. The proscenium is finished with open scrollwork and figures. The whole of the decoration is treated in shades of cream and light terracotta, and all the ornamentation is richly gilded. The electric light forms a feature in the scheme of decoration. The act-drop has been painted by Mr. W. T. Hemsley. In the auditorium there are no columns; it being constructed on the cantilever principle. The fireproof curtain separating the auditorium from the stage can be lowered in four seconds. Iron doors are also provided in all the corridors.

CHIPS.

The chancel of the parish church of Drax, near Selby, was reopened on Saturday by the Archbishop of York, after complete restoration at a cost of close upon £1,000.

The Dean and Chapter of St. Asaph have decided to reconstruct the cathedral organ, built in 1830, at a cost of £1,200. The new instrument is expected to be ready by Christmas.

The Duke of Connaught opened on Friday afternoon the Aldershot Hospital, of which the foundation stone was laid by the duchess a year ago. The hospital, which has been built at a cost of £3,000, is in style based on English work of the 17th century, and was designed by Mr. Thomas Davison, A.R.I.B.A. Mr. G. Kemp was the builder. The furniture is chiefly of oak.

The Giant's Causeway Defence Committee have decided to proceed with an appeal from the Vice-Chancellor's decision, which was in favour of the syndicate excluding the public from the causeway, except on payment of a fee.

The new Liberal Club in Adelaide-street, Crawshawbooth, near Heywood, is now nearing completion, and will be ready for opening towards the end of October. The building will contain a news-room, committee-room, smoke and card rooms, and a billiard-room to hold two tables. The architect is Mr. Alfred Coates; the contractor for masons' and joiners' work, Mr. Ormerod Ashworth; painting, decorating, and plastering, Messrs. Whitehead and Binns; plumbing and gasfitting, Mr. Miles Lonsdale; and slating, Mr. Tomlinson, Rawten-stall.

The slate quarries at Okehampton, Devon, have been taken on a lease for 21 years from September 1, and consequently will be reopened after being closed for a number of years.

Engineering Notes.

BREMERHAVEN.—The new Emperor's Dock at Bremerhaven, which is now almost ready to be opened, will provide Germany with a war port and dockyard second only in magnitude to those in England. The new dock, which is entered from the River Weser, comprises an outer basin of 646ft. in length and 78ft. in width, a lock-chamber of 711ft. by 90ft., an inner basin with 5,654ft. run of quay accommodation, a dry dock which is claimed to be the largest of its kind in the world, and another open basin for ships which do not require dry-docking, but wish to complete all kinds of repairs afloat. The old Emperor's Dock, which was constructed between the years 1872 and 1876, at a cost of 7,500,000 marks, has an area of water of 15 to 17 acres. The harbour extension, however, has a water area of no less than 29 acres, and has already cost £918,500 sterling. The lock-chamber is large enough to hold the *Kaiser Wilhelm der Grosse*, which is claimed to be the biggest steamer afloat. It is 226ft. longer and 10ft. wider than the lock-chambers of the North-East Sea Canal.

THE NEW LINE TO LONDON.—Rapid progress is being made with the Metropolitan and Southern divisions of the Grand Central Railway. Upon the southern division, forty-one miles in length, extending from just north of Rugby to the junction of the Metropolitan Railway at Quanton-road, the earthworks are rapidly approaching completion. Only one viaduct, that at Catesby, remains to be finished, and this is well forward. The important bridge crossing the Birmingham and Oxford canal near Rugby is progressing satisfactorily. The brickwork of the Catesby Tunnel, which is 3,000yds. in length, and at one time presented considerable difficulty, is now entirely completed, and material trains will shortly be running through the tunnel. Twenty-five miles of the permanent way (single line) have been laid. The sorting sidings, locomotive and wagon sheds, the stations at Rugby, Brackley, and elsewhere are being pushed forward rapidly. The engineer in charge of the Metropolitan section has just issued the following report to the chairman and directors of the Company:—The covered ways and tunnels are now practically completed from Finchley-road to the bridge over the London and North-Western Railway. Southwards of that point every effort is being made to urge forward the work. Covered way is progressing at nine and tunnelling at eleven faces. Most of the bridges over the railway are completed. The covered way under Lord's Cricket Ground has been duly and punctually finished, in accordance with the agreement with the Marylebone Cricket Club. Active progress is being made with the Grove-road and St. John's Wood-road bridges, and with the coal yard. The foundations for the goods warehouse are now nearly all in, and those for the terminal station are in full progress. Contracts have been let for the whole of the buildings and roofing of the terminus station, and the work is being actively carried on. Roads No. 6, extending from Lisson-grove to Park-road, and No. 7, leading into Marylebone-road, are in a forward state. At Neasden 212,000 cubic yards of earth has been tipped upon the site of the sorting sidings, and the necessary bridge and culverts are well in hand. The contract for the locomotive and waggon sheds has been let.

The Willesden Board of Guardians have appointed Mr. Alfred Saxon Snell, F.R.I.B.A., as architect for their proposed new workhouse, infirmary, and cottage homes.

The Royal Music Hall, Holborn, was reopened on Monday after enlargement by the acquisition of adjoining premises, the greater portion of which is utilised as luncheon, supper, and grill rooms. The new front of the Royal is in terracotta, the design being in the Renaissance style of architecture, and this portion of the work has been carried out by Messrs. Doulton and Co. The ceiling of the principal approach to the vestibule is treated in a floriated design in fibrous plaster, and a large oval space in the centre has yet to be filled in by an artistic picture in oils. Messrs. Drew and Cadman are responsible for the fibrous plaster decoration itself. The hall has been embellished in blue, chrome, and gold by Bell, of Great Portland-street, and new stall seats in old gold Utrecht have been supplied by Lyon and Co., of Holborn. The new scenery is by Mr. Edmund G. Banks, of the Gaiety.

THE DUOMO, FLORENCE.—DESIGN FOR LAYING OUT CLIFFS AND ERECTING NEW PIER AT FELIXSTOWE.—OLDHAM BREWERY CO.'S MINERAL WATER AND BOTTLING WORKS.—ARCHITECTURAL ASSOCIATION EXCURSION SKETCHES.—NURSES' HOME, BRADFORD GENERAL INFIRMARY.—CHURCH OF STA. MARIA DEI MIRACOLI, BRESCIA.

Our Illustrations.

THE DUOMO, FLORENCE.

THIS splendid photograph of this magnificent building needs but little introduction, and so complete an illustration cannot fail to be interesting and useful, particularly to the student. Arnolfo di Cambio, who was born in 1232, is the architect to whom the credit is due for the first conception of the great Duomo at Florence. A decree was passed by the burghers in 1294 to build a church which should surpass in grandeur and magnificence all other known cathedrals. They gave the commission to Arnolfo, the designer of Santa Croce. To say, however, that he was the architect, in any exclusive sense, would be misleading, seeing that, of course, the Duomo became, like the churches of Sierra and Orvieto, a school of architecture and sculpture for centuries. The first stone was laid in 1296. Giotto's Campanile dates from 1334, and Brunelleschi's Dome A.D. 1420. Arnolfo died in 1310, and probably at that date the building had reached the springing of the vaults. The nave and smaller domes were doubtless completed, as we now see them, during the first twenty years of the 14th century. We illustrated the west front of the Duomo in our issue of March 12, 1888; and the mosaics and marble-work of the building, with a view of the Campanile from the east, in our number for April 30, 1886; the baptistery, and the famous monument to Pope John XXIII., by Donatello, in the BUILDING NEWS for Feb. 3, 1893.

SELECTED DESIGN FOR LAYING OUT THE CLIFFS AT FELIXSTOWE.

WE illustrate to-day, by perspective, plan, and elevation, the design by Mr. Brightwen Binyon, F.R.I.B.A., of Ipswich, recently selected in competition for laying out about 800ft. frontage of the cliffs and grounds beneath the existing public gardens at Felixstowe. The competition was promoted by the Felixstowe Spa and Winter Garden Company, who offered a premium of £50 for the design placed first, and stipulated that the outlay incurred in carrying out the scheme, including the provision of concert-pavilion, reading and refreshment-rooms, lavatories and cloak-rooms, should not exceed £15,000. It will be seen that Mr. Binyon's design provides for a central building, containing billiard, refreshment, and cloak-rooms, over which is a concert-hall or winter garden, 86ft. by 55ft., with reading, smoking, and dining-rooms, facing the sea, and opening on to a promenade along the front of the site, under which are arranged beach-houses, that will take the place of the present unsightly bathing-huts. The concert-hall is near the new central railway station, now in course of construction, with loop lines of access, by the Great

Eastern Railway Company. This hall is lighted principally from the top by a glass pavilion roof, having a promenade round, with a bandstand and wind shelters to the front. The buildings and grounds are entered from the beach in the centre, and also from the cliff gardens. The grounds have been divided into three, and the building is so arranged that it can be carried out in sections:—The first, the centre portion, containing the concert-hall and beach-huts; the second, the portion to the west of the existing zigzag steps and path, containing the spa and baths, and also a continuation of the promenade; and the third portion consisting of a continuation of the promenade to the east, as far as the end of the site. The design has been arranged with the view to the subsequent building of a pier—an attraction urgently needed to enable Felixstowe to take its rightful status as a popular seaside resort—starting from the level of the promenade at the centre of the range of buildings, and the grounds are laid out with paths and tennis courts, with summer huts and seats at intervals.

BOTTLING AND MINERAL WATER DEPARTMENT, ETC., FOR THE OLDHAM BREWERY CO., LIMITED.

THESE premises have a frontage to Oldham-street of 129ft. and are 58ft. deep; they are divided absolutely into two departments, one being for beer bottling and the other for manufacture of mineral waters. Each department is complete in itself, having separate washhouses, loading docks, &c. In the basement it is divided into two large and lofty cellars, the boiler-house being in centre and under washhouse; the cellar on left-hand is used as bottling cellar, the other as storage for bottled beer. The top floor is devoted to syrup rooms and rooms for storage of empty bottles, &c. Small office and hoist are provided, the latter having Worrall's patent hoist-gates, which open and shut automatically, worked by the mechanism of the hoist itself. The hoist was provided and fixed by Messrs. Barker, of Oldham, who also fixed crane in bottling cellar, used for lifting barrels of beer on and off the stillages. There is a chimney 30 yards high. Cellar floor is formed of concrete, finished with granite face. Centre floor is fireproof, having steel girders and joists filled in with concrete and finished with patent rock asphalt, rendering same waterproof. Top floor consists of 3in. tongued and grooved plank-ing fixed on strong joists and iron beams. The whole of the ceilings are boarded with pitch-pine boards and varnished. Roofs to washhouses have continuous lantern lights, with strong glass louvres, and are glazed on top with patent glazing. Glazed bricks have been largely used in bottling-rooms and washhouses. All staircases throughout are entirely of cast iron. The areas in front are finished with Hayward's patent prismatic lights. All rain-water pipes are of strong lead and are fixed inside, recesses in walls being arranged to receive same, and covered with movable boards, the bottoms of each stack being provided with patent trap and inspection chamber for cleaning out. The whole of inside walls, also front outside, are faced with plastic bricks. The contractors for the building were Messrs. J. and D. Blunn, of Oldham, the architect being Mr. Charles T. Taylor, A.R.I.B.A., 10, Clegg-street, Oldham.

ARCHITECTURAL ASSOCIATION EXCURSION TO LANCASHIRE.

FOLLOWING up and completing our illustrations of this excursion, we publish this week a double page of reproductions of some excellent photographs of the clipped yew-trees in the front garden at Levens Hall, and the panelled Yellow Bedroom in the same mansion, and the courtyard of Borwick Hall—all three taken by Mr. F. Turner, of Morecambe, and the courtyard at Hoghton Tower, by Messrs. C. Simms and Co., of Manchester. The buildings were described in our last issue, p. 212-4, when other illustrations of Borwick and Levens Hall were given.

NURSES' HOME, BRADFORD GENERAL INFIRMARY.

THE foundation-stone of this building (illustrated herewith) is intended to be laid by the Duke of Devonshire on August 30. The total cost of the structure, when complete and furnished, will be about £10,000. Accommodation will be provided for over fifty nurses, the majority of whom occupy a house adjoining the infirmary grounds, now rented by the infirmary authorities, the lease of which expires in three years. The basement will contain kitchen, scullery, larders, storerooms, boiler-room, linen stores, boxrooms, and a porter's lodge at the north end. The ground-floor will contain

the main entrance, which will be on the east side, next the infirmary gardens; opposite the entrance is a staircase, which occupies an open well from bottom to top of the building. This floor comprises a matron's-room, visitors'-room, nurses' parlour, probationers' parlour, two studies, lavatory, sewing-rooms, eight bedrooms, and two bathrooms. The first and second floors above are very similar to each other, the first floor containing twenty-one bedrooms and the second twenty bedrooms, one of the latter being double the size of the ordinary bedrooms, and to be used as a sick-room. The contractors' names are:—Masons and joiners, Messrs. W. Ives and Co., Shipley; slater, Mr. James Smithies; plumbers, Messrs. Stead and Hutton; plasterers, Messrs. B. Dixon and Co.; painter, Mr. S. Lupton. The architects are Messrs. Milnes and France, of Bradford.

CHURCH OF STA. MARIA DEI MIRACOLI, BRESCIA, ITALY.

THE name of the architect of this church has not been handed down to us. Indications point to some master of the Venetian school, probably Pietro Lombardo, or Scarpagnino, as the designer of the plan. All we know is, that in 1487 the construction was already under way, and that in 1488, one Jacobo made provision for certain enlargements. Burkhart, who, in his "Geschichte der Italienischen Renaissance," 2nd edition, page No. 123, gives the ground-plan of the edifice, calls it a "centrifugal structure," a "fragment of splendour gone mad." The plan is very peculiar: a square nave, subdivided by four pillars into nine squares, of which four are surmounted by domes differing from each other in dimensions, giving the whole an air of whimsicalness rather than that of a serious solution of an architectural problem. Of far greater moment, artistically, than the interior is the main façade, fronting on a narrow street, the Corso Vittorio Emanuele, it being, at least in part, one of the most sumptuous performances in the Decorative Renaissance style. This façade owes its origin to the labours of several architects, who were successively engaged upon it. The central portion, erected about 1505, which is the older and the finer part of the façade, is undoubtedly the work of Gian Gasparo Pedoni, of Cremona. Four high pilasters, lavishly ornamented, flanking an entrance porch of most peculiar design, with a slender Venetian gable over it, the style of the structural framework, the lack of correct feeling for the logic of architectural forms, notwithstanding the great beauty of detail,—all these points are readily explained by the Venetian origin of the work. The upper story, as also the bare side-wings, which latter stand in no organic relation whatever to the interior of the building, are later additions, dating from 1612. The dry and uninteresting architecture of these later portions which it has been sought to enliven by the addition of clumsy urns and vases, and by statues over the side doors, shows the difficulty of the task of completing, with straitened means, an edifice begun in too lavish and expensive a style. We are indebted to the *American Architect and Building News* for this illustration.

The town council of Aberdeen passed plans on Friday for new buildings to cost about £20,000, including a proposed Unionist club in Union-terrace.

The pulling down of the old buildings on the site of the Oriental Palace of Varieties, Camberwell, has been commenced, and the tenders for the new building were opened on Thursday in last week, at the request of Mr. W. Hancock, the architect, at the office of Mr. H. E. Pollard, who has prepared the quantities. The tenders will be considered at the next board meeting.

A work by George Morland, entitled "Rabbiting," has just been added to the collection in the National Gallery. It is numbered 1497, is hung in Room XX., and has been bequeathed by Joseph Towers Smith.

Collins's music-hall, Islington, was closed on Saturday night for three months at least, for reconstruction by plans by Mr. Woodrow, architect, of Chancery-lane. The works will include an enlarged front with granite pilasters and bevelled windows. The stage is to be of greater width and depth, and there is to be a stage door and extra exits into the Essex-road. The whole of the seating accommodation in the balcony and gallery is to be rearranged, while the boxes also will be remodelled and added to. The ceiling will be treated in plastic decoration, and the general tone of the embellishments will be white and gold. The floors throughout the building—gallery, balcony, stalls, &c.—are to be carpeted. Mr. Charles Dearing, who is to do the rebuilding, is one of the four proprietors of the hall.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 60s. 0d. gold). To France or Belgium, £1 6s. 0d. (or 35fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXI. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIV., LVIII., LX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—A. F. W.—R. E. I. Co.—P. L. V.—C. P. C. and Son.—T. L. M.

Correspondence.

CARDIFF NEW TOWN HALL AND LAW COURTS.

To the Editor of the BUILDING NEWS.

SIR,—As will be seen from your advertising columns, Cardiff contemplates the erection of a Town Hall and Law Courts on a scale befitting its importance as a centre of wealth and population.

For this purpose the corporation have lately purchased from the Marquis of Bute a finely timbered park of some 60 acres. This magnificent site is bounded on its south by "The Feeder," an artificial but beautiful river by which the waters of the Taff are carried to the docks. There is a singular charm about this rapidly flowing stream, here entirely overarched by trees, with the lawn and garden around the ruins of the Grey Friars Monastery on the one side, and the park aforesaid on the other.

The spot appropriated to the buildings in question is within a stone's throw of "The Feeder," and not three minutes' walk from the centre of the life of Cardiff; yet, scarcely a trace of the near neighbourhood of a great town is visible from it. This is partly accounted for by the fact that the grounds of Cardiff Castle bound the Park to the west, with only a road and canal intervening. It struck the writer on visiting Cardiff that the corporation had secured an unrivalled site for their future municipal buildings.

It is to be hoped, therefore, that something worthy of the opportunity may result from the competition which has been determined upon for the buildings in question. The time allotted for the work is short; but, from the circumstances of the case, cannot be extended. The conditions are, I think, more favourable than usual.—I am, &c., A. WATERHOUSE.

20, New Cavendish-street, W., Aug. 19.

Intercommunication.

QUESTIONS.

[11740].—Decay of Brick and Stone.—Would some of your readers kindly refer me to any published paper or article dealing with the decay of brick or stone in any description of building? I desire to learn what methods have been recommended with the view of prevention of such weathering.—G. ABBOTT.

[11741].—Bath Rate.—I have let a bath into a kitchen floor with waste-pipe going under floor on to trap outside. I have no taps whatever connected with bath, but have L boiler behind kitchen fire, and tap at front, that I can connect a loose pipe to fill bath. Can the urban council claim bath rate for same?—W. WRIGLEY.

[11742].—Local Surveyor Retaining Plans.—Building Line.—A short time ago I deposited a set of plans for villas with the local authorities of a suburb (seven miles away) of London to submit to the fortnightly meeting of their building committee. The plans were prepared in accordance with the by-laws of the district. After the meeting, I received a letter from the surveyor, stating that the plans were rejected, and several alterations were required. I called at the surveyor's office naturally expecting to take the plans away to make the alterations; but, to my great surprise, the surveyor refuses to let me have them, and will not allow them to be taken away from his office on any account. He says I can alter them there; but, as the plans are the contract drawings, and have been very carefully prepared, also we have no copy, it will be no good doing so. The surveyor will give no explanation of his extraordinary way of doing business, and states his time is too valuable to waste in arguing the matter. I have been in business some 17 years, and passed some hundreds of plans, and never known a similar case. We propose building the villas upon a new estate (no houses on at all at present), and the building line is marked for all the plots. The surveyor insists that we must not build the bay window beyond the building line; but the front wall of bays is to be considered the building line. I have always found that the front wall of the house (main wall) is the building line, and any bays, &c., are allowed to project. If we have to comply with the surveyor's unreasonable demands, it will make a very serious difference in the value of the proposed buildings. There are no houses near at hand for him to refer to as a precedent.—F. C. T.

[11743].—Constants.—In Professor Banister Fletcher's textbook on Quantities, I see there are tables of constants by the multiplication of which the price of labour is obtained. I may say I am unable to ascertain how it is done. Mr. Fletcher says in the following tables it will be necessary to multiply the constant by the rate per hour of the workman, which will give him the price of labour. To this must be added the cost of material, and the total will give the estimated prime cost of the work, and, being in the painting trade, I am desirous of knowing exactly what they mean?

Painting in Common Colours.

First or primary coat, per yard super.	16h.
Second and following coats, each	14h.
First coat on iron	25h.
Second and following coats	16h.
Sash squares, each side, first coat, per doz. squares ..	50h.
Sash squares, each side, second coat, per doz. squares 40h.	

The above are the tables given. Where I am lost is what these figures or constants represent. Are they seconds, minutes, or hours? Could you illustrate to me what priming would cost per yard super. with wages at 8d. per hour? In the constants for joiner's work, he gives doors, if flush one side or bead butt, 2½ framing; the constant is figured like the following, 1.30 hour. What would be the cost of labour per foot. super. with wage of 9d. per hour and a constant like the above?—J. CALDERBANK.

[11744].—Slow Combustion Floors.—I shall be obliged if any of your correspondents can give information re solid wood flooring (for warehouses, &c.), known by the above name, now constructed; relative cost and strength compared with ordinary boarding and joists, and whether approved by leading fire insurance companies?—AN OLD SUBSCRIBER.

[11745].—Artificial Stone.—I would thank the writer of an article on artificial stone and marble compound, signed "W. C. S." on p. 217, last issue, for a formula to finish the exposed surface, about ½ in. thick, of Portland cement concrete to resemble Dumfries red sandstone.—OVER THIRTY YEARS A PURCHASER OF THE "BUILDING NEWS."

[11746].—Drainage of Street House.—Will some reader answer the following? There is a soil-pipe coming down the corner of the house and the kitchen offices at the back, which goes into a drain which passes below the rooms of the house to the front. An unpleasant smell is sometimes experienced in the back room—probably through a leakage or defective joints of the drain-pipe. Which is the best course to adopt? Should there be a disconnecting trap at the foot of soil-pipe in the yard, or is a chamber necessary? The soil-pipe has no ventilator. Is it necessary to have one? Does not this require an inlet for air somewhere in front? Advice will oblige.—A HOUSEHOLDER.

[11747].—Sketch Plans.—I prepared two or three pencil sets of plans for a villa to be built about 70 miles from London. The gentleman approved of one set, and agreed to have them carried out. He subsequently wrote to say he would get a local builder who had built houses on the estate to carry the plan out. As I have not heard anything since, I suppose he has come to terms. What can I charge for my preliminary plans, (1) supposing the house is being built, and (2) supposing nothing further has been done?—PERPLEXED.

[11748].—Deduction of Brickwork for Window Openings.—Will a practical reader say how the dimensions are taken in deducting window openings? Whether the width and height should be taken to the inside recess in the case of a wall two bricks thick?—A YOUNG ASSISTANT.

[11749].—Height of Chancel.—Is it not considered better and less expensive to make a chancel the same width and height of nave, so that the same roof can be used? A chancel arch and the masonry of gable, coping, &c., over it adds to the cost I am told. Is this so? Are there other considerations?—SIGMA.

[11750].—Bending and Jointing Block-Tin Pipe.—Will any plumber or pewterer who has had experience in working the above kindly give a few hints? I have to replace a 2 in. lead suction pipe with block tin, and having had no previous experience in either bending or jointing the above, find I cannot get on with it.—THE OLD HAND.

[11751].—Trigonometry.—I shall be obliged if one of your readers will give me the solution to miscellaneous question No. 8 in Galbraith's "Manual of Plane Trigonometry":—"Calculate the distance a person must recede from a pillar 60ft. high in order that it will subtend an angle of 45°, the height of his eye above the ground being 5ft.—STUDENT.

[11752].—Cement for Marble.—Can any correspondent recommend a thoroughly trustworthy cement for marble? I have tried recommendations in which water-glass forms a part, but cannot get it dry.—MARMO.

[11753].—Floor for Tent.—I require a portable floor for an army regulation tent, 40ft. in circumference. Will any of your readers who have constructed or used one give me information on the following points? (1) The most portable and strongest form of floor, as the camping ground will be in the Highlands of Scotland? (2) Plan of construction, and method of fastening segments or parts together? (3) What is the strongest and lightest material that can be used? The location of the camp will only be changed once a month or so.—CAMPESTOOL.

REPLIES.

[11714].—Stone Measurement.—I may have misunderstood "T. M. Garrood's" question. The sketch he gave of four mullion stones cut out of a block 1ft. 11in. by 15in. showed, as I understood, the dimensions allowed by "G." The stonemason says he should be "paid for the square that each block might have come out of." "G." now explains that the mullions were actually cut on the job out of blocks of stone in sections of fours, as shown in sketch. If that is so, I do not see why the stonemason is not satisfied with the measurements allowed. I was under the impression that the mason had cut each out of a separate stone, and that the sketch showed only the way they could be cut out.—READER.

[11738].—Defective Materials.—"Lex" will find cases that bear on defective material occasioned by architect's neglect in "Rogers v. Janes," 1891, "Badgley v. Dickson," 1886. These chiefly relate to certifying as proper or complete work which is defective, and in which improper materials have been used. If an architect uses an employer for his commission for services, and the latter counterclaims for damages on the ground that, by reason of his architect's negligence and want of care and skill, the work had been done in a defective manner and with bad material, the counterclaim, if established by evidence, will be maintained. I am not aware of any recent case of an architect being sued for damages for allowing defective material; it is hard to prove that an architect is responsible for bad material, although by neglect in superintendence such material may be introduced, and there an action would lie. Hudson, on "Building Contracts," may be referred to.—G.

[11737].—Construction of Subways.—The Boston subway is one of the most recent. This subway is constructed chiefly of concrete, brick rings in arches, with waterproofing with plaster and asphalt. The cross-sections given in the *Engineering Record* give several kinds. One of these sections shows a double and single-track subway, one track higher than the other, but both constructed of concrete with brick arches, one 13ft. 6in., and the other 14ft. 9in., both forming a "double-barrel" subway. Under Tremont-street is a subway double track 25ft. 7in. wide, with side walls, floor, and haunches of concrete, and brick arch tied by a 1½ in. iron rod 2ft. apart, about level with the haunches of arch. The outside of walls and bottom of invert is of waterproofing. The wide subways have arches of 2ft. thick, the side-walls near the middle of their height is 3ft., and is increased to more than double this thickness where it joins the invert. At its foundation the subway of 23ft. width occupies a width of 34ft. The height of crown above invert is nearly 18ft. Refuge niches are hollowed out on side walls at every 20ft. In the sections of double barrel subways, vertical I beams are shown imbedded in the side walls with tie-rods connecting the tops of every pair of opposite beams. The subways have a coating of asphalt entirely round them; in some places a coating of cement plaster is under the concrete. The depth of the subways or inverts varies from 26ft. to 37ft. below the surface of street, so as to permit the water and gas-pipes to remain. New sewers have been laid down on each side, connected with the house-drains. Some of these single-track subways unite with the main subway in a bell mouth, and in these junctions brick arches spring from one side wall to the other; the arches have heavy concrete backing, and are strengthened by vertical I beams 8ft. apart imbedded in the concrete side walls and tied together. I have only given a few details of the main sections, which are illustrated in the journal referred to.—G. H. G.

[11733].—Asbestos.—"A Constant Reader" will find all particulars about this material in R. H. Jones's work, just published, entitled "Asbestos and Abestic," a notice of which appeared last week in the BUILDING NEWS, p. 214. For plastering walls and ceilings, the abestic plaster is excellent—light, sound, and fireproof, and does not require sand or hair.—AN ARCHITECT.

[11739].—A Disconnecting Trap.—There are several excellent cleaning traps in the market. I can recommend the "Improved Kenon" disconnecting trap made by Thos. Crapper and Co., of Marlborough-road, Chelsea. It is well known and largely used, and has the advantage that easy means of cleaning are provided by a brass cap, which screws on, and the passage of sewage is facilitated by the egg-shaped section of the trap at the bend. Send for particulars and price-list.—G. H. G.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

NORTH-WESTERN SANITARY INSPECTORS' ASSOCIATION.—The members of the North-Western and Midland Sanitary Inspectors' Association held their annual excursion on Saturday at Wall Grange, near Leek, on the invitation of the Staffordshire County Council. Representatives from Liverpool, Bootle, Waterloo, St. Helens, Bromborough, Lymm, Wigan, Ince, Hindley, Penmaenmawr, Rhyl, Clitheroe, Crewe, Stafford, Hanley, Burslem, Handsworth, and other districts, assembled at Stoke, from where they proceeded by waggettes to Wall Grange. A halt was made at the pumping-station of the Staffordshire Potteries Waterworks Company, at Wall Grange, where luncheon was served. Afterwards the chair was taken by Dr Reid (county medical officer of health, Staffordshire), and a business meeting was held. An adjournment was made to the new asylum works at Cheddleton, where the party was received by Mr. Pebworth, clerk of the works to the Staffordshire County Council. Mr. Pebworth read a paper dealing with the drainage and plumbing work which had been executed under his superintendence, and a detailed examination was made of the various sanitary appliances. At 5.45 the members were driven to Stoke, a call being made at the works of Messrs. Johnson, Limited, pottery manufacturers.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—The session 1897-98 of the Institute will be opened on Monday, November 1, when Professor George Aitchison, A.R.A., will deliver his presidential address. The subsequent meetings will be held at 8 o'clock on the following Monday evenings:—November 15 and 29, December 13, January 17 and 24, February 7 and 21, March 7 and 21, April 4 and 18, May 2 and 16.

YORKSHIRE SANITARY INSPECTORS.—On Saturday the members of the Yorkshire branch of the Sanitary Inspectors' Association met at Wakefield. The members assembled at the Town Hall, and were formally introduced to Mr. Henry Smith, the Mayor, in his parlour, by Mr. A. Whitaker, the sanitary inspector for the city. The Mayor having offered the members a very cordial welcome to the city, the visitors then drove to Wakefield City Council's large reservoir at Ardsley, which will hold 320,000,000 gallons of water. After luncheon at Wakefield Town Hall the annual meeting was held in the Council Chamber, Dr. T. Pridgin Teale, of Leeds, the president, taking the chair. Mr. A. Whitaker, of Wakefield, and Mr. W. Chadwick, of Sandal, were elected auditors, and the president was unanimously re-elected. Mr. W. Kemp, chief sanitary inspector at Harrogate, read a short paper, intitled, "Should sanitary authorities give a certificate, under the hand of their sanitary inspector, as to the perfect sanitary condition of any house within their district at a fee to be charged by the said authority?" Mr. Kemp said that personally he did not see any objection whatever to this course being adopted; in fact, he thought every householder should have a guarantee that the house he or she lived in was in a perfect sanitary condition. If the system were adopted, it would be the means of bringing to light many insanitary premises which might never come under observation, and it would be a protection to visitors to our health resorts. He contended that no stipulations should be made by the authorities as to the conditions upon which a certificate should be granted; it should be left to the inspector to satisfy himself whether the premises were in such a sanitary condition as would justify him in giving a certificate without jeopardising his reputation as a sanitary inspector. A discussion on the paper was opened by Mr. Denham, of Tadcaster, and was taken part in by Messrs. Sykes, of Holmfirth; Wilkinson, of Altfotts; Lindley, of Batley; Darley, of Leeds; Drake, of Huddersfield; and the president. The visitors afterwards inspected the County Council's buildings.

The Corporation of Ipswich have under consideration an extensive scheme proposed by the Great Eastern Railway Company for greatly extending the siding accommodation in the neighbourhood of the dock, river, and waterside works. Some years since the corporation obtained a private Act for making a dam and bridge across the river near the main entrance to the dock, but allowed its powers to lapse, and the G.E.R. Co. now propose to carry out a similar undertaking, provided the consent of the corporation and of Parliament are given.

LEGAL INTELLIGENCE.

IN RE DIXON BROTHERS.—At Barnstaple, on Friday, before Mr. Registrar Bosson, Messrs. Dixon Bros., the contractors for the construction of the Wooda Bay Pier, near Lynton, appeared for their final examination in bankruptcy. The statement of affairs disclosed the gross liabilities to be £10,102 14s. 6d.; expected to rank, £10,092 14s. 6d.; assets, £943 17s. 3d.; and deficiency, £9,148 17s. 3d. The Official Receiver (Mr. George Philpott) observed that the partnership between the brothers was entered into in October, 1892, without any capital on either side. Mr. John Dixon, the father, appeared to advance money from time to time. In 1895 the partnership was dissolved. Although the statement gave the assets as £943 17s. 3d., £940 of that amount was not likely to be realised. Mr. Thomas Oliver Dixon, examined, admitted that a young man named Edward Britton, whom he had since discovered was then a minor, was employed on the works at Wooda Bay Pier. He supposed Mr. Britton, who had accepted three bills, was a creditor of the firm. Walter John Dixon, the other debtor, also examined, said that he did not know Britton was a minor when he first saw him. The arrangement was that Britton should take a quarter share, otherwise a half of his debtor's share in the business. Britton was an architect, and lived at Torquay. He had accepted the bills drawn by debtor, amounting to £208. The examinations were closed.

REGISTRATION OF TILE DESIGNS.—GODWIN AND HEWITT v. J. H. BARRATT AND CO.—In the Lord Chancellor's Court on Saturday, August 7, an application of considerable interest to tile manufacturers was heard by Mr. Justice Stirling. This was a motion on the part of Messrs. Godwin and Hewitt, tile manufacturers, of Hereford, for whom Mr. Jenkins, Q.C., and Mr. Philpot appeared, for an injunction against Messrs. J. H. Barratt and Co., Booten Road Tile Works, Stoke-on-Trent, to restrain them from selling the design of a tile registered in the plaintiffs' name at the designs branch of the Patent Office, Chancery-lane, and numbered 218,298, and from applying the same or any colourable imitation thereof to any substance or article of manufacture, and in particular for manufacturing any tile made so as to resemble those of the plaintiffs', and from selling, or offering, or exposing for sale any substance or article of manufacture to which the said design had been applied. The defendants denied that the tiles sold by them were an imitation of the plaintiffs' registered design, which had been registered in September, 1893, and through their counsel (Mr. Graham Hastings, Q.C., and Mr. Sebastian) moved in return for an order to rectify the Register of Designs by removing therefrom the plaintiffs' registered design, number 218,298, on the ground of anticipation, and that there was no novelty or originality in such design. The plaintiffs' design was applied to a 6in. square tile, and was of the ordinary brick pattern made by many manufacturers—that is, divided into 4in. by 2in. and 2in. by 2in. alternately, with the exception that the plaintiffs' tile was bevelled all round, and the sub-divisions were also bevelled, giving it the effect of a combination of bevelled edge briquettes or small tiles. They claimed for it that they were the first to apply this combination to a bevelled tile. The defendants admitted this; but alleged that as early as 1890 small bevelled-edge tiles were made, which, when placed together, had precisely the same effect as the plaintiffs' design, and unless a piece of work were examined very closely, it would be impossible to detect the difference or to say whether it were composed of separate small tiles or of the plaintiffs' registered design of a combined tile. Upon the question of imitation, defendants pointed out important differences which existed between their design and that of plaintiffs, which they were charged with imitating. The plaintiffs' design was the ordinary brick pattern, with a right-angled bevelled division and a bevelled edge. The defendants' was a brick pattern; but their bevel was of the slightest possible character, so as to admit of being easily cleaned, and each briquette into which the tile was subdivided had a pronounced white line running round the edge of the bevel, which made it impossible for the one tile to be mistaken for the other. Numerous affidavits were read on both sides, and the points for decision were whether the application of a bevelled edge to a divided tile, which produced an effect already obtained by means of separate tiles, and which was already in use in connection with a grooved tile, were a novel and original design which ought to be admitted to registration under the provisions of the Patents' Designs and Trade Marks Act, 1883-1888; and if so, whether the defendants had infringed the design of the plaintiff. Mr. Justice Stirling, in giving judgment, said: "This is a motion to restrain the infringement of copyright in a design claimed by the plaintiffs in the action. The copyright is granted in respect of a claim which is in these terms: 'Design for pattern of embossed tile to be made in any size.' Therefore, what is granted is copyright in a design for a pattern. The motion is met, not

merely by denial of infringement, but by motion for rectification of the register, by taking off the plaintiffs' name from the register in respect of this design, on the ground that it was not made novel or original, which it must be in order to satisfy the words of the Act. Now, it is proved—and it is not denied—at the time when this copyright was granted, tiles had been made of the form before me, the pattern of which consists of three rectangles and three squares, put together in this form; and the pattern is embossed on the tile by straight grooves of varying depth in the tiles, which had actually been made before the date, and have been exhibited before me. Now, what does the pattern of the plaintiff consist in? The pattern consists exactly of the same straight lines, with the difference that, instead of being made by a simple groove, there is a bevel, and the bevel is found not merely along these several marks, but at the edge of the tile itself. First of all, what is the law applicable to the case? That was settled by the Court of Appeal in the case of 'Le May v. Welch,' reported in the 28th Chancery Division, p. 24. Lord Justice Fry put it very shortly: 'Unless the design be in substance either novel or original, it is not novel or original within the meaning of the Act.' He further laid down that, in determining whether that design is substantially novel or original, you must have regard to what you see, and answer it mainly by the eye. Then I have a very short question before me: I have to look at the two tiles which I have before me—that which was in use before the plaintiffs' copyright and that which the plaintiffs have copyrighted; to say whether, as I see them, the plaintiffs' design, the plaintiffs' pattern, is novel or original. It appears to me that it is not. I cannot see that the shape of the grooves or bevelling of the edge of the tiles really makes a substantial difference in the pattern. In my judgment, therefore, the defendants' motion succeeds, and the plaintiffs' application therefore fails. That is quite independent of any conclusion which I might come to on the plaintiffs' motion as to infringement; but I must say that, as regards the infringing tile, to my eye, again—I speak simply by the eye—the defendants' bears much less resemblance to the plaintiffs' than does the plaintiffs' tile to the one which preceded it." Plaintiff's counsel thereupon applied that the motion might be treated as the hearing of the action, to which the defendants' counsel made no objection, and the action was then dismissed with costs for the defendants.

UNSUCCESSFUL CLAIM AGAINST AN EMPLOYER.—The Judge of the Rochester County Court and a special jury on Saturday investigated a claim for £300 made by a journeyman carpenter named Varrall against his employer, Mr. Charles E. Skinner, a builder, of Chatham, for the loss of four fingers while at work at a circular saw, which the plaintiff alleged was defective. After hearing evidence the jury returned a verdict for the defendant, being of opinion that the saw was in good condition and that the accident arose through the plaintiff's handling the wood and saw unskillfully. The Judge said he was glad that by a recent Act of Parliament such cases would be settled by arbitration in future.

NEGLECT TO GIVE NOTICE.—George Walsham, of 35, Woodland-hill, Norwood, was summoned to the South-Western Police-court on Saturday, at the instance of Mr. Percy Hunter, district surveyor for Norwood, for infringing the Building Act by failing to give notice of his intention to begin a building at 33 and 35, Woodland-hill, and neglecting to comply with a notice of the surveyor requiring him to do certain work. Mr. Hunter said the premises in question were divided into two parts, one being used as a laundry and the other for a dwelling house. The defendant had cut down the party wall that divided the premises, and the Clause 74 of the Building Act of 1894—which required the erection of such party wall—had been inserted in the Act because of a fire that had occurred in the district at a milliner's shop, whereby some shop assistants lost their lives. The defendant had now re-erected the wall, so that all danger was removed; but the existence of such a wall was very necessary for the protection of workpeople. Mr. Marsham fined the defendant 20s. for the first offence; but on the second summons decided that the surveyor need not have called on the defendant to do the work, as it was done before the notice was sent. He accordingly dismissed the second summons, with 10s. 6d. costs against the surveyor.

"QUITE LEGAL IN AMERICA."—At the Liverpool Police-court on Friday, John George Houston, alias Davies, was charged with obtaining £60 from sundry persons by means of a false advertisement. He had advertised in Liverpool and Leeds papers that J. Davies and Co., 62, Dale-street, Liverpool, required a time-keeper over some building operations on an estate in Cheshire, and when the applicants presented themselves he required from £10 to £50 deposit as security. Several complied. The prisoner, who is a naturalised American, when apprehended, said he intended to engage a man at 40s. a week to work at a house he intended to build, and then when the ground floor was reached

he would mortgage the house, and pay back the security money. That kind of business, he added, was quite legal in America. The prisoner was committed for trial.

STATUES, MEMORIALS, &c.

LYMINGTON.—At the last meeting of the town council approval was given to the plans of the monument which is to be erected over the grave of the late Mr. Coventry Patmore. The memorial will be subordinate to a churchyard cross, which is to be placed near the centre of the Roman Catholic portion of the inclosure. It consists of an obelisk, placed on a square pedestal, raised on three steps, symbolical of the Trinity. There will be at each angle of the junction of the obelisk with the pedestal a sculptured lion, the meaning of which in connection with the obelisk will be readily understood by the readers of "Religio Poeta." On three sides of the upper portion of the pedestal will be engraved the name of the poet, and the dates of his birth and death. At a lower level they will be adorned with panels symbolically carved. Above will be represented the Cross and Host, rising from a stem from which spring lilies entwined with the initial letter of the Virgin's name, and below will be the laurel wreath denoting that the poet's powers were devoted to the honour of Christ and His mother. This design will be inclosed by a band in the form of a vesica piscis, on which will be the legend, "My covenant shall be in your flesh," and in the spandrels the letters A.M.D.G. In the corresponding panels on either side will be inscribed passages from Patmore's writings in prose and verse. The fourth side, which will be immediately in front of the churchyard cross, is to be left plain. The material will be Irish limestone. The memorial has been designed by Mr. Basil Champneys, B.A.

Mr. C. H. Shannon has been awarded a gold medal of the first class at the International Exhibition of Munich for his picture, "The Wounded Amazon," which appeared in this year's "Pageant." Sir Edward Burne-Jones also received a first-class gold medal for his "St. George and the Dragon" series, and Mr. John Swan for his drawings of animals.

Last week Mr. Robert H. Bicknell, inspector to the Local Government Board, held an inquiry into the application of the Croydon Corporation to borrow sums of money amounting in the total to £72,300 for improvements within the borough, including £32,000 for new waterworks at Waddon. Evidence in support of the application was given by Mr. Thomas Walker, the borough engineer, who was supported as to the waterworks by Sir Frederick Bramwell, Mr. W. Whitaker, Mr. Edward Easton, and Professor Boyd Dawkins.

The finance committee of Aberdeen Town Council had under consideration on Friday the question of the appointment of an assistant burgh surveyor in succession to Mr. Lynam. After a discussion and division, it was decided that the duties pertaining to the office of burgh surveyor and city architect respectively were so separate and distinct that it was inexpedient to combine them, that the committee appoint an assistant burgh surveyor, and that the question as to the office of city architect be continued for further consideration. Mr. Gordon, at present in the surveyor's office, was recommended to the appointment of assistant burgh surveyor at a salary of £200 for the first year, rising by £25 per year to £300. The report was adopted by the town council on Tuesday.

The Viscountess Raincliffe opened on Friday, at the Mechanics' Institute, Scarborough, a bazaar in aid of the restoration of the church of All Saints', Thwing, near Hunmanby. The church dates back to the 12th century, and contains Norman work. It is proposed to preserve all its ancient features, but the pews will be replaced by open seats. The old font, which had been removed from the church and was lying in a garden in another parish, has been repaired and restored. An estimate of partial restoration is £750, and of entire restoration £1,000. The parish is purely agricultural; it contains a population of 375, has no resident squire, and is six miles from a railway station.

The new station at Mauchline, on the Glasgow and South-Western Railway, with increased waiting-room accommodation, was opened last week. The new premises, situated a little to the north of the old buildings, are built of Ballochmyle redstone and rough-cast, consist of a large booking-hall, agent's room, parcels office, and booking-office, ladies' waiting-room, gentlemen's first-class waiting-room and dressing-room, and a general waiting-room. On the opposite side of the main line there are now two waiting-rooms.

The Gloucester Union Board of Guardians have appointed Mr. Alfred Saxon Snell, of London, and Mr. Walter B. Wood, of Gloucester, as joint architects to their proposed new workhouse, infirmary, and cottage homes.

Our Office Table.

THE curriculum for the session 1897-98 of the Architectural Association has just been published, containing particulars of the various classes and courses of lectures held in connection with the "A.A." at the studios, 56, Great Marlborough-street, W. The lecturers and instructors include Messrs. Henry Adams, Percy Buckman, Max Clarke, A. O. Collard, J. E. Drower, F. R. Farrow, Alfred H. Hart, F. E. Hulme, W. G. B. Lewis, F. W. Pomeroy, H. B. Ransom, H. E. Satchell, R. Elsey Smith, and A. W. Weedon; and among the prizes offered is the Association Travelling Studentship, value £25; the A.A. Medal, with ten guineas; the Essay Prize, value ten guineas, with silver medal; the Architectural Union Company's Prize, value ten guineas; the Arthur Cates Scholarship, value ten guineas; Measured Drawings Prize, value five guineas; and the Andrew Oliver Prize, value five guineas. Scholarships are also awarded in the school of design, and silver and bronze medals in the studio. The annual courses of lectures recommence on Monday, October 11.

On the previous Friday evening, October 8, the ordinary session of the Architectural Association will be inaugurated at the R.I.B.A. meeting hall, 9, Conduit-street, W., by an address from the President, Mr. Hampden W. Pratt, to be followed by the distribution of prizes gained last session. The subsequent meetings for the session will, as in previous years, be held as nearly as can be arranged on alternative Friday evenings at 9, Conduit-street, commencing at 7.30. The following are the names of the lecturers and the subjects of the papers:—Oct. 22, "Practical Lessons from the Bazaar Fire at Paris," by Mr. Edwin O. Sachs; Nov. 5, "Classification of Trades," by Mr. S. Flint Clarkson; "Some New Materials for use in Building," by Mr. H. D. Searles-Wood; Nov. 26, *Conversazione*; Dec. 3, "The Planning of High Schools and Endowed Schools for Girls," by Mr. J. Osborne Smith; Dec. 17, "House Painting," by Mr. L. A. Shuffrey; Jan. 14, "Composition in regard to Public Buildings," by Mr. Frank T. Baggallay; Feb. 4, "Hampton Court Palace," by Mr. John Belcher; Feb. 25, "Lead Work, Plain and Decorative," by Mr. F. W. Troup; March 11, "Scottish Ecclesiastical Architecture in the 14th and 15th Centuries," by Mr. Hippolyte J. Blanc, of Edinburgh; March 25, "Constructional Steel-work," by Mr. T. C. Cunningham; April 22, "The Morality and Economy of Competitions," by Mr. H. B. Cresswell; April 29, *Members' Soiree*; May 6, "Interior Lighting by Reflected Lights," by Mr. W. Eckstein, and "Electric Lighting as Applied to Architecture," by Mr. Tom Ekin; May 20, "Foundations as Applied to London Bridges and Riverside Foundations," by Mr. A. T. Walmisley; and May 26 (Thursday), Annual Dinner. The dates of the Saturday afternoon visits are fixed for Feb. 5 and 26, March 12 and 26, April 23, May 7, June 4 and 18, July 2, 16, and 30, and August 20, the annual excursion being arranged to occupy from August 8 to 13, 1898.

ONE of the first effects of the report of the Commons Committee as to the risk of fire at the South Kensington Museum will be the removal of the "Brompton Boilers," which have so long been an eyesore to the neighbourhood. The work of demolition of these ugly store-chambers will be commenced at once. H.M. Office of Works has decided, with the concurrence of the Treasury, that the unsightly iron building which was constructed three years ago on the quadrangle in the very centre of the museum, adding greatly to the risk of fire, is to be removed without delay. Protests against the erection of this temporary shed were made at the time, and have been frequently renewed. Further structural alterations with a view to minimising the danger of fire are also to be undertaken by the Office of Works, these including, it is said, the construction of new refreshment-rooms for the use of students of the Royal Colleges of Art and Science.

Mr. M. H. SPIELMANN writes that, although by the Treasury minute of July 22 it was stated that Mr. W. H. J. Weale, the Keeper of the Art Library at South Kensington Museum, and who has reached the age limit of 65, would "be allowed to serve another year before retiring," he has been summarily dismissed from his post. Mr. Spielmann adds: "People will assuredly see in this action swift punishment, an act of

retributive injustice, in respect to the witness from the Science and Art Department who dared to give hostile evidence before the committee as to the administrative faults of South Kensington Museum so far as they came under his notice. It may fairly be asked—What will be the effect of this strange act on any other South Kensington official who may be called upon to give evidence when the committee resumes next session? There can surely be but one answer."

THE unique street of Georgian houses known as Church-row, Hampstead, which has preserved its charming air of seclusion up to the present time, is now threatened by the speculating builder. The site of the "fine, old, well-set-back house" at the right of the row as we enter opposite the church, with its cottages and garden, the freeholder now proposes to clear and build over. The houses on either side of the other end next the churchyard have each a strip of land next them, and in the case of each of these it is the ambition of a speculating builder to acquire the house and land and erect a block of buildings over the site thus obtained. It is pleasant to learn from Mr. Ambrose Poynter, the secretary to the National Trust, that in these two last cases there are obstacles which will most likely make it impossible for the schemes to be carried out. In the other instance, the only hope of preserving the present old-world aspect of the building is for those interested to buy the property and maintain it in its present condition, and to this end a meeting of those who wish to preserve Church-row will be convened early next week, at which a definite practical proposal will be brought forward.

THE current generalisation that the bigger an order the cheaper you can get it, the larger the quantity produced the greater the economy in production, does not apply universally. At the last quarterly meeting of the Ipswich Town Council the paving and lighting committee reported that they had accepted the tender of Messrs. Jewson and Sons, of Norwich, for the supply of 250,000 wood blocks at the following prices:—First 50,000, £5 5s. per 1,000; second 50,000, £5 7s. 6d. per 1,000; for 150,000, £5 10s. per 1,000. A good deal of surprise was expressed at the graduated rise in price. One of the town councillors explained that the difficulty had been in getting the larger number of blocks. Merchants were not able to supply so many within a given time, while they found it comparatively easy to supply 50,000 only. Hence a smaller quantity was obtainable at a cheaper rate.

THE borough surveyor of Blackpool has submitted to the members of the town council his scheme for widening the promenade. He shows that the present promenade varies in width from 24ft. to 70ft., and the footpath from 5ft. to 17ft. The scheme, which will probably be put before Parliament for sanction, provides for a footpath 10ft. wide on the east side next the houses, a carriage-way 55ft., an island footpath 10ft. wide, a raised track for a double line of trams the whole length of the Promenade 20ft. 9in. wide, and then the promenade footpath, with a uniform width of 42ft., faced at the side by a sloping hanking of 15in. granite sets. The sea-wall will be exactly like that on the North Shore works, and will run on the same level till it meets the new promenade opposite the south end of the Tower, where it will join the upper one. The concrete of which it will be constructed will be 7ft. thick, and faced above the granite hanking with concrete blocks and coping. The estimates state that the cost of the section from the south end to the Manchester Hotel will be £117,896; the second section, from the Manchester Hotel to the Royal Hotel, £98,661; and the third section, as far as the North Shore Promenade, £132,424, a total cost of a little under £350,000. The scheme has already been considered by the Council, and awaits final decision.

A MEETING was held at the Queen's Hotel, Huddersfield, on Friday, of a number of master builders from most of the Yorkshire towns—particularly the districts of Holme, Colne, and Spen Valley—to consider the advisability of forming a federation for Yorkshire. The chair was occupied by a local master builder, and the meeting was well attended. Representatives were present from the Lancashire Federation of Master Builders, who explained the objects and working of that society, and the success which had attended it working. It was mentioned that since the federation had been formed there had been fewer strikes, and a mutual good feeling had been engendered between the masters and opera-

tives. The meeting passed a resolution affirming the general desirability of establishing such a federation, and steps were taken to form one. Preliminary rules, on the basis of the Lancashire Federation, were adopted. Broadly, the objects of the federation are to enable contractors to make more satisfactory terms with architects and engineers with respect to agreements and the carrying out of contracts; also, for the better conduct of the working rules with the operatives. It is part of a general movement which is taking place in the North of England. The next meeting will be held at Leeds on Sept. 15.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Architectural Association. Visit to Sutton Place, Guildford. Waterloo Station Main Line. 12.45 p.m.

CHIPS.

The organ in Linton Parish Church, Kent, was repaired on Saturday after having been enlarged by Mr. James Turrell, of Greenhithe.

The last ceremony performed by Prince Ferdinand during his visit in Rutchuk was the inauguration on Sunday of the works of the new railway from Rutchuk to Timovo, which it is proposed to extend across the Skipka Pass to Adrianople, forming a new route to Constantinople.

The city council of Truro received at their last meeting a report from a committee recommending that the cattle market be paved. The city surveyor reported that the estimated cost would be £661 if paved with bricks, £671 if paved with old granite setts taken from streets, £1,063 if paved with new granite setts, and £1,173 if paved with wood blocks. The committee recommended the last-named course, and, after a long discussion, it was adopted.

Another fatality occurred on Friday morning at New Brighton Eiffel Tower, now in course of construction. Thomas M'Grath, labourer, of Derby, was working on a platform 80ft. high, when by some mischance he slipped, and, falling to the ground, was instantly killed.

The extent of building operations in London is illustrated by the returns of the great water companies. In July of last year these companies supplied 332,120 houses, while in July of the present year they were supplying 346,646. Thus, within the twelve months there has been an increase of 14,526 separate services—or, to put the matter in another way, there have been built 14,500 houses.

Colonel Durnford, R.E., a Local Government Board inspector, held an inquiry at Levenshulme on Friday with reference to an application of the Levenshulme Urban District Council for the Board's sanction to borrow £3,850 for works of private street improvement in Clare-road, Griffin Grove, Henderson-street, Berrie-grove, May-grove, and Manchester-street, which will be paved and put in repair.

The death occurred last week, at Bâle, his native city, of Dr. Jakob Burckhardt, who co-operated with Kugler in the second edition of the "Handbook of the History of Art." He was a graduate of Berlin, and became professor of the history of art in the University of Bâle. He was the author of a number of books on art and history, the best known, perhaps, being his "Cicerone," a guide to the ancient and modern art of Italy.

The work of relaying the roadway in the centre of North Bridge-street, Edinburgh, to suit the gradient of the new North Bridge, was commenced at midnight on Saturday, and was carried on throughout Sunday and during the week. The new roadway had to be raised about 4ft. at its lowest end, where it meets the southern end of the bridge, and in order to accomplish this, and leave the pavement on each side untouched, the edges were constructed of brickwork, on which the gradient was carried out southward till it met the old street level at the Tron Church. The centre of the street will now accordingly present one gradient from the Register House to the Tron Church. Along with the roadway there had also to be laid a new track for the trams. The contractors, Messrs. Dick, Kerr, and Co., have about 300 men and over 100 horses and carts engaged. The material requisite to raise the roadway amounts to about 900 tons.

Mr. W. R. Slack, R.E., a Local Government Board inspector, held an inquiry at the Salford Town Hall on Tuesday with reference to an application of the town council for permission to borrow a sum of £1,500. The Salford borough engineer has recommended that a new bridge be built, connecting Lower Broughton with Peel Park. The present footbridge, which is of the suspension type, was erected in 1839, and is only 6ft. wide. It is proposed to erect a substantial bridge at a cost of £1,500. It will be 3ft. wider than the existing one. There was no opposition to the application.

Trade News.

WAGES MOVEMENTS.

STATE OF TRADE DURING JULY.—The monthly memorandum prepared by the Labour Department states that during the past month the state of employment on the whole remained stationary, and is still better than a year ago. In the 113 trade unions making returns, with an aggregate membership of 465,561, 12,371 (or 2.7 per cent.) were reported as unemployed at the end of July, the same percentage as at the end of June, compared with 3.1 per cent in the 109 unions, with a membership of 427,441, from which returns were received for July, 1896. Employment in the building trades continued brisk; the percentage of unemployed in unions making returns was 1.3, compared with 1.5 in May. The percentage for July, 1896, was 1.8. The furnishing trades, though still well employed, were scarcely so busy. The percentage of unemployed union members at the end of July was 1.9, compared with 1.5 in June and 2 per cent. in July of last year. Sixty-five fresh disputes occurred in July, 1897, involving 46,539 workpeople, as compared with 66 involving 15,871 workpeople in June and 85 involving about 19,000 workpeople in July, 1896. Of these, sixteen disputes took place in the building trades. Of the 79 new and old disputes, involving 12,380 workpeople, of which the settlement is reported, 35 involving 2,429 workpeople were successful from the workpeople's point of view, 19 involving 4,829 workpeople partially successful, and 25 involving 5,122 workpeople unsuccessful. Changes in wages affecting about 32,200 workpeople were reported during July, of which number 31,500 received increases and 700 sustained decreases. The net result is an average advance estimated at 1s. per head on the weekly wages of those affected. Changes affecting about 3,100 workpeople were preceded by strikes, and changes affecting 20,000 workpeople took place under sliding scales. The remainder, involving about 9,100 workpeople, were arranged by negotiation or otherwise.

BELFAST.—The plumbers' strike in Belfast, which had lasted six weeks, was amicably concluded on Friday. The men are to receive an advance in wages of $\frac{1}{2}$ d. per hour, and a satisfactory arrangement was come to with regard to the apprentice question. As a set-off to the concessions made by the masters, the men have conceded several points required by the employers. The men returned to work on Monday.

KILMARNOCK.—At a meeting of the operative joiners of Kilmarnock on Thursday night in last week, it was resolved to come out on strike on Saturday, in consequence of the masters having refused to grant an advance of $\frac{1}{2}$ d. per hour in the rate of wages, the present rate being 8d. per hour. The employers, replying through their secretary to the men's demand, which was made three months ago, say that the state of trade does not warrant an advance.

LORD PENRHYN'S QUARRYMEN.—A large number of quarrymen arrived in the Bethesda district on Saturday evening, owing to a report that the negotiations for a settlement were pending, and that the quarries, which have been closed nearly a year, would be in full swing the next week. To their disappointment, it was stated there was not the slightest foundation for the report, and that the prospects of a settlement there are as remote as ever.—It was announced, however, yesterday (Thursday), with some show of authority, that the terms of settlement of the Penrhyn quarries dispute have been agreed to between Mr. Young, the manager, and the men's committee, and only await confirmation by Lord Penrhyn, who is in Norway, and the men, who meet on Saturday night. The terms have not been disclosed.

PAINTERS AND THE EIGHT HOURS' DAY.—The National Amalgamated Society of Painters and Decorators, the members of which number nearly 8,000, have passed a vote in favour of the eight-hours' day. The society belongs to the federated trades, the other members of which are now voting to the number of 20,000.

PETERHEAD.—A meeting of masons, carpenters, plumbers, painters, blacksmiths, and others concerned in the building trade in Peterhead was held in the Palace Hotel there on Thursday night in last week for the purpose of forming a building trade association. There was a large attendance, and it was resolved to form the association, with Mr. Wm. Stuart, builder, as president; Mr. John Stuart, plasterer, as secretary; and Mr. John Ferguson, plumber, as treasurer. The aims of the association are to put every tradesman on the same level in making estimates for work by the adoption of schedules. Hitherto most of the new work in and about Peterhead has been undertaken from plain measurement and specification; but the trade in all departments have resolved now to insist upon schedules, so that "extras" may be executed at scheduled prices.

PLYMOUTH.—The second step towards the complete settlement of the strike in the Three Towns building trade has been arrived at. The dispute with the carpenters was the first to be smoothed away. Now it is the plasterers' turn, and the labourers are alone left in the field against the masters. Several meetings between the Plasterers' Society and the Master Builders' Association have taken place lately, and chiefly as a result of a concession on the part of the men, by which employers are permitted to take an extra apprentice on during the last six months of the service of their eldest apprentice, the Association have agreed to the terms of the plasterers. The strike, so far as this body is concerned, has lasted fifteen weeks, although (as Mr. Denbow, the secretary of the local branch of the Society, points out) during the past eight weeks it has been merely the semblance of a dispute, as the branch has only recorded an average of eight men on strike, the numbers at times having dwindled down to two or three. Strike pay has been given at the rate of 24s. per week.

STAFFORDSHIRE NAILMAKERS.—The 5,000 wrought-nail makers in the Staffordshire and Worcestershire districts, who have been out on strike during the last five weeks, returned to work on Monday afternoon, the whole of the employers having granted an advance ranging from 10 to 12½ per cent.

THE BRICKMAKERS' STRIKE IN THE BLACK COUNTRY.—One of the largest strikes which has been known in the Oldbury district for many years past commenced on Friday, when between 700 and 800 brickworkers turned out for an advance of 20 per cent. in wages. An unusual amount of bitterness appears to have been introduced into the strike, and the men allege that this is owing to the action of the employers in refusing to concede any advance whatever, and in declining to meet the men or their representatives in conference, and, finally, in deciding to close the works after Friday. A mass meeting of the men was held in Hunt-street, Oldbury. Mr. S. Lakin (district secretary to the National Union of Gasworkers and General Labourers), who presided, said the masters had treated the men's application with contempt. All the brickworkers in the country had received an advance except those in South Staffordshire. Many of the Oldbury brickworkers were being paid 25 per cent. below the rates paid to their fellow workmen in other districts. The masters in the Birmingham district would not assist the employers in the Black Country, and the Birmingham operatives were willing to support them during the struggle. He alluded to the conditions under which the operatives laboured, and mentioned that a gang of ten female workers in the Oldbury district received 13s. 4d. for making 18,000 bricks. Those bricks were sold for 30s. per thousand, and yet the masters said they could not afford to pay an advance. He found that the price paid for moulding bricks in Birmingham was 4s. 10d. per thousand for common bricks, and 12s. 6d., 18s., 19s., and even £1 per thousand for the better qualities, and yet at Oldbury the masters were getting 18,000 made for 13s. 4d. The Building Trades' Federation had expressed their sympathy with the men on strike. It was decided to continue the strike, and to take steps to obtain funds for the support of the men. In reply to Mr. Lakin, the employers say: "The conditions of manufacture in Staffordshire are altogether different to Garrison-lane, where hand-labour only is employed; but when we have to make bricks under similar conditions we pay from 7s. to 8s. 6d. per thousand, as compared with 4s. 10d. in Garrison-lane. We deny that we get 18,000 bricks made by machinery for 13s. 4d., the lowest price being at least 25 per cent. more than this, and in many instances makers are paying more than 50 per cent. over these figures." Letters have been written to the papers stating 3s. per day was paid to marlhole-men. In reply, the employers say: "The lowest price paid to marlhole-men is 4s. per day, ranging up to 4s. 9d." The manufacturers add: "Having regard to the fact that in 1890 we gave an advance of 15 per cent., when bricks were selling at the same prices as they are now being sold at, and that during four to five years of very bad trade, in which low prices were obtained, we continued paying the increased wages, as we are doing at the present time, we consider that their present demand is most unreasonable and unjust, and one which leaves us no alternative but to strenuously resist. The prices of bricks to-day are at least 30 per cent. lower than stated by Mr. Lakin." In various parts of the Black Country building operations have come to a standstill. The local demand for bricks appears to be exceptionally brisk, and it is expected that the stocks in the yard will soon be exhausted.

Mr. E. Moir, the agent of Messrs. S. Pearson and Son, the contractors, during the construction of the Blackwall Tunnel, has been presented by the staff engaged on the tunnel with a pair of handsome silver candelabra as a mark of esteem and a souvenir of his association with this great engineering triumph.

LIST OF COMPETITIONS OPEN.

Barnmouth—County Schools	No premium	John Lloyd, 1, Glanywersedd-terrace, Barnmouth	Aug. 24
Bury, Lancs.—Art Gallery and Public Library (£16,000 limit)	£75, £50, £25	John Haslam, Town Clerk, Bury, Lancs	" 31
Wadhurst—Memorial Hall, Club, and Library (£2,500 limit)	£20, £10	W. Jarroomb, Hon. Sec., Wadhurst	" 31
Lower Basington—Sewerage Scheme	£50, £35, £20	Joseph Young, Surveyor U.D.C. 72, Stanley-terrace, New Ferry	Sept. 1
Sunninghill and Sunningdale—Sewerage Schemes	No premiums	The Clerk, Windsor R.D.C., Park-street, Windsor	" 4
Ipswich—Higher Grade School, Tower-st. local Competition	No premium; 5 per cent. com.	J. Hepburn Hume, Clerk to School Board, Ipswich	" 14
Skipton—Cottage Hospital (16 beds. £2,500 limit—no assessor)	£15, £5	W. H. Dawson, Hon. Sec. to Committee, Skipton	" 16
Battersea—Baths and Washhouses, Battersea Park-road	£100 (merged), £50, £25	W. M. Wilkins, Vestry Clerk, Municipal Bldgs., Lavender Hill, S.W.	" 22
Blanenau Festiniog—County Police Buildings	£15 15s.	J. Morris Jones, County Surveyor, Trawsfynydd, Merioneth	" 25
Morecambe—Sewerage Scheme	£100	Jno. Bond, Surveyor, U.D.C., Morecambe	Oct. 1
Ludlow—Electric Lighting Scheme	£20 (merged)	John H. Williams, Town Clerk, Ludlow	" 1
Leeds—Wholesale Dead Meat Market and Abattoir	£100 (merged), £50, £25	John Harrison, Town Clerk, Municipal Buildings, Leeds	" 8
Mexico—Legislature Palace (1,500,000 dol. limit)	15,000 dol. Mex.	Secretary Public Works, Mexico City	Nov. 30
Cardiff—Town Hall and Law Courts (A. Waterhouse, R.A., Assessor—£200,000 limit)	£500 (merged), £300, £200	J. L. Wheatley, Town Clerk, Town Hall, Cardiff	Dec. 4
Newcastle-on-Tyne—New Infirmary local Architects	(No first) £150, £100, £50	Secretary, Building Committee, Newcastle	(1898) Jan. 1
Carlton, Victoria—Children's Hospital	£100, £50, £25	J. Nicholson, Hon. Sec., Potham-street, Carlton, Australia	(1898) Jan. 30
New York—Sun Dial (Plaster Model)	500 dol., 250 dol.	J. Nicholson Sculpture Soc., 215, West 57th-street, New York	(1898) Feb. 28
Brighton—Artisans' Dwellings (local Architects only)	£75, £25	E. J. Tiltstone, Town Clerk, Brighton	"
Lewisham—Free Library £4,000 limit	25gs.	Edward H. Oxenham, Clerk, Town Hall, Catford, S.E.	"
Boscombe—Hospital Enlargement, Shelley-road	"	J. Pratt, Assistant Sec., 126, Christchurch-road, Boscombe	"
Tottenham—School Board Offices	"	J. F. Adams, Clerk, School Board Offices, Tottenham, N.	"
Forest Hill—Free Library £4,000 limit	25gs.	Edward H. Oxenham, Clerk, Town Hall, Catford, S.E.	"

Ipswich—Additions Rose Hill Schools	E. F. Bishopp, Architect, 32, Museum-street, Ipswich		"

THE BUILDING NEWS AND ENGINEERING JOURNAL.

VOL. LXXIII.—No. 2225.

FRIDAY, AUGUST 27, 1897.

DEVELOPMENTS OF BUILDING.

A FOREIGN expert in architecture, if asked to describe our English modern development of the art, would certainly find it difficult to do so. He would, no doubt, describe the buildings in our great thoroughfares as a mixture of English and foreign types—mostly foreign; and if asked to give a more particular answer, he would probably say that Italian and French Renaissance prevailed, but that nearly every conceivable style could be found. And this opinion would express the fact. No country is so eclectic in its tastes as England, or has borrowed so much from other countries. Even our language has been derived from about a dozen different sources; our literature is enriched by the myths and legends and poetry of every Classical and Oriental nation. And this great diversity in literature and art may owe its origin, not merely to our insular position, but chiefly to the diverse elements which have combined to produce the race and civilisation. In other Continental countries the expression of architecture has been more definite and special. In France, for instance, as in Italy, it has been distinguished for its maintenance of Classic traditions. Sometimes a Baroque or Rococo character prevailed, as it did in the reign of Henry IV. and Louis XIV., when all restraint was thrown off; but generally it has preserved that dignified Classical taste which began with the Early Italian Renaissance of Francis I., and was afterwards succeeded by the style of the Empire early in the century. Even now she is still French Classical in her taste, and has never given way to those wild and eccentric tastes like the Louis Quatorze or Rococo, which for a short time held sway. Other countries, like Germany and Spain, preserve a national character—the Classical feeling prevails more or less. The German Renaissance is less pronounced than it was before the War; but in both these countries the Classical taste has been modified by national peculiarities and temperament, as in Spain we find a decidedly Moresque spirit in the details. Perhaps our American cousins are more like ourselves in their versatile tendencies; but of late a decidedly French Renaissance spirit has prevailed. But the conditions of architecture in this country are somewhat different. Latin influences or Italian tastes have never been strong; and then, the very opposite elements which constitute the English have tended to neutralise any particular partiality. We had a strong national Gothic architecture, and we cannot even now forget it; and all these influences have been detrimental to any strong individuality or pronounced style. And it must be remembered we had our Renaissance developments, the earlier phase of which was the Elizabethan, from which period till the later Revivals, we might boast of a distinctly national style of Domestic architecture. Who can deny, for instance, that in buildings like Rushton Hall, Kirby, Aston, and Moreton Halls, and other buildings of the 16th century, there is a distinctly English character, despite the Italian or French influences? These old Domestic buildings are clearly not of the same character as those of the same age abroad; they show that the Classical details were thoroughly adapted and naturalised to the vernacular or Gothic modes of building, and that the spirit of the latter actuated the architects. It was perhaps an unfortunate circumstance for our

national architecture that the later revival of Classic checked this development, and retarded by half a century the present condition of architecture.

Entering a little more minutely into the buildings of our streets, the stranger will find an equal diversity in the construction, in the materials used, and details of various kinds. There is greater evidence than can be found in any other country, save perhaps America, of engineering, iron construction, and other technical trades elbowing art. The critical observer cannot fail to notice that architecture, as an art, is struggling to retain its hold against great odds, and that it is even changing its tactics and altering its methods to do so. Faith in art for its own sake is no longer a power; men's minds are seeking direct results and commercial ends. The shop or the façade may be smothered in ornament; but it is apparent through all, however disguised, that the main effort has been to make the building, be it house, church, town-hall, shop, or factory, as cheap and commercial as possible. If it is a large shop or warehouse, the skeleton structure of iron pillars and rolled beams is scarcely hidden, but reveals itself in all its naked ugliness in every story, while the exterior walls form a thin shell of brick or terracotta on which all the architectural decoration has been expended, flimsy in its detail and exuberant in its excess. Solidity is absent altogether, and is sacrificed to the exigencies of space or to cheapness. All structural pillars and girders are incased with plaster, tiles, or thin slabs. Next door one sees a more substantial-looking block of offices of red brick, Georgian in character, with gauged arches, moulded and cut architraves and pediments, with white-painted sashes and dormers in the roof. The mouldings of brick and wood are well designed and solid looking, and the internal rooms and details show careful study and taste. A third block of offices has a stone front of several stories carried high up above surrounding buildings, its back wall broken by a deep recess, or open court, in the centre, lined with white glazed bricks to reflect light to the suites of offices, according to the regulations of the London Building Act. Such a diversity of buildings may be seen east of the Temple Gardens, in the new area for a long time a kind of "no man's land" between Tudor-street and the Victoria Embankment, where blocks of offices, large warehouses, as well as three well-known schools are built. We point to this area as one specially typical of our modern architectural development. Almost close to one another may be seen three or four important edifices. One devoted to education, another a theological library and college, a third dedicated to Euterpe. These are built of stone and red brick: the two schools are in different phases of the Renaissance, and the library and offices of the Thames Conservancy Board in Late Gothic. Thus in this restricted area we may see varied types of Renaissance, Georgian, the modern warehouse, and other nondescript styles which have been developed out of the exigencies of iron construction and the demands of commercial life. From Westminster to Blackfriars Bridge the silent highway passes by a few of the most typical modern buildings. One sees two or three recent examples of hotel architecture, in versions of Renaissance and Tudor, the modern office and residential blocks in a version of the French Château style, School Board offices, one of Chambers' stately Italian structures, and other new edifices in which the different schools of the Renaissance are represented. The critical stranger may fairly exclaim, "Where is the national English style?" as he beholds this array of modern buildings, where all schools and phases are represented. They are nearly all good imitations of the styles they represent, and show an intelli-

gent appreciation of the features of each. It would be hard to detect a preference for one style. In Sion College we have a specimen of Late Gothic that shows an intimate study of the period chosen, and the details are on the whole good; while next to it, the bold and well-proportioned City of London School is quite as strong an example of Italian Palladianism, and as a modernised example of Late Tudor verging on the Renaissance, Mr. Pearson's unique little block of offices at the corner of Essex-street may be mentioned. With these examples, the stranger's impression of our architecture will be somewhat mixed; but one thing he will notice, namely—a thorough study of each style, and an endeavour to honestly adapt features from each for our modern wants. Such opposite specimens of the Classic as those just mentioned to the red brick Georgian front of a block at the end of Bridewell-place are, indeed, almost startling, as showing how stone and brick can be utilised. In the last everything is of red brick—the brick modillion cornice, and the moulded work round the windows. We do not compare, on the other hand, the Fire Brigade Station, or even the Thames Conservators' Offices with the Gothic of Sion College, but they show a recrudescence of Late Gothic feeling for business purposes.

The employment of materials is equally remarkable. Thus, in Surrey and Norfolk streets, pile after pile of offices and commercial blocks may be seen, in which terracotta has been combined with brick; the City Bank on Ludgate-hill is one of Mr. Colcutt's best attempts to use the two for a bank. It is a greater success than the former; for the architect, to give breadth and produce a better result, has done precisely what we advocated the other day, namely, has built the lower story—the bank proper—in plain terracotta blocks, introducing a large arched window; while in the upper stories the material is used with brick, the details and turret being executed in the former. Even a bolder treatment is visible in a few of our recent buildings. At the corner of Wellington-street and the Strand, a very imposing block of shops and offices is erected, and nearing finish, in which both fronts are faced with terracotta of a warm buff colour. The style is a Free Renaissance; the upper stories are decorated with three orders of pilasters, ornamental window-dressings, and the low cupola-crowned turret on the return front is effective. Being at the corner of so important a thoroughfare from one of the principal railway stations to the south, it will be sure to attract notice. The work has been executed with much care, the terracotta has been supplied by the Burmantofts Company, and the work has been carried out by Messrs. Foster and Dicksee. The circular corner is varied by engaged three-quarter columns of the same material. The windows of the first floor have broken pediments, and the square architraves have joggled joints; a wide broken gable forms a feature in each front, and the roof is high, of green slates. The lower shop story is divided by polished granite pilasters. Other examples in Holborn, Oxford-street, &c., show how this material is developing a style of its own. The chief fault is the imitation of stone details which many of them affect.

Then various mechanical contrivances have influenced design, especially in the interior. Lifts, iron girders, metal construction, facilities for trade, lighting, sanitation, are gradually being recognised, but as yet in a tentative way. We have not yet the steel-frame building amongst us, but many approaches to it. No one will say they have been successes. So long as we use iron, and cover it up in all manner of ways, and make the outside something very different, this factor in the evolution

of our modern buildings will be destructive and unsatisfactory. At present we can only turn to the engineer's work, his bridges and railway structures, as being in any way a direct outcome of the iron utilitarian age. The question still remains: Which, if any, of these modern developments of our architecture can be said to possess any permanent value in the future? Is there any one style more than another likely to be made a starting point for a new departure? It seems impossible to believe that we can go on repeating half a dozen different styles, or that by constantly varying them according to individual taste, any agreement will be derived; but at least this may be asserted, that the multiplicity of modern wants and tastes favour the concurrent use of several methods of building, and render the adoption of one national style as a thing of the past.

RESPONSIBILITY OF ARCHITECTS.

CONSIDERABLE doubt exists among many in the profession as to the question of responsibility of architects. Very frequently correspondents write for information—as, for example, whether an architect is responsible for any defect in workmanship or materials discovered in a building which he has certified? It is, of course, impossible, in the absence of circumstances and details, to give any definite answer to these questions; but it is well that the younger members of the profession should be acquainted with certain legal principles and decisions by which general conclusions may be formed. We may first suppose a case of this kind. A building is intrusted to an architect in the usual course to superintend. Something is done wrong. The drains are improperly laid, or the roof is not watertight, and the client looks to the architect. Is he responsible if he employs a clerk of works, or delegates the details of the work to another? We may imagine a case where the architect has many works on hand, and that he can only give a general superintendence to any of them. It is unreasonable, if not impossible, to expect him to see to all the work—the laying and jointing of drains, the mixture of the concrete, and to look after the courses of the footings. At the same time, according to one decision (*Money-penny v. Hartland*), he is liable to his employer for defects, whether he delegates work to another or not. According to one ruling he is not entitled “to put implicit trust in a clerk of works appointed by the employer,” for if he passes inferior work he is liable in damages (*Lee v. Lord Bate-man*). These decisions are, it must be confessed, a little hard on the busy architect, who cannot inspect every part of a foundation, or see that every brick or slate is laid properly, or that every load of bricks that comes to the work is according to specification standard. If he engages a clerk of works, surely this ought to exempt him from such labour, and it does as a rule. We do not believe a clerk of works entitled to the name would allow any default of this kind to pass. But it may occasionally happen that a clerk of works has something else to engage his attention just when the concrete is being put in or the drains laid.

Official interpreters of the law are not all the same in their opinions. What is called “an ordinary and reasonable degree of skill” may mean very different things, as shown by the way various judges have expressed this rule. The skill of the architect need not be extraordinary: he must bring to the exercise of his profession an “ordinary degree of skill,” says one judge. In a recent case, another judge said an architect could not be held responsible for the defective joints in a drain, and if we extend the principle, it is unreasonable to expect him to see that every brick or stone

is equal to the requirements. As to the delegation of the architect's duties, an authority on the law writes: “An architect's or engineer's duties being personal, he cannot delegate or transfer them entirely to another; but he may make use of the skill and labour of others in performing his duties, provided that he does not abdicate his general duties as to superintendence and supreme control of the work.” And this more reasonable view of the architect's responsibility has been upheld. In the case of *Clemance v. Clarke* a very important decision was given which seems to have set at rest the question as to superintendence. Therein it was held that the architect's “duties could not be performed if he were expected individually to go over every matter in detail, and it cannot be that his certificate should be held bad by a court of law because he has not himself gone into every detail.” Recent decisions in America have supported the same view. In the measurement and estimation of work it is unreasonable to expect that the architect can do the work entirely himself. If he deposes an assistant to measure, and revises himself, he is carrying out his contract. As regards estimates, a reasonable degree of accuracy is expected. It has been said that a man should not estimate a work at a price at which he would not contract for it;—a healthful principle if it can be obeyed.

There are occasions in which the architect's responsibility is limited, as when the employer orders alterations and supercedes his architect's instructions. Let us suppose a not infrequent case. A house is being built according to plans and specification by a contractor. In the absence of the architect, and unknown to him, the employer orders casements to open inwards, and without specifying the right kind of joint to keep out the rain. These are found very defective, and allow wind and rain to blow through. The architect cannot be held answerable if the work is done without his knowledge. But if the architect follows his client's orders, without pointing out the consequences of this altered construction or giving proper details, he may be held liable for any defect. An experienced architect would not hesitate to point out the consequences of any alteration made by his client to him, as by so doing he holds himself harmless in case of any accident or defect. Sometimes a professional man is required to carry out the plans of another architect—say, in the case of the decease of the latter. In such a case he ought to carefully examine the plans and specifications of his predecessor, for if he neglected to do so, he could be held liable for any error or defect that may be discovered. An employer may wish his own plans carried out by an architect who may be let into a trap unwittingly if the plans turned out impracticable or defective. No doubt, if any mistake arose, which had not been pointed out to the employer, the architect might be held liable. The test of liability in all these and similar cases is to be found by proving that the architect has not used reasonable care and skill. Whether any men in the same profession would have done the same thing in like circumstance, or come to the same conclusion, is one means of discovering the liability or otherwise of the architect. The responsibility of the architect depends largely as to his use of usual and skilful means. If he neglects to employ them, he is liable for any damage resulting to the employer. It would be neglect on his part, for instance, if he failed to examine the site and foundations, the rights of support, of light and other easements, before making his plans; if he failed to comply with statutes and by-laws as to buildings; and he would also be liable if he neglected to test by his own skill plans made by others, which he undertook to carry out.

THE LAW AND BUILDING SOCIETIES: AN IMPORTANT CHANGE.

ON Wednesday, one of the most important sections in the Building Societies Act, which was passed upwards of three years ago, came for the first time into full force and operation. The section is the one which will in future regulate the power of these societies to receive money on deposit or by way of loans, and the far-reaching effect of this section was the reason which, at the last moment, led Parliament in 1894 to defer the operation of the clause for three years from the passing of the Act, which received the Royal Assent on the 25th August, 1894. Up to the time that this Act received the sanction of Parliament, building societies were, by a previous Act of 1874, enabled to receive money on deposit or by way of loans to an amount not exceeding two-thirds of the aggregate sum which had been lent on properties by way of mortgage. The disclosures which followed the failure of the Liberator and other less famous building societies led Parliament to call for a return from all building societies of what is known as their “properties in possession.” Out of 2,249 societies in England and Wales, 210 failed to give a return, “notwithstanding repeated applications by the Secretary of State,” whilst 681 acknowledged that their properties in possession stood in their books at £2,565,309, upon the security of which they were able to receive deposits to an amount not exceeding two-thirds of that sum. It was upon this startling return that the Government inserted in their Bill the clause, which takes effect from and after Wednesday, prohibiting building societies from receiving any money on deposit, or as a loan, upon the security of any property in the possession of the society, or upon any property on which the mortgage repayments are more than twelve months in arrears. At the time of the introduction of this clause into the Bill it was fully recognised that many building societies would have to overcome considerable difficulties in complying with its provisions, and to avoid forcing societies into liquidation, the House of Commons suspended the operation of the clause “until the expiration of two years from the passing of the Act,” and protected existing depositors by the insertion of a proviso, “That this section shall not affect the validity of any deposit or loan which was within the limit provided by law at the time when it was received.” In this form the Bill was sent to the House of Lords, where the operation of the clause was extended for a further period of twelve months, making three years in all. From the returns which have recently been made by building societies, it is much to be feared that, notwithstanding the three years' grace allowed by Parliament, little or no effort has been made by some societies to reduce their deposits and loans to within two-thirds of the amount of the mortgages upon which repayments are more or less regularly paid. This is in part due to the great difficulty of realising properties in possession for the purpose of paying off loans and deposits. Although the failure of a society to reduce its loans and deposits may not be held to affect the validity of the loans and deposits already taken, future depositors will do well to make sure that the sum already held by a building society on deposit or loan is well within the limits allowed by the new Act. Fortunately, the detailed series of accounts now required from all building societies clearly sets forth this information. Since the passing of this clause, the Chief Registrar of Building Societies has reported that, of the 210 societies which failed to make any return to Parliament of the properties in their possession, 61 have now sent in returns showing that they have properties in possession amounting to £1,117,709, and that 22 societies “who stated that they had no properties in possession” now acknowledge that they have properties to the amount of £23,263.

ANGEL HOTEL, BRIGG, LINCOLNSHIRE.

THE old building, which has stood some centuries, has undergone demolition and rebuilding as shown in the illustration. The new premises comprise commercial and coffee rooms, carriage entrance to the covered courtyard, and buildings in the rear; sitting and bed rooms, with a central balcony, on the first floor. The style adopted is half-timber Renaissance work overhanging the ground story. The ceiling timbers are in view, the windows and door panels are glazed with leaded glass, and all the internal

THE ANGEL HOTEL, BRIGG, LINCOLNSHIRE.

fittings are of suitable character, harmonising with the style of the buildings. The work has been carried out by Mr. H. Dent from the designs and under the superintendence of Messrs. Freeman, Son, and Gaskell, architects, of Hull, for the owner, Mr. J. H. Skevington.

THE BRITISH ASSOCIATION AT TORONTO.

WE give, in accordance with our custom for many years past, abstracts of some of the addresses delivered and papers read before the members of the British Association during the meetings in Toronto just concluded, likely to be of interest to our readers.

CANADIAN GEOLOGY.

In his address, as president of Section C, Geology, Dr. G. M. Dawson, C.M.S., F.R.S., pointed out that the nature and relations of the more ancient rocks of North America are problems particularly Canadian, for these rocks, in their typical and most easily read development, either constitute or border upon the continental protaxis of the north. A reasonably satisfactory classification of the crystalline rocks beneath those designated as palaeozoic was first worked out in the Canadian region by Logan and his colleagues, a classification of which the validity was soon after generally recognised. The greatest known connected area of such rocks is embraced within the borders of Canada, and the further understanding of the origin and character of these rocks is likely to depend very largely upon work now in progress, or remaining to be accomplished here. Dr. Dawson recapitulated from the time of Logan the first steps made in the classification of the crystalline schists in Canada, dwelling upon the substantial accuracy of these first observations. The general tendency of our advance in knowledge appeared to be in the direction of extending the range of the palaeozoic downward, whether under the old name Cambrian, or under some other name applied to a new system defined, or likely to be defined, by a characteristic fauna; and under Cambrian or such new system, if it be admitted, it was altogether probable that the Animikie and Keweenaw rocks must eventually be included. In other words, the somewhat arbitrary and artificial definition of the *Olenellus* zone as the base of the Cambrian seemed to be not only not of world-wide application, but not even of general applicability to North America; while as a base for the palaeozoic æon it was of still more doubtful value. In the Cambrian period, as well as in much later geological times, the American Continent did not admit of treatment as a single province, but was to be regarded rather as a Continental barrier between two great oceanic depressions, each more or less completely different and self-contained in conditions and history—that of the Atlantic and that of the Pacific. The lecturer regarded the comparatively

recent attempt to introduce an "Algonkian System," under which it was proposed to include all recognisable sedimentary formations below the *Olenellus* zone, assumed for this purpose to be the base of the Cambrian, as a retrograde step, wholly opposed not only to the historical basis of progress in classification, but also to the natural conditions upon which any taxonomic scheme should be based.

THE TRAINING OF ENGINEERS.

Mr. G. F. Deacon, M.Inst.C.E., of Liverpool, in opening Section G, that of Mechanics, devoted the greater part of his address to the question of the training of engineers. The work of an engineer demanded for its right performance the best energies of well-balanced minds working upon a store of knowledge which nothing but years of untiring study and observation could give. Yet there was no hesitation shown to enter the lists. The number of candidates was appalling. In the old country, at least, there certainly was not work for all; but when one pointed this out, anxious parents only replied that the difficulty was as great in connection with any other profession. Of those who entered the business or profession of the engineer, the enormous majority were not born engineers. Mr. Deacon continued: At the time I began practice, the large majority of young engineers were left entirely to their own devices so far as the attainment of any scientific knowledge was concerned. As pupils or apprentices, articled or not, they entered an engineer's works or office; for a certain number of years they had the run of the place and some encouragement if they worked well, but it could not, in the nature of things, amount to much more. Except to a few, such a training was entirely ineffectual in the production of that well-balanced attitude of mind which an engineer must hold towards every engineering problem which he is called upon to solve. In Westminster of late years, the young engineer enters an office at a much more advanced age than formerly. When it is essential that he should be earning something soon after he comes of age, anything like a complete training is an impossibility; his work ceases to be general, and his practice is more or less confined in a much narrower sphere than need be the case if the pursuit of further knowledge continues to be his chief duty. But whatever course his circumstances may permit him to adopt, the difficulty of gaining the required knowledge in the time available is a serious one. It is not desirable that when he leaves school his training should be specialised in view of the particular branch of the profession or business he is likely to follow. The fundamental principles of any branch of mechanical engineering are broadly the fundamental principles of any branch of the profession. The training demanded for the various branches of civil engineering in its narrower sense is precisely the same as that required in its earlier stages for mechanical

engineering pure and simple. Experience of the results as judged by the students who have come directly under my notice, and examination of many calendars, has aroused this thought: Are we not in some cases attempting at too early a stage the teaching of subjects instead of principles? Does not subject training at college, for the sake of some little anticipation of his office work, divert the attention of the student from the better mastery of those principles which it is so essential for him to grasp at the earliest possible time, and which do not limit his choice in the battle of life to any one branch of the profession or business of an engineer? If we observe the careers of exceptional men in our profession, we find the very reverse of specialisation. Of no class of men can it be said with greater truth than of engineers that their standard should be sound knowledge of the principles of many things and of the practice of a few. There is some danger in the usual limitation of compulsory subjects in examinations for certificates and degrees. When an examination has to be passed, subjects not made compulsory are too often entirely neglected, however important to the engineer they may be. As to that physical and mental training gained laboriously, and somewhat wastefully, at the joiner's bench, in the fitting and turning shops, the foundry and the forge, during the whole course of mechanical engineering apprenticeship, the kind of knowledge which comes of thoughtful chipping and filing and turning and forging, though only applied to a few of the materials with which in after life the engineer has to deal, is quite as important as tables of density and strength to his future sense of rightness in constructive design. The use of such work is not merely to teach one the parts and combinations of any particular machine; in a still higher degree it is the insensible mastery of a much more subtle knowledge or mental power, the application of the senses of sight and touch and force, to the determination of the nature of things. But the great workshop training has still further advantages. The apprentice is surrounded by skilled workers, from whose example, if he be wise, he learns a great deal; and apart from this, it is no small profit to have rubbed against the British workman, to have discovered what manner of man he is, and to comprehend how little the world knows of his best parts. The whole time spent in large engineering works cannot, however, be equally beneficial; the apprentice must take the work as it comes, and he often feels that some of his time is being well-nigh wasted. The impossibility of including experience in a workshop without neglecting something equally important led Mr. Deacon to view with satisfaction the introduction of workshop training into certain schools of applied science in England.

AN IMPERIAL HYDROGRAPHIC SURVEY.

Professor Alexander Johnson, of McGill University, read a paper in which he sought the advice and aid of the British Association in inducing the Imperial and Canadian Governments to act together in making the necessary arrangements for tidal observations, which, if found satisfactory, might possibly be extended to other colonies, and thus the basis of an Imperial hydrographic survey might be laid.

THE WORLD'S FUEL SUPPLY.

Lord Kelvin, speaking on the fuel and air supply of the earth, observed that all the known fuel on the earth is the residue of ancient vegetation. One ton of average fuel takes three tons of oxygen to burn it, and therefore its vegetable origins, decomposing carbonic acid and water by the power of sunlight, gave three tons of oxygen to our atmosphere. Every square metre of the earth's surface bears ten tons of air, of which two tons is oxygen. The whole surface is 124 thousand millions of acres, or 510 million millions of square metres. Hence there is not more than 340 million million tons of fuel in the earth, and this is probably the exact amount, because it is probable that all the oxygen of our atmosphere came from primeval vegetation. The surely available coal supply of England, Scotland, and Wales was estimated by the Coal Supply Commission of 1831, which included Sir Roderick Murchison and Sir Andrew Ramsay among its members, as being 146 thousand million tons. This is approximately six-tenths of a ton per square metre of area of Great Britain. To burn this quantity would take one and eight-tenths of a ton of oxygen, or within two-tenths of a ton of the total oxygen of the atmosphere resting on

each square metre of Great Britain. The Commission estimated 56 thousand million tons more of coal as probably existing at the present in lower and less easily accessible strata. It might, therefore, be considered as almost quite certain that Great Britain could not burn all its own coal with its own air, and, therefore, that the coal of Great Britain is considerably in excess of the fuel supply of the rest of the world reckoned per equal areas, whether of land or sea.

FORESTRY IN INDIA.

Lieutenant-Colonel Fred. Bailey read a paper on this subject in the Section of Geography. He pointed out that in early times the greater part of India was covered with forest, but the land not cleared for cultivation was, for the most part, denuded by over-cutting and over-grazing with burning. If denudation had not affected the climate generally, it had without doubt resulted in the drying up of springs and streams rising within the areas deprived of the shelter of a crop of trees; and this was a serious matter in connection with the question of irrigation by canals led from rivers not snow-fed, as well as in localities where damage had resulted from the formation of ravines and torrents. The permanence of the supply of timber and other forest produce for the use of the native population and for State purposes had also been endangered. When the Government wished to take action, its powers were found to be uncertain, for the destructive usages of the people had come to be regarded as inalienable rights; and it was necessary to pass a special Forest Law, which, among other things, provided for the formation of reserved forests, after a full inquiry had been made into claims, and for the regulation of proved rights within limits which would not endanger the permanent maintenance of the forests. In order to secure the forests from over-felling, and to insure that all work done might tend towards the production of the largest quantity of wood of the kind most desired, working plans were a necessity, and considerable progress had been made in their preparation. During the dry weather the forests became extremely inflammable, and vast areas have been annually burnt over from time immemorial, with the result of reducing the crop to the poorest possible condition, or of destroying it entirely. Measures had been taken to meet this great evil. The controlling staff of the Forest Department was trained in England, but the candidates followed a course of practical instruction in Continental State forests. The native Executive officers were trained at the Imperial Forest School at Dehra Dun. What had been done could not have been accomplished by private enterprise. The Government had set an example which had been followed by several of the more important native States. Much more remained to be done, but forest conservancy in India had reached a stage at which its steady progress could not be arrested.

THE STRENGTH OF COLUMNS.

Mr. Gaetano Lanza showed that an attempt to compute the strength of any given column by the various rules and formulæ commonly found in different handbooks, and books written by so-called authorities, would speedily reveal considerable discrepancies, not only in the formulæ, but also in the results. Hence it became a matter of importance to make a careful study of the tests that have been made, under practical conditions, on columns of such sizes and proportions as are used in construction. A summary was therefore given of the principal experiments that have been made of columns of practical sizes. The greater part of the tests contained in the list were made on the United States testing machine of 800,000lb. capacity, located at the arsenal at Watertown, Massachusetts. The details of these tests are published in special yearly reports issued by the Ordnance Department of the United States Government. Diagrams were presented showing (1) the results of the tests of cast-iron mill columns; (2) the results of the tests of wrought-iron bridge columns, and also empirical formulæ representing in each case the right-hand portion of the curve, which is concave upwards; (3) the results of tests of timber columns. A perusal of all the diagrams shows that, whenever the load on a column is so applied that its resultant acts along the axis of the column, the breaking load per square inch of sectional area is practically constant up to a certain ratio of length to radius of gyration, which in wrought-iron bridge columns varies from 60 to 80, and in a corre-

sponding way in timber columns. For higher values of the ratio of length to radius of gyration the breaking strength per square inch decreases, and the law of decrease can only be expressed empirically in each case. When, on the other hand, the load on the column is eccentric, this must be taken into account in our calculations, and the greatest fibre stress should always be computed by adding the direct stress per square inch to the greatest fibre stress arising from the bending moment due to the eccentricity of the load; and the column should then be so proportioned that the total greatest fibre stress shall not exceed a certain allowable fibre stress, which last must be a sufficiently small fraction of the breaking stress per square inch corresponding to the ratio of length to radius of gyration of the column. In the paper the results of the tests and the modes of computation, both for central and for eccentric loads, were treated in detail, and a discussion was given of the theories and formulæ commonly found in the handbooks which are, for the most part, based on the results of Hodgkinson's tests on small samples. Fuller attention was also called to the disagreement of these latter with the facts.

CALIFORNIAN CONIFERS IN ENGLAND.

Mr. G. P. Hughes gave a description and measurement of coniferous trees, grown from Yosemite Valley seed, conveyed by the author in 1874, and cultivated in England. The description of these conifers tends to show that most of the Californian and British Columbian species thrive well on congenial soil and stations in Great Britain, and that as trees or ornament, shelter, and commercial value they are well worth cultivating. Californian and British Columbian red wood now produced 1s. 11d. per cubic foot in the English market, yellow pine 2s. 6d., pitch-pine 1s. 6d. per cubic foot.

A WOOD-DESTROYING FUNGUS.

Professor Marshall Ward, the president of the Botany section, read a paper on "Sereum Hirsutum, a Wood-destroying Fungus." He has cultivated this fungus from the spores on sterilised wood blocks, and has not only obtained very vigorous pure cultures, and traced the action of the mycelium week by week on the elements of the wood, but has obtained spore-bearing hymenia, and worked out the life-history very completely. The fertile hymenium arises in about three to four months. In destroying the wood the fungus delignifies the inner layer of the walls of the wood elements, and in three months' cultures and upwards these turn blue in chlorzinc-iodine, and are shown by other reagents to undergo alteration to cellulose-like bodies before their final consumption by the fungus.

ELECTRIC TRAMWAYS.

Two papers were read in section G, Mechanics, on Tuesday, on electric tramways by Mr. J. G. W. Aldridge, of London, and Mr. G. C. Cunningham, chief engineer of the Montreal street railway system. Mr. Cunningham pointed out that though the first electric tramway was only opened in 1884, there were now 16,000 miles of such tramways in the United States and 1,200 miles in Canada, as compared with only 700 miles in the whole of Europe. He also compared the extremely low cost of electric as compared with horse traction. In the Brooklyn Heights Railway the cost was only 86c. per car mile, while in Liverpool the cost of horse-power was 5d., and in Glasgow 3½d. per car mile. (Here the cost of renewing the horse stock was included.) Perhaps the costs were not strictly comparable, but with every item included there could be no doubt that electric power was enormously cheaper than horse-power. Mr. Aldridge said in his paper that the United Kingdom had practically 130 miles of electric tramway at work or under construction; of this length 103½ miles were operated on the trolley or overhead wire system, 15½ miles by means of a third rail conductor, six miles by means of storage batteries, and only four miles on the underground conduit system. These proportions might be taken as fairly representative of other countries also, as far as could be ascertained. They seemed likely to be maintained, or even increased, in favour of the overhead wire system, unless radical improvements could be made in the direction of a cheaply built and maintained conduit method, or more durable and light accumulators for placing direct upon the car. Objections to the overhead trolley wire system were almost entirely æsthetic; but, at the same time, had such great weight and force that every incentive was

offered to the genius of invention to make improvements in other directions. The ordinary underground conduit with open slot was most expensive to instal and troublesome to maintain efficiently; it could not be built for less than £10,000 or £12,000 per mile. Even its latest form (consisting practically of an underground trolley wire) must require an outlay of nearly double the cost of an overhead-wire system. Closed conduits with surface-contacts, usually operated by means of an electro-magnetic switching device in boxes under the street level, were complicated and, it was to be feared, unreliable. The great weight of lead required on each car for accumulator traction mean practically that the live paying load could never reach 25 per cent. of the gross weight of loaded car, whilst the combinations of trolley wire and battery, attempted on systems like those of Hanover and Dresden, were obviously ill-designed, the dead weight of battery being carried throughout the entire journey, though only required for part thereof. The author concluded with a description of his own system, in which the continuous overhead wire was done away with, the car itself carrying a short length of wire overhead, and a series of pillars and studs in the roadway feeding the current to the car. The length of the car wire was such as to bridge over the gaps between the studs and pillars. The studs were only live while the car was over them, thus obviating any danger to the ordinary traffic. The current was conveyed to the studs and pillars by an armoured cable buried underground.

The protracted discussion which followed was joined in by Professors Ayrton, Thompson, and Perry, Mr. Scott, Major-General Webber, the President, the Recorder, and others. The general conclusion was that for suburban traffic, and for streets in large cities where the vehicular traffic was small, the simplicity and economy of the overhead wire system made it the only possible system to adopt, and that the wires need not be at all unsightly if the feeders were underground. For the important streets of great cities, on the other hand, the more costly system would have to be adopted.

THE NEW CONGRESSIONAL LIBRARY, WASHINGTON.

THE old Congressional Library at Washington has been closed, and the work of removing the books to the new building has been commenced, a work which it is expected will take about three months. Mr. Green, the superintendent, has an ingenious arrangement for removing dust from the books before they are placed upon the new shelves. He has attached an ordinary rubber hose to the air compressor of the pneumatic tube system, and, to use his language, will just "turn the hose" on the dusty books. Instead of water, however, a stream of air, under heavy pressure, will do the work. At the end of the hose is a broad nozzle, 4 in. by 4 in., which will enable the air to play on the books in a stream the shape of a brush. Assistant Librarian Hutchinson says the new library is "the most gorgeous public edifice in America. It has the largest golden dome in the world, with 10,000sq.ft. of surface. It is lighted by 1,800 windows. There are 25,000,000 bricks, and 1,250,000dol. worth of granite. Congress appropriated 6,000,000dol. for its cost. The builder turned over 300,000dol. to the Treasury of this money when he handed over the keys." In the rotunda or reading-room there will be room at the table, allowing 4ft. to each person—for 260 readers at one time, and this is exclusive of the alcoves for students pursuing some special line of research. On the great dais in the centre will stand the librarian and his clerks, taking orders for books and telephoning to the men in the distant book-stacks. From the stacks the books will be sent to the reading-room in travelling trays, like those employed in retail stores for conveying bundles and money. A tunnel 3ft. underground, and containing an endless chain railway, connects the library with the Capitol, so that when a member of either house needs a book, even in the middle of a speech, it can be supplied at a moment's notice. The library of Congress ranks sixth among the libraries of the world in its present contents.

The foundation-stone of a new Roman Catholic orphanage was laid at Sidmouth last week. It is being built from plans by the Rev. Canon Scoles, of Yeovil.

PREMIATED DESIGN FOR HOUSES ON THE BROOM WATER ESTATE TEDDINGTON T. ELSON HARDY ARCHTS.
HAROLD G. COYNE

PREMIATED DESIGN FOR HOUSES AT TEDDINGTON.

THIS design was awarded third premium in a recent open competition for houses on the Broom Water Estate, Teddington. According to instructions, they had not to be more costly, or to cover a greater area, than the smaller houses already built upon the estate. No other materials than those already used upon the estate had to be employed, and the designs had to be of a character suitable to be placed amongst the houses already built. The authors of the design are Messrs. T. Elson Hardy and Harold G. Coyne.

AN HISTORIC VARNISH FACTORY.

THE people of West Ham have a double interest in the firm of Messrs. Robert Ingham Clark and Co., Limited. In the first place, Mr. Robert Ingham Clark, J.P., the managing director, to whom the success of the present business is mainly due, is a gentleman well known in the borough, and is a man of such high character that wherever he is known, there he is honoured and esteemed. Secondly, the firm have a large factory on historic ground at West Ham Abbey, and here they have built up a huge business, with a reputation second to no firm in England. This is equivalent to saying that as manufacturers of japan and varnish they have no superiors in the world, for whatever foreign competitors may have achieved in other departments of trade, it is admitted that in the production of these goods England still stands easily first.

Perhaps the only resemblance modern West Ham Abbey, in its guise as a varnish manufactory, bears to its illustrious predecessor, is in the fact that it is surrounded by a wall of considerable height, and flanked by the Channelsea river—a tidal tributary of the Thames.

Established originally in the year 1846, in the City of London, Messrs. Robert Ingham and Co., about 25 years ago, to meet the requirements of their rapidly-increasing trade, purchased the West Ham Abbey freehold, and arranged and fitted-up these works upon the most advanced scientific principles for the economical production

of this important article of commerce. From time to time additions have been made, and the storage capacity greatly increased. Being by far the largest manufactory in England devoted exclusively to varnish, it may fittingly be taken as generally typical of the industry. Recently, the firm have purchased the freehold of the adjoining Langthorne Chemical Works, bringing the total area at their command to between six and seven acres.

The business has steadily developed until the output at the present time, averaging as it does considerably over a thousand gallons per day, is believed to be the heaviest in the trade. The firm are contractors to Her Majesty's Government, the Admiralty, the Indian Government and State Railways, and other Government departments, as well as many of the largest English and foreign railway and tramway companies; they have agencies and depots in most European countries, the Australian Colonies, New Zealand, Canada, South Africa, India, China, and Japan; and, it may be added, there is scarcely a possible market in the civilised world to which, during the last 30 years, their goods have not been sent. Some idea of the enterprise which characterises Messrs. Ingham Clark and Co.'s operations may be formed by the fact that their representatives have repeatedly made "the round trip" of the globe, visiting the established depots, and organising and developing fresh connections.

The offices of the firm are at 6, St. Helen's-place, E.C.4, and they have also an establishment in Paris. Lately they have combined with their business that of Messrs. Pratt and Lambert, varnish makers, of New York and Chicago. During the past few months, Mr. R. Ingham Clark and other directors of the company have been to the United States to complete the negotiations, and the American house has been reorganised, with a capital of £70,000, in which Messrs. Robert Ingham Clark and Co. (whose capital is £300,000) take the controlling interest. A factory is being equipped at Long Island City for the manufacture of the English brand, and the existing factory in that city is also being enlarged in order to give more storage accommodation. The amalgamation

is largely due to the heavy import duty, which, already 25 per cent. on English manufactured varnish, has been increased a further 10 per cent. under the Dingley tariff, and to the conviction forced upon Mr. Clark that the only way to effectively distribute the celebrated "Britannia" brand of his firm in the United States was to manufacture over there. Messrs. Robt. Ingham Clark and Co.'s goods have such a high reputation on this side of the Atlantic that this will doubtless prove an excellent method of opening up an extensive American business. The varnishes made by the firm in the States will be identical with those manufactured in England, which have hitherto been sold in the States through their agents and representatives.

At their commodious city offices the firm have a collection of fossil resins which is undoubtedly the finest in the world. Displayed in its entirety at the Paris Exhibition of 1878, where the firm obtained a prize medal, it commanded universal admiration, and at the Manchester Jubilee Exhibition, where some of the more striking specimens were shown, it attracted the attention of some of the leading scientists. Messrs. Robt. Ingham Clark and Co. have also gained the silver medal at Sydney, 1880, the award of the First Order of Merit at Adelaide, 1887, and the same distinction at Melbourne, 1888—in each case the highest honour obtainable.

RESTORING CHIMNEYS TO THE PLUMB.

TO whatever cause it may be due, probably in the majority of instances to the unequal settlement of the foundations, the fact incontestably remains that every nine chimney shafts out of ten ultimately develop a tendency to imitate the example set them by the famous campanile of Pisa. Independently of permanent leanings in that direction, every chimney shaft of a height worth mentioning, undergoes temporary terminal deflections during a bit of a breeze. Observations made with standard surveying instruments have recorded swayings to and fro to take place in tall chimneys to a

maximum amount of some 9in. and 10in. Instead of these alternate deflections of the shafts from the perpendicular constituting, as some might imagine, a radical weakness and dangerous source of insecurity, and possibly of the future collapse of the structure, their occurrence is favourable to its stability. In every architectural and engineering structure

FIG. 1.

there must be, under an external force of any description, a certain amount of "yielding." Nature affords the best example: a good stick always bends before it breaks, and trees which, from their especial formation, cannot bend, or refuse to bend before the blast, are simply swept away, literally deracinated. In the BUILDING NEWS of the 2nd of this month we drew attention to the general transportation of buildings of every description in America, in which, it must be

FIG. 2.

conceded, our Transatlantic friends are past-masters. The particular example selected for quotation was that of a chimney shaft. For one of these structures which require to be transferred intact to another site, there are at least some dozen or so which demand, owing to their aberration from the normal, not a change of site, but a rehabilitation of their former perpendicular and graceful contours. We intend now to place before our readers an instance of the manner in which the restoration of a chimney shaft to the

FIG. 3.

plumb has been successfully accomplished by means very different from those usually employed.

As an example, among many others, with which we are acquainted, we select that of a shaft 175ft. in height in the United States, which has been restored to its original position by the ingenious devices which are now before us. In Fig. 1 is represented a plan at the foundation level of the

shaft, and in Fig. 2 is shown the elevation of the basement portion. The necessary dimensions remarked on the drawings, so they need not be recapitulated in the text. The total weight of the chimney was about 280 tons, of which 160 tons may be credited to the foundations. Before proceeding with the actual operations required to effect the desired result, a few particulars respecting the nature of the substratum upon which this shaft was erected will be of interest. The site itself, or rather the underlying soil, is composed for a very great depth of alluvial deposits, intermixed here and there with thin and intermittent layers or veins of sand. At what depth any rock, or even any comparatively solid ground, was to be found is not apparent, since the foundations were "got in" on the unreliable bottom already mentioned. Shortly after erection it was perceived that the shaft commenced to evince signs of leaning in one direction; but for some time nothing was done, although a very careful watch was kept upon the chimney shaft. It was not until the deflection from the plumb attained the dimension of 2ft. 4in. that it became evident that some measures must be adopted to insure, not only the safety of the shaft, but, what is of much greater importance, the limbs and lives of the public. The object to be satisfactorily accomplished was to pull back the chimney to its original position, which was effected in the following manner:—The original or normal position of the chimney shaft is represented in Fig. 3, and the position which it had assumed, when it was considered imperative to adopt some measures to prevent it completely collapsing, is shown by the dotted lines A, B, D, E. Owing to the small scale upon which Fig. 3 is necessarily plotted, the derivation from the perpendicular of the summit of the shaft has been a little exaggerated—that is, in other words, that portion of the illustration has been drawn to a slightly distorted scale. It was some time after the erection of the shaft before the "list" began to be in evidence. It commenced with a deviation from the plumb of 1ft. 3in. before any particular attention was drawn to it, when the deflection was carefully and accurately measured with a view to watch very

FIG. 4.

closely any future movement in the same direction. It is not only tall chimney shafts, but towers, spires, steeples, beacons, and lighthouses which are subjected to the same conditions. As examples, witness the celebrated leaning-tower already mentioned, and the steeple of the parish church of Chesterfield, popularly known as the town of the crooked spire.

When a tall chimney shaft, or any other of the lofty edifices enumerated, commences to "get out of the plumb," as the sensible and practical workman's phrase has it, there are two general ways in which it evinces its failing and calls for help. It may begin by bending increments of individually so small an amount that a long and, perhaps, very regrettable period of time may elapse before any real mischief becomes apparent. On the other hand, it may develop such sudden and serious indications of failure, that, as a precautionary preliminary, a certain length, usually about a third of its total height, is immediately shored up. The means adopted in the present instance will be readily intelligible on a reference to Fig. 4. At a point in the neighbourhood of the centre of gravity of the shaft a strong temporary scaffolding or framework of stout timbering was erected, completely encircling it, and braced and tied together, both transversely and diagonally. Guy ropes, *b b*, attached to the upright barks, *a a a*, maintained the shaft in equilibrium, while its restoration to the normal was in progress. A couple of wire cables, the one *c*, which was 2½in. in diameter, acting as the hauling, and the other *c* as the regulating cable, as

well as two small ropes at right angles to the former, were connected to the framework. The power or motive force was obtained by a suitable arrangement of tackle, pulleys, and other auxiliary machinery and gearing. Before, however, actually commencing the operation of lineal rectification, the earth round one-half of the circumference of the chimney was excavated down to the level of A—E in Fig. 3, so as to prevent it from offering any resistance to the return of the shaft to the perpendicular. As might be expected, the pressure or first haul was made very gently and gradually, and, indeed, the whole work demanded the exercise of considerable skill, caution, and patience. Nearly a month elapsed before any perceptible movement in the direction desired could be measured and recorded. No sooner had the whole *modus operandi* got into full swing than the shaft gave evidence of a visible retrogression towards its original vertical position at the rate of about ¼in. per day. When the operation was successfully terminated there was not the least indication of any crack or fissure in any part of the structure. T. C.

OAK CHAIR FROM THE CLUNY MUSEUM.

THE little Oak Chair now in the Cluny Museum possesses a very curiously-shaped and carved back of free treatment. The circle

near the top contains a lion's mask, and below, the half-circle is pierced through. The columnar legs are characteristic of French work of the 16th and 17th centuries.

MASONRY DAMS.*

A FEW treatises and articles have been published on the construction of dams, but these have generally been devoted to some special kind of construction to some particular profile, or have been descriptive of works executed. Mr. C. F. Courtney, M.Inst.C.E., assistant engineer, Manchester, &c., has brought together in a small volume a good deal of valuable data, and furnishes the engineer with some practical advice. The author has had experience in dealing with large bodies of water for mining works, and has found the need of information in a compact form. In determining pressures, the graphic system is used, and for many reasons it is a preferable method to calculation, as any error can be detected by the polygon of forces which cannot be made to close. The author deals with his subject from the inception to the finish. Many useful suggestions will be found in the remarks on site and position, location of dam, foundations, and construction. The sites most suitable are lagoons or lakes; those which are neither mountainous nor flat, especially those which command extensive

* *Masonry Dams, from Inception to Completion.* By C. F. COURTNEY, M.Inst.C.E. London: Crosby Lockwood and Co.

drainage areas, and which will yield more than the required quantity of water from the average yearly rainfall. Large areas of water are, of course, subject to evaporation, and this element must be considered, so that it does not bear a great disproportion to the amount stored. Mr. Courtney gives some useful approximation for calculating the water obtained from a given area, and a table of the cubic feet of water per acre from various rainfalls is appended. Curved masonry dams are, no doubt, of greater strength than straight dams, as a curved dam convex on the upstream face acts like an arch abutting on the sides of valley. Beyond 600ft. radius, the curved form is considered doubtful. "There is a general consensus of opinion that the same principle should be followed in designing a profile, whatever the plan, unless a curve of less than 300ft. be adopted, as it is found impossible to state definitely when a dam may be considered to act as a horizontal arch, the investigation resting on assumption, and being withal exceedingly complicated." The author gives the report of the board of experts appointed by the Aqueduct Commissioners to the Quaker Bridge dam on the profile. Their conclusions are briefly as follows:—That the curved form in plan is safe to close a deep, narrow gorge if the radius is short, the cross section of dam may be produced below the "gravity section"; that a gravity dam, built in plan on a curve of long radius, derives no appreciable aid from such action so long as the masonry remains intact; but in case of yielding of masonry, that form might prove of advantage; that the curved form better accommodates itself to change of volume due to change in temperature. A profile of the Quaker Bridge dam, designed by the board of experts, is given. The chapter on "Waste Weirs" is important, and the author gives the principles to be followed in fixing the width for the discharge of waste weir. The form of foundation, Mr. Courtney says, is no less important, and a section is shown which may be accepted as a good form to prevent filtration or percolation by means of an apron or valance excavated along the inner toe of the wall, and forming a sort of masonry tenon. Several useful suggestions are made on the construction of dams, which are divided into the following four classes:—(1) Cut-stone masonry, (2) rubble masonry, (3) concrete, (4) rubble or concrete, with cut-stone (ashlar) facings. The advantages of each of these is discussed—cut-stone or block masonry is said to be the best and most solid; rubble is more easily worked, and has great strength, and is adapted to any form of profile; and concrete is said to have all the advantages of rubble masonry and is the most easily worked. The last kind is not recommended, as it is liable to uneven settlement. The author treats on "leakage and sweating" failure of dams, and the appendix contains a good form of specification, estimates of cost, and other useful data.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXVIII.

THE system of splicing, illustrated in one form in Figs. 165-66, in the last article, is frequently adopted as a means of imparting lateral stiffness to braced structures; it is found in the arched spans of many bridges, as well as in roof principals. Fig. 176 also shows a method of splicing in the vertical direction, adopted on one of Sir John Fowler's bridges, built of continuous girders. The girders are 12ft. 7in. deep, and are built of top and bottom members, and diagonal bracing for the web: the top and bottom members, A B, are built of a T-section, with horizontal and vertical plates, united with angles. These are connected and braced by means of diagonal angles C, crossing at 45° on each side of the vertical web-plates of the top and bottom members, and set back to back, and so riveted. At intervals, vertical angles D are spliced and riveted to top and bottom members and to the diagonal angles; at the centre they are secured apart with a covering-plate.

The principle of the American hinged, or pin and link bridges, on which principle most bridges are built in that country, is that of leaving the tension and compression members free to adjust themselves to varying strains, and to apportion to each member its own due share of work; each member is hinged on a pin, the stresses are transmitted through the pins, and the members are not tied rigidly to one another, but are free to

FIG. 176.

move. The tension members are composed of links which are hung on the pins; the compression members are similarly hung, and, as they are not riveted, they are formed of, or reinforced and stiffened with, angles, or channels, or other sections. In this system there is no loss of strength due to reduction of section by rivet holes.

The Clarence Bridge at Cardiff is formed of pin-connected trusses, a method which, though common in America, is little known here. There is so little demand for heavy links for pin bridges

market were sent to New York to be upset, as was done in the case of the Clarence Bridge.

In the American pin bridge it is desirable, in order to insure the necessary accuracy, to bore the holes for the pins in both ends of the bars simultaneously. Machines are specially constructed to facilitate this work; a long bed carries two traverse framings, each having a separate drilling-machine, the distance of the framings being adjustable. The bars are slid under the drills from one side, and taken out at the other.

FIG. 177.

that no plant exists in this country for making them; welding is not permissible, and upsetting requires a special plant. The steel eye-bars forming the diagonal ties in the main girders of the Clarence Bridge at Cardiff were sent to New York to be upset; in this process the heads of the blank bars are rolled of the same width as the bar, but of sufficient thickness to allow of their being heated and spread out laterally into the form of the eye. The bar is rolled in a universal mill, having a lower horizontal roller supported on hydraulic cylinders, to admit of its being raised and lowered during the passage of the bar so as to roll the bar with a thin body and thick ends; these ends are afterwards heated in gas furnaces, and spread out by means of a plunger, and die forged. The tie-bars for the roof of the Cardiff

The American pin bridges are made cheaply; some few details of the methods of union of one of these are shown in Figs. 177, 178, 179. The top chord, A, is built of 15in. channels, connected by a plate on the upper side and by bracing on the lower; the bottom chord is formed wholly of eye-bars, B, Fig. 177, arranged in groups from panel to panel, the numbers and groups increasing towards the centre. The verticals D, Figs. 178 and 179, are built of channels, braced together on both sides. The end-posts C, Fig. 177, are made of channel sections, compounded of plate and angle, being united with a plate on one side and with bracing on the other; these are abutted with a planed joint, and attached to the chords with internal covering-plates. The central posts are simply hinged to the chords, Fig. 178, strengthening

Fig. 178.

plates being riveted to the channels where the pins pass through; the attachments of the hinge-pins at the junction of the end-post and top-chord is shown in Fig. 177. The pin passes through strengthening plates *a*. The pin attachment of the first links of the bottom chord is also seen in Fig. 177, and the abutment of the end-post, and its fastening by angle irons to the wrought-iron plate *b*, which rests on the expansion

centre by channels, *dd*, stiffened with cross-bracing and attached with gussets *e*, the last vertical being connected to the top end-pin, Fig. 177, with tension rods; this arrangement thus halves the length of the posts as columns and reduces their tendency to bending. In many trusses the diagonals are pin-connected to the posts at the centre, so halving their length and stiffening the truss. In Fig. 178 the attachment

The Haarlem River bridge at New York, completed in 1882, is a good example of a pin-connected structure. The details of the joints vary

Fig. 179.

Fig. 180.

from panel to panel, as the forms and dimensions of the members vary. Fig. 180 shows the end joint between top boom A, raking strut B, vertical

Fig. 181.

Fig. 182.

roller. The bars *B* of the lower chord are prevented from sagging by the support rendered by brackets, as seen in Fig. 178, and in some cases on the pin nuts. The diagonals are prevented from sagging and rattling by being made to rest upon cast iron brackets *c* riveted to the verticals, Fig. 179. The verticals are connected at the

of the floor-beams *E* is shown; they are suspended from the lower chord pins by stirrups *e*, bevelled washer-plates taking the nuts. Lateral bolts *f* brace the floor-beams. The same fig. and Fig. 177 show the attachment of the overhead girders by means of riveted plates, and bolts passing through lugs, and also lateral rod braces.

strut *C*, and diagonal ties *D*, and Fig. 181 is the connection at the commencement of the next panel. The top member *A* is formed of two 12in. channels, connected by a top plate covering the two panels next the end; in the two succeeding panels the plate is discontinued and its place taken by lattice bracing, while beyond these the

AN ARM-CHAIR FROM SALAMANCA.

place of the channels and lattice bracing is taken by links, also pin-connected from panel to panel. The raking strut B in Fig. 180 is built up of 12in. channels united with a joint section; the vertical strut C is a joist section stiffened with plates, and the ties D are two flat bars. The bottom boom is built of channels united by lattice bracing, and is pin-connected to the ties. In Fig. 181 the verticals are formed of channels and joists, and the diagonals are round rods with links and screws for adjusting the tension.

In the Clarence Bridge at Cardiff the top boom consists of two 12in. channels spaced 15in. apart, connected with a solid plate on top and with bracing on the bottom; the bottom boom consists of links in groups, pin-connected. The vertical struts are composed of channels connected with

broken, the fracture had to occur in the body of the bar; these tests were to be made at the expense of the contractor, who might dispense with them only on the condition that he increased the section of the bars by 20 per cent., without extra charge. The amount of play allowed between pins and eyes was only $\frac{1}{16}$ th of an inch. J. H.

BOOKS RECEIVED.

The Art of Tracing, by E. W. FRITCHLEY, Architect (Bombay: Education Society Steam Press), is a useful little book for the use of pupils and draughtsmen. Mr. Fritchley's instructions will be found of much value to those who are engaged in tracings of architectural

A TABLE FROM SALAMANCA.

bracing, and the diagonal ties are flat eye-bars, the whole being pin-connected. The centre panel is counterbraced, provided with screw couplings for tightening up. Fig. 182 shows the connection between the bottom boom A, a vertical B, a diagonal C, and a counterbrace D. The bars B were made parallel, because no English firm would undertake to upset them; the ties C were those sent to America.

Since the safety of a bridge depends on the eye-bars the stringency of specifications is necessary. In the Nebraska City bridge, erected two or three years since, it was stipulated that ten full-sized eye-bars should be submitted for test, and, when

work, the essentials of which are accuracy and expression. The author justly observes that drawing and tracing are two distinct things, and that a knowledge of drawing by no means fits a student for tracing with ink. Many useful hints are given about tracing cloth, and how it should be cut to avoid waste, how the surface of tracing cloth should be prepared by rubbing it over with powdered chalk or with indiarubber—the latter plan is preferred. The hints on preparing India ink, re-using dried ink, arrangement of drawing table; the method of grinding the blades of the drawing-pen—a very important thing, method of filling pen, how to hold the pen, will be

found worth the tracer's attention. The chapters on T- and set-squares, "Proportion and Effect," "Colouring Plans and Sections," comprise many useful suggestions. Moist water-colours are recommended, as they are quicker prepared and more uniform when mixed. They do not dry so rapidly as dry colours. The author says: "A little taken from the pan at the end of a pen-knife blade, and washed off into the colour-saucer by means of a camel's-hair brush and water, produces a thorough uniformity in the depth of colour, absolutely necessary in applying flat washes. When several tints of the same colour are to be used in different parts, it is economical to wash off the colour from the pen-knife blade with as little water as possible, and to apply the dark tints first, then to add water for the lighter tints." One useful caution is to avoid putting a wetted brush into a moist water-colour pan, as the slightest dampness in the weather would then soon spoil the colour. Again, we read, on applying tints, that they should be put on with a quick hand over the whole area; otherwise streaks and patches of different depths of colour will occur. The author does not say how a thin white edge is to be left between the coloured parts of sections and plans and the inclosing lines. No doubt a finished and neat effect is thereby given; but draughtsmen have seldom the time to observe these finishes in colouring plans. The architect's methods of colouring tracings are rather less methodical and exact than those described, but the suggestions are of value.

—*Illustrated Europe*, No. 173: *Solothurn and Baselland*. The latest volume of this excellent series of sixpenny paper-covered guides to the Continent (published by the Art Institute of Orell Füssli at Zurich) deals with the scenery of the cantons of Solothurn and Jura. Although tamer and less romantic in character than the Alpine districts within sight to the south-east, contain, nevertheless, some beautiful tracts of forest-clad ridges and wide pastures interspersed with quaint villages and old-world towns. The book is brightly penned by E. Zingg and W. von Ar, and contains a key map and fifteen illustrations, by J. Weber, of the Clock House and other features of Solothurn and of hamlets among the Juras.

ARM-CHAIR FROM SALAMANCA.

THIS Chair, of ample proportions, is typical of Spanish work in the 17th century, with the florid scrollwork to top of back and underseat. The arms are broad and boldly curved. There is no front rail, but the two side ones are elaborately shaped.

A TABLE FROM SALAMANCA.

THE Table, with sloping baluster legs, is very quaint, and the scroll ironwork, which forms a tie to the two ends, whether part of the original work or not, is a curious mode of supplying the need of a stretching rail.

CHIPS.

The work of repairing the tower and spire of Salisbury Cathedral is being rapidly pushed forward, and Sir A. W. Blomfield, A.R.A., the architect, believes that by the new year the scaffolding will have been removed. He has informed the Dean and Chapter that the north-west turret is in such a bad state that it will be necessary to have it rebuilt.

Extensive alterations are to be made during the next few months in the Admiralty House at Portsmouth, and, until they are completed, Sir Michael and Lady Culme-Seymour will reside at Alderstokey. About £4,000 is to be spent.

The watching committee of Aberdeen Town Council have approved the plans for the new fire-brigade station in King-street. The buildings are estimated to cost £11,896.

At the parish church of St. Chad's, Over, near Northwich, the foundation-stone was laid on Friday of two new vestries and an organ transept, which are being built at a cost of nearly £1,000. This is the first time since the year 1643 that the fabric of this ancient church, which dates from the reign of Edward I., has been substantially enlarged. For more than 350 years its walls have stood very much as they are to-day.

At a special meeting of the Parks and Galleries Committee of Glasgow Corporation, last week, it was decided to acquire 43½ acres of ground on the south side of the Clyde, between the river and Rutherglen-road, opposite Glasgow Green, as an extension to the green, at a cost of £1,000.

LICENSING OF ARCHITECTS.

LETTERS addressed to the secretaries of the various Chapters of the American Institute of Architects are being sent out by that Institute in the following form:—

"At the National Convention of the American Institute of Architects held last October, the following resolution was passed:—

"Resolved: That a committee of three be appointed by the President to obtain expressions of opinions from the Chapters as to the advisability of the licensing of architects by State legislation and the relation which the examination for such license should sustain to that required for examination for admission to membership in the Institute, and, further, if they deem it expedient that the election of Fellows be made more dependent upon professional skill and practice than at present. This report to be made to the next convention.

"The committee are soliciting expressions of opinion and recommendation upon the points covered in the inquiry of the resolution, so that they may be able to make a thorough report to the next annual convention, which is to be held in Detroit in October next. If you can have resolutions drafted and passed by your society which will express the sentiment of your Society or Chapter upon these points and forward the same to the chairman of this committee, you will be conferring a favour upon the chairman as well as putting the American Institute of Architects in possession of valuable data for future action. If the time is not sufficient to get the expressions from your Society or Chapter upon these points before the first of October, will you please bring the matter before the managers, executive board, or committees of your Chapters or Societies, and prominent members of the profession in the locality covered by your Society and forward to the Chairman of this Committee? All data and information and expressions of individual opinion that you may be able to secure, will be appreciated. Please send same before the first of October, so that the Committee may have time to formulate its report for the next convention."

CHIPS.

At Conway on Tuesday the memorial-stone was laid of the new schools for girls in course of erection. The architects are Messrs. Grace and Ould, Liverpool, and the contractors Messrs. Parry and Sons, Llandudno.

A brass Communion-rail has been made for Clonfert Cathedral by Messrs. J. and C. McGloughlin, of Dublin, in accordance with the design of Mr. J. F. Fuller, F.S.A., the architect under whose supervision the work of restoration of this cathedral is being carried out.

The reredos at All Saints', Wigan, has been improved and adorned as a memorial of Canon the Hon. G. T. O. Bridgeman, for many years rector of Wigan. The reredos has been altered and decorated by Messrs. James Powell and Son.

A window has just been dedicated, in the church of St. Martin's, North Nibley, to the memory of Henry Williams, son of the commentator, and formerly vicar of the parish. The design is in the 15th-century style, containing in three lights the subjects of the Annunciation, Visitation, and Purification. The artist is Mr. Percy Bacon, of New-man-street.

The town council of Launceston met on Wednesday evening to receive Mr. Trevail's plans for the public library to be erected by Mr. Passmore Edwards. Mr. Trevail stated that the site in Church-street conditionally selected by the council was a very unsatisfactory one, being much too small. However, in deference to the wishes of the council, he had done his best with the space at his disposal; but the rooms designed were very cramped. He did not approve of the site, and it now rested with the council to say if the building as designed would meet the wants of the town. It was decided to hold a special committee meeting forthwith, to consider Mr. Trevail's plans, and to decide whether the Church-street site shall be purchased.

During the past week a stained-glass window has been put in the apse of the northern aisle of the Abbey Church at Romsey, at the north-east corner of the Abbey. The subject depicted is that of St. George and the Dragon.

The Secretary of State for India has appointed Mr. Edmund Neel, C.I.E., to be Secretary of the Public Works Department at the India Office, in succession to Mr. Clement S. Colvin, C.S.I., who has retired. The salary of the appointment is £1,200 a year.

OBITUARY.

WE regret to announce the death of our old contributor and correspondent Mr. PHILIP EDWARD MASEY, architect, late of Old Bond-street, W., and Mornington-road, N.W. Mr. Masey, who died on Wednesday week at Hope Villa, Harold-street, Camberwell, was in his 74th year. He was for many years partner with Mr. John Norton, F.R.I.B.A.

THE death is announced of Alderman JOHN PARKER, of Rochdale. Mr. Parker, who was in his 82nd year, was by some years the oldest man in the corporation, in the work of which he had for nearly twenty-one years taken an active part. When, in January, 1896, he completed his 80th year, his workpeople presented him with an illuminated address testifying to the happy relationships which had always existed between him and them. Some of those who signed the address had been employed by him for close upon thirty years. The deceased alderman went from Burnley to Rochdale when he was sixteen years of age to be apprenticed at the machine works of his uncle, Mr. Thomas Robinson. He subsequently, with a Mr. Gibson, started in business as a timber merchant in River-street. The partnership was after a time dissolved, and over thirty years ago Mr. Parker established the business of builder and timber merchant in Molesworth-street, Rochdale, of which he remained the head up to the time of his decease. From 1873 until 1889 he was a member of the board of guardians. Mr. Parker was a member of the buildings, baths, parks, and cemetery and gas committees of the corporation. Mr. Parker married the eldest sister of Edwin Waugh; there were two children of the marriage—a son, who died over twenty years ago, and a daughter, who married Mr. Abraham Tweedale (for many years associated with Alderman Parker in the management of his business), and still survives. Mrs. Parker died many years ago.

THE death is announced, at the age of 78, of Mr. WILLIAM SUTHERLAND, one of the founders of the *Journal of Decorative Arts*, after a long illness. Mr. Sutherland was born in Manchester, his parents being natives of Dornoch, and he was apprenticed to a house-painter, in whose employ he acquired a knowledge of methods which were to serve him in good stead in after years. To a knowledge of graining and marbling he added that of drawing and colour, and associated himself with a small coterie of young men, who met at regular intervals for the study of painting, portraiture being the principal object of their efforts. Mr. Sutherland afterwards went first to Hull and thence to London, where he stayed for a few years, working in some of the leading shops. Between 1847 and 1859 he was in business in Birmingham on his own account. In 1848 he published a small brochure on graining, which, for its time, had a large sale, and two years later Mr. Sutherland wrote a work on sign-writing, issued at the price of one guinea. The great cost of producing the coloured plates, however, and a not too keen capacity for making a bargain, left the author with "his trouble for his pains." For four years he was in business in Rochdale, and in 1863 he left there to return to his native town, where he resided ever since. At Manchester he commenced business as a decorator and grainer to the trade. In 1865 he inaugurated a movement for holding an art workman's exhibition on the lines of the more modern Arts and Crafts. This was held in the then Royal Institution, now the Art Gallery, in Mosley-street, and was in every way a success. Mr. Sutherland was chairman of the committee which carried it through, and not only was an excellent exhibition got together from all parts of Lancashire, but a strong impulse was given to the decorative arts of all kinds, particularly as related to house-painting. In 1866 a second exhibition on the same lines was held in the same place, directed by an enlarged committee. For the first of these exhibitions Mr. Sutherland painted five large panels, to which a critic writing in the *BUILDING NEWS* referred in the following terms:—"The defects and limitations of Mr. Sutherland's art are those which a definite and thorough training in early life would have obviated. He has great natural talent and grasp of form and colour, which, directed and concentrated into more specific channels, could not have failed to have led to great distinction." In 1863 he published, through Abel Heywood and Son, of Manchester, a "Handbook of Graining and Sign-writing," and a few years later he was invited by Mr. J.

Passmore Edwards to write some articles for the *BUILDING NEWS* on house-painting and decorating. This he did over the *nom de plume* of "An Experienced Workman." The articles ran for something like three years, and, as a writer in the *Journal of Decorative Arts* says, it is no exaggeration to say that, as a technical exposition of the processes involved in the painting and decorating trades, they have never been equalled. They embodied the result of a life-long experience, set out in precise and lucid style. The greatest tribute to their worth is to be found in the fact that they have been the treasure-trove for every plagiarist and scribbler on painting processes ever since. These articles were, indirectly, the cause of the *Journal of Decorative Arts* being launched on to the public. In 1880 an oil and colour journal, emanating from Leeds, but now defunct, was coolly appropriating them, and issuing them as original contributions. A London contemporary of even larger pretensions was doing likewise, but third-hand, through an American source. Steps were taken to terminate this, and a family conclave was held, at which it was decided to venture into the region of journalism. A nervous affection in 1873, and a weak heart, compelled Mr. Sutherland to withdraw from participation in outside engagements, and for the last 20 years he has been more or less of an invalid, his journalistic work in the early eighties being the extent of his labours. Old age and increasing infirmities, consequent on his persistent remaining indoors, sapped a magnificent constitution, and brought about the end.

MR. ROBERT CARTER, of 88, East-street, Bury, Lancs, died on Thursday evening in last week in his 78th year, from heart disease. He was apprenticed, at the age of 14, with Messrs. James and John Hall, builder, Moorside, Bury. Subsequently he acted as foreman in connection with the erection of several important public buildings in the town, and had charge of constructing Lord Derby's Works at Redvales, from plans drawn by the late Mr. Green, architect, of Portsmouth. For some years he was clerk of the works to Messrs. Maxwell and Tuke, architects, of Manchester, and he also saw several years' service with Messrs. Blackwell and Booth (Mr. Lawrence Booth, formerly of Bury), architects, Manchester. In 1872 he was appointed clerk of the works for the Lancashire and Yorkshire Railway Company, his labours being for the most part in connection with the construction of station and warehouse buildings, a position from which he retired in 1892. He was appointed in 1871 as referee to the Executive Council of the Amalgamated Society of Joiners, an appointment he retained up to the time of his death. For some years he was a prominent member of the Bury Branch of that society, and in 1872, on retiring from the secretaryship of the local branch, he was presented with a valuable timepiece in appreciation of his services. He had an unbroken membership in the lodge of the Manchester Unity of Oddfellows extending over 57 years. For many years he performed the secretarial duties of the lodge, and when he retired from the post about ten years ago he was presented with an illuminated address.

Walter Frost, aged 49, was accidentally injured whilst carrying building materials in Bury St. Edmund's a fortnight ago. Tetanus set in, and he died on Wednesday.

The restoration of the exterior of King's Cliffe parish church is in progress, at a cost of about £500. The windows and masonry are in an insecure condition, and the porches are giving way. Mr. Roberts, of Stamford, is the builder.

On Friday, a meeting of the committee of the Wolverhampton Board of Guardians was held to consider the question of selecting a site for the proposed new workhouse. Several offers were considered, and eventually it was resolved to recommend the board to accept the offer of the New Cross estate, between Heath Town and Wednesfield, for the sum of £11,000. The estate is about 50 acres in extent, and has already met with the approval of an inspector of the Local Government Board.

Mr. H. H. Law, one of the Local Government Board inspectors, held an inquiry at Crigglestone on Friday, with reference to an application by the Wakefield Rural District Council for sanction to borrow £1,000 to extend the waterworks in the straggling township of Crigglestone. Mr. Frank Massie, the engineer to the council, explained that the loan was required in order to provide water for a number of houses in the higher levels in the township.

COMPETITIONS.

COLCHESTER.—The town council resolved in March last to invite six selected architects to send in competitive plans for a new town hall, and offered premiums of £100, £75, and £50 for the designs placed first, second, and third. Mr. Norman Shaw, R.A., has acted as assessor, and has awarded the premiums as follows:—1st, Mr. John Belcher, F.R.I.B.A., of Hanover-square, London; 2nd, Messrs. Baker, May, and Rickards, of Colchester, Clacton-on-Sea, and London; 3rd, Mr. E. W. Mountford, F.R.I.B.A., of Buckingham-street, London. The estimated cost in each case is below £35,000; this estimate being inclusive, in every instance, of the tower. The designs are now on view in the existing town hall. Mr. Belcher's design is Renaissance in style, and three stories in height. On the first floor are the council-chamber, 38ft. by 33ft., and committee-rooms, and over these is the assembly-hall, 84ft. by 33ft.

HIPPERHOLME.—Plans were recently invited by the urban district council for new offices to be built on a site in the Leeds and Whitehall-road. From among ten sets sent in those submitted by Mr. J. F. Walsh, of Halifax, have been selected. The chief room is the council chamber, on the first floor, which is 35ft. by 20ft., and has a panelled ceiling. The facing materials are local wall stones, with ashlar dressings and panels of terracotta. The estimated outlay is £2,000.

HUDDESFIELD.—The scheme for the erection of a tower on Castle Hill to commemorate the reign of the Queen has progressed so far that no less than thirty designs have been received from various parts of the country, as well as three marked "not for competition." The designs are exhibited for inspection by the subscribers to the scheme in the rooms in Byram-street, where the proposed free library and art gallery are expected to be housed, until the end of the present week. Almost every conceivable style of treatment is presented, says a local journal, and in some cases the artists have evidently not had a very adequate idea as to the nature of the situation which the memorial is to occupy, and have indulged in too great elaboration of detail. Those approximating to the keep of a feudal castle seem so far to have met with most favour, although there are several variations upon this idea. In every case almost, the stairs leading to the summit are provided inside the tower, although in one instance, which follows the lighthouse plan, there are winding stairs both internally and externally. The cost of the building suggested to the competitors was £1,500, and most of them have kept this estimate in view, although on some hands it is anticipated that the carrying out of the scheme will involve a larger expenditure. In each instance, the designs provide for the inclusion of a caretaker's dwelling and ticket-office.

LLANDUDNO.—The urban district council of Llandudno received at their last meeting a statement dealing with the proposed municipal buildings, and recommending alterations, representing a deduction from the total cost of £2,175 1s. Messrs. Silcock and Reay, the architects whose design was selected in the recent competition, had written that it was quite impossible to effect anything like a reduction of £2,000, while retaining the original design, and at the same time substituting Portland stone dressings for Bath stone, and asking the committee to again consider the point before incurring further expense in the preparation of new plans and quantities. They suggested that, having failed to accept the original estimate, the interests of the council would now be best served by adopting the last-amended scheme, with the addition of the lavatory accommodation and caretaker's rooms, and they suggested that the business, which had now been under the consideration of the council for over three years, would be greatly facilitated if the architects were consulted, and afforded opportunities of explaining their intentions in the usual way. They asked for the payment of £714 9s. 5d., the balance of their account of £964 9s. 5d. for professional services. Two members, with the clerk, were deputed to consult the solicitor in the matter, and obtain his opinion as to the liability of the council to pay the amount claimed in respect of the new scheme.

NEWCASTLE-ON-TYNE ROYAL INFIRMARY.—The conditions of competition and instructions to architects have just been issued by the building committee for the reconstruction of the infirmary.

The competition is limited to 13 architects, who are requested to send in designs for an infirmary containing 400 beds. It may be necessary to retain for the present the Dobson wing, containing about 146 beds; but the plans must provide for the eventual removal of this wing and its replacement by equivalent accommodation corresponding with the rest of the hospital, and must show how it is to be utilised in the mean time, so far as its ward arrangements are concerned. It will be necessary to construct the new building step by step, and so as at all times if possible to maintain during the construction not less than the present number of 270 patients' beds, and accommodation for the working staff at present residing in the hospital. The architect will therefore be required to show the order in which he proposes to erect the various parts, and also to show to what purpose those parts can be temporarily applied so as to meet the requirements of the hospital during the reconstruction, as well as the purpose for which they are finally intended. The accommodation for nurses, though it may be necessary to place it under the same roof as the rest of the building, must be separated from the working part of the hospital. The principal large wards must be built upon the pavilion system, each bed having a window on either hand. The dimensions of the wards and rooms are for the most part left to the competing architects, and they are requested in their plans to make such provision as is now thought necessary for a large general hospital attached to a medical school. The conditions stipulate that each competitor must furnish, together with his plans, a report describing the buildings proposed to be erected, and must also state the cubical contents of the whole of the erection, including the concrete foundations; must state the materials proposed to be used, and the area to be covered by the buildings. The sum at the disposal of the committee for the new building, exclusive of that part which shall eventually be substituted for the west wing, is £100,000. An estimate must be given of the price per cubic foot at which the designer estimates his building and the entire cost so arrived at. To the author of the selected design will be awarded the work of carrying his design into execution at the usual commission of 5 per cent. The Committee reserve the right to reject the whole or any of the designs should the said designs, in the opinion of the committee and their assessor, be considered unsuitable, and they also reserve the right to call upon the architect whose design is selected to make such modifications or alterations in his plans as they may deem desirable before tenders are invited for carrying out the works. To the authors of the three designs which, in the opinion of the committee and assessor, are next in order of merit to the one selected, will be awarded the respective premiums of £150, £100, and £50. The committee reserve to themselves the right to adopt any feature from any of the premiated designs. It is provided that in the event of any dispute arising between the committee and any architect employed in the work, such dispute shall be referred to Mr. A. Waterhouse, whose decision shall be final and binding on both parties. No perspective drawing will be received, nor any framed or glazed design. All the drawings must be prepared by the competitors themselves, or by their ordinary office staff, and each competitor must make a declaration in writing to that effect. Each set of drawings must be sent in anonymously, but accompanied by a sealed envelope containing the author's name and address and the declaration already referred to above. When each case is unpacked, it and its contents will be marked by the committee for identification; but no distinguishing mark, motto, or device is to be put on the drawings, description, statement, envelope, or case by the competing architects or their agents. The designs will be submitted to Mr. Alfred Waterhouse, R.A., who will advise the committee in their selection. All designs received in conformity with the conditions and instructions will be publicly exhibited after the award is made, and designs must be sent in on or before Tuesday, the 1st day of March, 1898.

WOLVERHAMPTON.—The committee who have charge of the new free library scheme have invited a number of architects of the town to send in competitive designs for the new building on the site of the Old Theatre Royal, Cleveland-road, at an estimated cost of £10,000. They offer premiums of £100 and £50 respectively for the designs placed first and second.

SCHOOLS OF ART.

GLASGOW.—Mr. E. R. Cattens, the secretary of the Glasgow School of Art, has just prepared a comparative table showing the medals awarded in National Competition to the eight principal schools of art of the United Kingdom:—

	Gold Medals.	Silver Medals.	Bronze Medals.	Total Medals.	Total N.C. Prizes.
Glasgow	3	8	23	34	57
Birmingham ..	3	3	17	23	56
Nottingham ..	1	2	6	9	23
* S. Kensington ..	1	1	6	8	23
Sheffield	—	4	3	7	12
Manchester	—	8	13	16	36
Edinburgh	—	—	3	3	6
Liverpool	—	—	—	—	2

* Exclusive of honorary awards to students of the training class.

He also states that whereas the Glasgow School of Art, of which Mr. F. H. Newbery is the head master, gained 3 gold, 8 silver, and 23 bronze, total, 34 medals, the other schools of art and art classes in Scotland, taken together, only received 2 silver and 11 bronze, or in all 13 medals.

CHIPS.

The Roman Catholic church of the Immaculate Conception at Newtownbutler was on Sunday week solemnly opened, after undergoing thorough renovation.

At the last meeting of the Mersey Dock Board, it was resolved to spend £86,700 in deepening and improving the north docks, in accordance with the scheme which has been in operation some years.

The nave of the parish church of Stratford-on-Avon is about to be re-seated from designs by Mr. G. F. Bodley, A.R.A. At the same time the organ will be remodelled.

New carved choir-stalls of oak have just been placed in St. John's Church, Horningblow, and were dedicated on Thursday in last week. They have been executed by Messrs. Jones and Willis, of London and Birmingham.

The foundation-stone of the hall and institute which are being built by public subscription at Fordham to commemorate the 60th anniversary of the reign of Her Majesty Queen Victoria, was laid on Thursday afternoon in last week by Mr. Alexander Peckover, Lord Lieutenant of Cambs. The building, which is being erected by Mr. H. Boon, of Fordham, from designs by Messrs. Gordon Lowther and Gunton, of Finsbury House, Blomfield-street, London, E.C., will contain a hall 56ft. by 28ft., a reading-room, and a room for games, each 18ft. by 14ft. 6in., and rooms for the caretaker. The site is in the chief street of the village.

Mr. R. D. Oldham, officiating director of the Geological Survey of India, is to be deputed for a short time to Ceylon to advise the Ceylon Government regarding the geological survey of the island.

Mr. Mark H. Judge, hon. sec. of the Sunday Society, writes under Sunday's date:—"To-day has been the first Sunday at the National Gallery of British Art. As a branch of the National Gallery it was open to-day as a matter of course. The official returns of the visitors to the national institutions to-day are as follows:—National Gallery of British Art, 3,643; National Gallery, 1,899; British Museum, 1,127; Natural History Museum, 1,345; South Kensington Museum, 2,106; Bethnal Green Museum, 1,389; National Portrait Gallery, exceeding 600; total, 12,109."

A memorial, subscribed for by a number of old Etonians, has just been erected in the ante-chapel of the college, in remembrance of the Rev. John Wilder, late Vice-Provost of Eton, who was connected with the college for more than 80 years. The memorial consists of a tablet of white marble, designed by Mr. Kemp, and executed by Messrs. Farmer and Brindley.

New offices are about to be erected for the newly-formed urban district council at Highbridge, Somerset. Mr. Charles S. Leach, of Victoria-street, Burnham, Highbridge, and Weston-super-Mare, is the architect.

At a meeting of the Art Gallery Committee, held at the Guildhall, Bath, on Friday, it was decided to advertise for tenders for the art gallery, which is to be erected as a permanent memorial of the Queen's record reign. The Duke of Cambridge has promised to lay the foundation-stone of the new building—which will be practically a continuation of the present buildings—on October 18.

The Colonial Office have appointed Mr. T. P. H. King, of the borough engineer's office, Bury, Lancashire, to be State architectural assistant to the Government in Selangor, Straits Settlement. The appointment carries with it an official residence. Twelve months ago Mr. F. Cartwright, son of the Bury borough engineer, was appointed Government engineer at Cyprus.

Building Intelligence.

BRISTOL.—A group of buildings erected for the Bristol Corporation is rapidly approaching completion at the Novers, for the accommodation of infectious cases. The administration block is a building consisting in the main of brick and freestone, the upper portion being of half-timber work. There are an entrance hall, matron's room, nurses' dining-room, accommodation for the resident medical officer, visitors' waiting-room, kitchen, &c., all on the ground floor. The first floor is devoted to bedrooms and bathrooms. The laundry adjoins, and stables and shelter for the ambulance are also provided. There is accommodation at the hospital for 70 patients, and, in addition, eight beds are reserved for the purposes of isolation.

CARISBROOKE CASTLE.—As a memorial to the late Governor of the Isle of Wight, Prince Henry of Battenberg, Carisbrooke Castle has undergone partial restoration from a fund raised by public subscription. Most of the building is still a block of roofless ruins. The gate-house has now been roofed in, and all the rooms of that portion of the castle newly floored. These are the guard-room, the portcullis chamber with the room above, three rooms in the north-west turret, and the spiral staircase in the south-west turret. No alterations have been made externally to the building, and the original gates, built in 1553, are still subsisting. It is proposed to utilise the rooms newly roofed and renovated as a museum for storing ancient manuscripts and antiquities connected with the Castle and the Isle of Wight. Excavations have recently been made at the top of the ancient keep, and hammer-heads and pike-heads, with remnants of domestic utensils, have been found there.

CARNFORTH.—A new Congregational church was opened at Carnforth on Wednesday. The building has been erected from designs prepared by the late Mr. E. Howard Dawson, A.R.I.B.A., of Lancaster (who died suddenly in Manchester last January). It is in the Late Gothic style, the dimensions being, length 62ft., extreme width 60ft. 9in., divided up into nave and side transepts, and will accommodate 500 people. The cost, including concrete construction, has been about £2,000. The building externally is of broken coursed shoddies from the Backsbottom (Wray) quarries, with dressings and bands of red freestone from Barrow. The fittings are all pitch-pine, the walls of rostrum end being panelled and ceiling enriched in keeping with the rest of building, and suitably decorated. A handsome pulpit of Jacobean design has been presented to the church in memory of the late architect, by his father, Mr. E. B. Dawson, LL.B., J.P. The completion of the work was intrusted to Mr. C. J. Ashworth, architect and surveyor, of Lancaster. Mr. R. Hall, of Forton, did the masons' and carpenters' and joiners' work; Mr. R. Hall, of Lancaster, the slating and plastering, and Mr. J. R. Tanner, of Kendal, the plumbing, painting, and glazing.

CAMUS.—Sunday in last week marked the disappearance of the last of the old thatched Catholic churches in Ireland, when a new church was solemnly dedicated to religion at Camus, in the parish of Rasmus. The poorest house in Connemara could compare favourably, says the *Tablet*, with the old chapel at Camus—a relic of the penal times—in size and architectural form. Its ground measurement was 20ft. by 10ft.; its sides were dry walls—stonework put together without mortar; its roof consisted of rafters of rough bog deal, supporting mountain sod, or "scraw," over which was thrown some mountain sedge as thatch. Two little windows, one in the eastern gable and the other in a side wall, admitted a feeble light. An altar stone laid across an old deal box constituted the altar. The floor was of earth, which was uneven and torn up, due to the building being flooded in winter. The style of the new church is Early English; it is lighted by six pointed windows at either side, and three grouped lights on both the eastern and the western gables. The length of the church is 95ft., width 28ft., and the height to the ridge of the roof 35ft. The roof is of pitch pine; that over the chancel is sheathed with stained work, while over the rest of the building the rafters are still exposed. The walls are wainscoted; the three windows over the altar are filled with stained glass; the floor of the chancel is laid in wood; the body of the

church is floored in concrete. The dedication ceremony was performed by the Most Rev. Dr. MacCormack, Bishop of Galway.

EDINBURGH.—Some extensive and important works are now in progress at Edinburgh Castle, in connection with the erection of a new military hospital, for which a grant of £18,000 was recently voted by Parliament. The site of the operations is at the north-west corner of the ground towards Princes-street and Castle-terrace. The new buildings will be treated in the Scottish style, and will occupy the place of the stores and magazine which formerly occupied this site. The building, it is expected, will be ready for occupation within one year. The north block will be occupied solely by wards, while the south block will be occupied by doctors' and attendants' rooms, stores, &c. The whole of the sanitary fittings will be placed in specially-constructed annexes. The kitchen apartments will be situated in a detached block connected to the main buildings by a covered glass corridor. The contract for the whole work has been intrusted to Mr. Colin Macandrew, Lauriston-gardens. Good progress has already been made with the preparatory works.

LEEDS.—The London Clothworkers' Company, who founded and maintain the Textile Industries and Dyeing Departments of the Yorkshire College, last year granted £10,000 for extensions in these departments, and when it became known that additional land would be required for the proposed buildings connected with the textile section they increased their contribution to £15,000. Negotiations were then opened with the owners of the adjoining house property for its purchase, and possession having now been obtained by the College authorities, the work of demolition has commenced. Plans of the new buildings have been prepared by Messrs. Alfred Waterhouse, R.A., and Sons, of London. In the Textile Department room will be provided for a complete plant of scouring, carding, combing, and spinning machinery for both woollen and worsted yarns, and there will also be rooms for conditioning purposes and for warping, beaming, and sizing machinery. The main feature of the Dyeing Department extension will be a splendidly-appointed laboratory for the pursuit of original research work.

NOTTINGHAM.—The Theatre Royal, which was erected in 1865, and which has for the past few months been undergoing extensive alterations, will be reopened on Monday. The entire interior of the building has been reconstructed. The pit floor has been lowered about 2ft., as also has the stage, which has been given an increased dip from the back to the front. This alteration has necessitated the shortening of all the timber supports, and the cellars underneath have had to be lowered accordingly. The stage is about 64ft. wide and 50ft. in depth. A new orchestra, part of which is concealed under the stage, has been built. The upper circle is reached by a new staircase, and, emerging into the crush-room is another fresh staircase. The staircase leading to the gallery is built outside the building, and is connected by a sloping corridor. The old gallery, which accommodated 800, and the upper circle and dress-circle, each capable of seating about 300, have been removed, and new ones of more modern construction have taken their places. The dress-circle saloon is entered by a new entrance. New ladies' cloak-rooms and lavatories have been erected in close proximity to both the dress-circle, upper circle, and gallery, the latter having been provided with a saloon on a large scale. The corridors formerly in use in the dress-circle, upper circle, and gallery have disappeared, and the space thereby gained has been added to the auditorium. All the boxes have been removed, and new ones fixed in their places. The whole of the dressing-rooms have been cut off, and a new block has been built at the rear of the stage, besides new carpenters' shops. The decorations are in fibrous plaster, and of the period of Louis XIV. The theatre, which will accommodate about 3,000, is lighted by electricity. Mr. Henry Vickers, of Nottingham, is the contractor, Mr. F. Matcham the architect, and Mr. Charles Greenman the clerk of the works.

The Old White Horse in Fetter-lane, E.C., one of the last of the numerous coaching inns in the neighbourhood of Holborn, is at the present time being demolished. It had of late been used as a cheap lodging-house.

Engineering Notes.

AVONMOUTH AND SEVERN TUNNEL RAILWAY.—Good progress is being made with the new line of railway to connect the Severn Tunnel with Avonmouth Dock, and the completion of the undertaking is expected to give a fresh impetus to the trade at Avonmouth, inasmuch as vessels will be enabled to ship coal at the dock, instead of proceeding for that purpose to the Welsh ports. The contract for the railway was let to Mr. F. C. Caffin, of Pilning, who made a start with the work last winter, and the line is expected to be completed about this time next year. It will be six miles in length, and, starting from Avonmouth Dock, it proceeds along the flat land facing the Severn Estuary, rising by means of an embankment so as to cross the top of the Severn Tunnel, afterwards joining the old South Wales Railway to New Passage, and forming by means of that railway a junction with the main line at Pilning. At present work is being mainly carried on at the Pilning end, and the material used for making the embankment is obtained from the surplusage from the Severn Tunnel excavations. There are a few engineering difficulties to be encountered, but a good many bridges have to be constructed—viz., five across pills (streamlets), nine under the railway for the accommodation of farmers, and two over the railway. Mr. W. A. Cashman, of Cardiff, is the engineer representing the Great Western Railway Company.

HIGHGATE.—Highgate Archway will shortly be replaced by a single-span iron structure, designed by Sir A. R. Binnie, the engineer of the London County Council. The present archway is about 36ft. high and half as much in width, and is formed of stone, flanked with brickwork, and surmounted by three semi-arches, carrying a bridge wide enough for two carriages. For the new scheme, the tender of Mr. C. Wall, of Chelsea, for £25,126, has been accepted, and a period of 2½ years has been allowed for the execution of the contract.

THE HUDSON RIVER TUNNEL.—The *Scientific American* states that there is prospect of the early completion of the tunnel under the Hudson River, which was begun in the year 1874, and upon which work was suspended in 1892, when about four-fifths of the work had been completed. It is stated by the legal representative of the English bondholders that steps are to be taken to foreclose the mortgage of 2,750,000dol., reorganise the company, issue new bonds, and push the work to completion. The tunnel starts from a shaft on the New Jersey side of the river, which is located at Fifteenth-street, Jersey City, and it is to terminate in a shaft on the New York side at the foot of Morton-street. The total distance will be 5,400ft., and of this about four-fifths have been completed. It was originally intended that the terminus on the New York side should be at Washington-square; but, under the new scheme, it is probable that it will be placed nearer Broadway. The cost of the undertaking has reached about 4,000,000dol., and it is estimated that the tunnel can be completed by 1,000,000dol. more. It is likely that the engineers (*sic*—*Qy.* contractors) who have just brought to a satisfactory completion the great Blackwall Tunnel, London, will have charge of the tunnel under the Hudson, and the fact that they overcame the many serious obstacles encountered in the prosecution of that work is a guarantee that the Hudson River scheme will this time be carried to a successful termination. One of the chief causes of the abandonment was the difficulty experienced in carrying the tunnel through the bed of the river at the point where the overlying material was extremely shallow. A similar difficulty was met in the Blackwall tunnel, but it was overcome by dumping material from barges and forming a false bed to the river. The unfinished tunnel is at present flooded with water, which, it is estimated, can be pumped in about two weeks' time, and if the work is pushed through with vigour, it will probably take about nine or ten months to complete the whole work.

The foundation-stone of a new children's hospital was laid at Lowestoft on Tuesday week. The building is to be connected with the existing hospital by a covered corridor. It will consist of one ward with six beds. The entire cost is defrayed by Mr. W. Youngman in commemoration of the Queen's Great Jubilee.

MANSION HOUSE, DUMFRIESSHIRE.—GROVE FEVER HOSPITAL,
TOOTING GRAVENEY.—BEDFORD COURT MANSIONS.—
"DAILY EXPRESS" OFFICE, PAISLEY.—DETAIL OF THE
ATRIUM, PALAZZO MASSIMI, ROME.

MANSION HOUSE, DUMFRIES; HIRE.

I HAVE nothing to say about Dalskaith House except that it is the new house designed by me for Mr. W. A. Coats to take the place of the present house, which lies low; therefore the site has been changed.

JOHN A. CAMPBELL.

THE GROVE FEVER HOSPITAL, TOOTING GRAVENEY.

This is the last of the series of three very large new fever hospitals which have been in course of erection during the last three or four years under the authority of the Metropolitan Asylums Board. The present hospital occupies a site some twenty-seven acres in extent, and the plans for the buildings, prepared by Mr. A. Hessel Tiltman, F.R.I.B.A., were selected in open competition by Mr. Alfred Waterhouse, R.A., the assessor to the Board. These plans were subsequently improved, at the suggestion of the Works Committee, by the adoption of the "échelon" principle of arrangement for all the large pavilions, and this necessitated minor alterations in the general block plan. This is probably the first instance of so large and general an example of arranging pavilion blocks *en échelon*, and now that they are nearly finished, the experiment promises to be both interesting and successful. A reference to the plan now published will show a well-arranged fever hospital capable of accommodating (at present) 518 patients, with capacity for enlargement in the direction of isolation blocks, ambulance station, and other necessary additional buildings in the future. It is intended for cases of scarlet fever, enteric fever, and diphtheria, and for general fever cases accommodated in small isolation wards and blocks for separate treatment. This accommodation is as follows:—

Scarlet fever	8 blocks, each containing 44 beds =	352
Diphtheria	4 " " " 23 beds =	112
Isolation	6 " " containing altogether =	51

Total accommodation of wards	519
------------------------------	-----

There is also accommodation provided for medical superintendent and five assistant medical officers, a matron, and some 200 nurses; a housekeeper and 90 female servants, and the steward, engineer, and 24 male servants, making in all an administrative staff of 324 persons. Advantage was taken of shape of the ground reserved for the nurses' and domestic servants' blocks to subdivide the dormitory accommodation to a very much greater extent than had hitherto obtained, with the result that better classification, with less liability of risks from fire, has been obtained. The location of these blocks has been advisedly kept upon the highest portion of the site, with good gardens, &c., where all may get rest and recreation away from their work. The

whole of the ward pavilions are connected by covered ways (with subways under for mains, &c.) with the administration, laundry, reception, and mess blocks. All the twelve largest pavilion blocks are arranged axially due north and south, and are two stories in height, the ground floors being raised some 5ft. over the level of the airing courts, to secure a circulation of air under all the pavilions. Each scarlet-fever pavilion contains upon each floor a large ward for twenty beds, and one for two beds, together with ward scullery, bath, sink, and w.c. rooms all arranged in such a manner as to avoid any projections from the sides of the pavilions. The diphtheria and enteric blocks are arranged similarly, but with 12 beds in the large wards instead of 20. The heating throughout is by a system of low-pressure hot water, supplemented in the wards by Galton stoves with open fires. As in the case of the Park and Brook Hospitals, the architect in this has introduced many new features of plan and arrangement entirely personal to himself and the works committee. These, however, are too numerous to mention; but the public will await with some interest the opportunity to decide as to which of the three new schemes has best solved the problem of arranging for and erecting such large establishments as these in the most durable and economical manner; not only as to first cost, but having regard chiefly to the cost of maintenance and periodical repair. The structural part of the work is, roughly, about three-fifths of it done, and is being carried out by Messrs. Kirk and Randall, of Woolwich, under the superintendence of Mr. Tiltman, assisted by three clerks of works, the chief of whom is Mr. Thos. Warburton. The collective costs of the various contracts accepted by the Board are, for the structural portions, about £190,000, and for the engineering portions about £33,000—in all, about £223,000.

BEDFORD COURT MANSIONS : BLOCK E.

This building is now being erected on a prominent site, at the corner of Caroline-street and Bedford-avenue, and forms part of the extensive operations comprising the scheme of development for the new street on the south side of Bedford-square. It is the fifth block of the residential flats known as Bedford Court Mansions, and comprises 21 self-contained suites of from five to ten rooms each. The premises are of fireproof construction throughout, with hydraulic lifts to the several floors. The elevation is carried out in red brick, with Portland stone dressings. The circular bay windows are fitted with wrought iron casements. The contractor for this and three of the blocks already erected in Bedford-avenue, is Mr. A. Kellett, of Old Oak Wharf, Willesden; and the architect is Mr. G. D. Martin, 3, Pall Mall East. S.W.

THE "DAILY EXPRESS" BUILDINGS, PAISLEY.

THIS group of buildings is erected at the corner of Causeyside and Forbes-place, and, being treated in Dutch Renaissance, forms a pleasing contrast to the Classic buildings of the above streets. The buildings are erected of cream-coloured Fallahill stone as far as fronting the streets, and the business premises behind are erected of brick. The ground-floor is occupied in connection with the business of the paper, and one separate office. The upper floors of the front buildings are principally used by the Young Men's Christian Association as reading-rooms, recreation-rooms, and committee-rooms. The architect is Mr. C. Davidson, of Terrace-buildings, Paisley.

DETAIL OF THE ATRIUM, PALAZZO MASSIMI, ROME.

THIS vigorous double-page drawing has been made by Mr. J. C. Halden for the *American Architect and Building News*, to which journal we are indebted for its reproduction.

The Streets and Sewage Committee of the Leeds Corporation decided on Friday to accept a contract for about 1,000 tons of coke breeze for the purpose of carrying out at Knostrop Sewage Works Mr. Dibdin's system of sewage purification.

The Consistory Court of London heard on Monday a petition by the vicar and the vicar's churchwarden of St. Mark's, Marylebone-road, for a faculty to confirm certain alterations and additions to the church, including a reredos, a crucifix erected above the pulpit, and pictures of the Stations of the Cross. The people's churchwarden and other parishioners opposed the petition, contending that the services were too Ritualistic, and that the changes which had been made were not necessary. Judgment was reserved.

SOCIETY OF ESTATES CLERKS OF WORKS.—

SOCIETY OF ESTATES CLERKS' OF WORKS.—The members connected with this society selected York last week as the rendezvous of their annual summer outing, arriving at the White Swan Hotel, Goodramgate, on Monday evening, the 16th inst. Those who journeyed to the city included the following clerks of works :—Messrs T. Smith Burgess (Sir Gilbert Greenall, Bart., Warrington), G. W. Crosbie (Earl of Derby), G. Davies (Lord Hotham), G. Heveningham (Duke of Norfolk), E. Hill (Mr. A. Brassey), W. Marshall (Marquess of Salisbury), P. Parry (Lord Londesborough), T. W. Potter (Earl Mansvers), T. Seward (St. Thomas's Hospital), W. Stanhope (Duke of Newcastle), and G. Sutherland (Marquess of Northampton). On the Tuesday the party visited the Minster, City Walls, St. Mary's Abbey, the Museum, &c., and in the evening held their annual meeting at the White Swan. Mr. George Heveningham presided, and Mr. T. W. Potter, the secretary, read the report, which stated that the number of members, with those elected that day, was 98, and the number of honorary members 159. These, compared with previous reports, showed that their numerical strength was fully maintained. With regard to the Shillito memorial tablet, it had been erected in Hatfield Church, and paid for. Mr. Rye, clerk of the works to the Duke of Rutland, and formerly at Duncombe Park, read an interesting *résumé* of the history of Helmsley and Rivaux Abbey. On the Wednesday the party visited Castle Howard, Helmsley, and Rivaux; and the Thursday was spent at Beverley.

The organ which was erected in Peebles West United Presbyterian Church last week was opened on Saturday afternoon. The organ has been built by Mr. J. J. Binns, of the Bramley Organ Works, Leeds.

Plans have been passed for the enlargement of the Blue Boy Inn, Shaw-heath, Stockport, from plans by Mr. Peter Peirce, architect, of the latter town. The estimated outlay is over £2,000.

The parish church of Hopesay was reopened on Wednesday week after restoration from plans by Mr. A. E. Lloyd Oswell, of Shrewsbury. The high-backed pews have been replaced by open seats, a choir vestry has been formed in the belfry tower, the chancel arch has been rebuilt, and choir-stalls provided in chancel. Messrs. Bowdler were the contractors.

The Nelson Wesleyan Circuit's quarterly meeting has passed a resolution to erect two new chapels, each with a holding capacity for about 700 people, to cost £5,000 each, one to be erected at Bradley Hall, the other in Barkerhouse-road. A Sunday school is also to be erected at Barrowford to cost about £2,000.

The annual excursion of the St. Alban's Architectural and Archaeological Society was held on Wednesday in last week, when Bedford and Elstow were visited under the leadership of the Rev. Canon O. W. Davys, one of the hon. secretaries of the society.

Messrs. E. H. Shorland and Brother, of Manchester, have just supplied their patent Manchester grates to the new infirmary, Easthampstead, Berks.

Business at the Mart last week was very quiet, the aggregate realisation, as registered at the Estate Exchange, being only £15,360.

Mr. Charles Wyndham's theatre in Charing Cross-road will be designed by Mr. W. G. E. Sprague, the architect of the Grand, Fulham; the Metropole, Camberwell; and the Shakespeare, Clapham. It will be a two-tier house, and in size will be about as large as its neighbour, the Garrick. It is anticipated that the house will be finished early next autumn.

The dispersal of the historic contents of Hengrave Hall, near Bury St. Edmund's, by Messrs. Hampton and Sons, of London, was concluded at the end of last week. Altogether, there were 1,914 lots, and the selling of these occupied eight days. The grand total realised was £12,635 11s. 10d.

The Strandtown (County Down) police have arrested a builder and contractor named Dugan on a charge of wilfully murdering his son, aged eight years. At an inquest, a verdict of wilful murder has been returned against the father.

The contract for the new premises of the London and Yorkshire Bank at Horley has been let to Messrs. Murgatroyd, builders, of Idle. The work has been commenced, and is being carried out from the designs and under the superintendence of Mr. William Bakewell, F.R.I.B.A., Leeds.

ARCHÆOLOGICAL.

ANTIQUARIAN DISCOVERIES AT GOSFORTH.—The parish church of St. Mary, Gosforth, Cumberland, now undergoing restoration, has proved rich in antiquarian remains. It is not many years since the mythological character of the cross in the churchyard was elucidated. It is believed to be the tallest ancient cross in Britain, and is pronounced "one of the costliest olden roods in Europe." Of red sandstone, elaborately carved with mystic figures in bas-relief, it has withstood the storms of twelve centuries, and is in excellent preservation. The Rev. W. S. Calverley, vicar of Aspatia, made out the carvings on the four sides of the cross to be illustrative of legends in Scandinavian mythology. It is a Christian monument, and not a heathen pillar surmounted by a cross; but it is curious for its representation of Northern myths and Christian doctrines, and for the way in which one bears testimony to the other. One of the sculptures represents the Crucifixion. The remains of three other crosses, apparently of about the same age, have also been found at different times in the churchyard. During the recent alterations, two hog-back or coped tombstones, supposed to be 1,000 years old, have been found. One was under the foundation of the north wall, built probably in 1125. Another was found at the corner of the nave, forming the foundation of the pillar supporting the chancel arch. The one found in the north wall is in two pieces, and is 5ft. 6½ in. long. On one side are carved interlaced ornaments of four patterns, on the other there is a battle scene representing two hostile armies. At the head of one group stands a chief armed with a spear, a circular shield in his right hand; behind him are thirteen warriors, all bearded, and with spears over their shoulders. Opposite stands the chief of the opposing army, holding upright a pole or lance, at the top of which there is a triangular flag, and behind him also there are thirteen men. The second hog-back is in three pieces, and is 5ft. 1 in. long. It has quite a different character. At the apex there is a rope or twist much worn away, and between the rope is the plaited body of a serpent, with the head of a wolf, open-jawed, and like those on Gosforth Cross. It gazes upon and seems to do battle with smaller serpents. In a panel 4ft. long there is a design in bold relief of two wolf-headed serpents in fierce conflict with a human figure, which subjugates or rides upon a smaller serpent, and holds one of its jaws in each hand. Hog-backs, whole or in fragments, exist at Bongate (Appleby), Aspatia, Cross-Canonby, and Millom. They are undoubtedly Scandinavian.

The foundation-stone has been laid of the new R.C. church of the Sacred Heart in the Fort-road, Newhaven. The church is to be Italian in style, of cut flints and red brick dressings, with tower and presbytery adjoining. The buildings have been designed by Mr. W. Romain, of St. Joseph's Home, Blackfriars-road, S.E. For the present it is proposed to build only a portion of the church, with seating accommodation for 100 people.

The Cambria Hotel at Aberystwith has just been opened. It occupies a commanding position at the western end of the Promenade, opposite the pier, and has been erected from the designs of Messrs. Ewen and J. Alfred Harper, architects, of Birmingham. The hotel is built of native stone, in the Renaissance style. When completely finished, the hotel will accommodate a large number of guests. The electric light is installed throughout the building; baths are provided on every floor, with a supply of sea-water under the control of the visitor, and a hydraulic lift gives easy access to the various floors. The entrance hall is decorated in a Pompeian style, and furnished with lounges. A drawing-room, dining-room, coffee-room, billiard-room, smoking-room, and other apartments are provided, as well as suites of private rooms.

Altofts parish church, erected about 18 years ago by the Hon. Mrs. Meynell Ingram, was reopened on Thursday in last week by the Archbishop of York, after complete renovation. About a year ago the roof was repaired, and recently the interior has been redecorated. These alterations and adornments have cost about £700.

The new Theatre Royal, which is being erected in Rolfe-street, Smethwick, will be opened on September 20. The theatre will be capable of accommodating 4,000 persons. The stage is the largest in the district, being 75ft. wide. The building is to be surmounted by three figures symbolic of art, those at the end being 8ft. in height, and the centre one 14ft. The theatre will be lighted with electricity. The builders are Messrs. John Harley and Son, of Smethwick.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.). To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning, to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. All Situation Advertisements must be prepaid.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—B. P. and O. G.—I. M. T.—H. T. S.—A. R.—S. F. O. S.—W. S. S.

Correspondence.

THE ESCALLOP IN ARCHITECTURE.

To the Editor of the BUILDING NEWS.

SIR,—The new Gallery of British Art at Piccadilly certainly presents a very attractive and ornate appearance, and though details may be criticised (as, per example, the lion and unicorn turning their backs upon Britannia, as if they would have no more to do with her), yet its general aspect is decidedly pleasing to the non-professional eye;—specially from a river steamboat is its position on the banks of the Thames seen to advantage.

But there was a small detail I noticed inside which made me wonder whether there was any ancient connection between the scallop shell and London. Resting on each of the numerous brackets which support the ribs of the ceilings is a conventional scallop, very prominently placed.

My question will not, I think, seem so irrelevant when I mention that each of the square purple-covered posts, ranged up the streets from Temple Bar to St. Paul's, was adorned with an escallop and two half-escallops, in gilt, on each side, in the Jubilee decorations.

At the east end of St. Paul's, outside, in the north and south walls, are two niches, having large, well-cut escallops in the roofs, the niches being empty; and the other niches in the cathedral are without escallops. Below the before-mentioned two niches are two very large escallops, the centre of each being pierced by a circular light.

The east end of the modern choir-house, adjoining the Deanery of St. Paul's, is adorned with three very large, admirably-executed

escallops, standing out from the wall in high alto-relievo.

Inside the cathedral, on the base of a marble statue near the south doorway, is carved a small, but well-cut, escallop. And the richly-worked iron and gilt grilles, dividing the sanctuary from the choir aisle, have each twelve niches, containing Prophets and Apostles, each niche having a delicately-wrought escallop in its roof.

Finally, as if the emblem was purposely carried on to the present day, the marble niches surmounting the new reredos (containing the Madonna and Child) has an escallop in its roof.

It seems to me to be utterly impossible to put all this special use of one religious emblem down to mere chance. I, therefore, thought that perhaps some learned reader could explain it. That the escallop was a religious emblem of a remote date is certain; but I will only quote one example:—

"We entered the city Musmeih (in Bashan), the ancient Phœna. The most conspicuous ruin was a temple in a good state of preservation, and the most striking object in the temple was an enormous scallop-shell in the semicircular recess in the back side, opposite the door. . . . From an inscription we got the date of the building, about the middle of the second century A.D. (Wright: "Palmyra and Zenobia," 1895, p. 265). As apparently connected with London's greatest temple, it would be interesting to know what the meaning of that connection is.—I am, &c.,

CARUS.

CHIPS.

Extensive structural alterations are being made at the Art Gallery and Vaudeville Theatre, Newcastle-on-Tyne, from plans by Mr. J. T. Cackatt, of that city. Part of the ground floor of the premises are being reconstructed as a public restaurant, and the theatre is being redecorated and reseated.

At the Newcastle-on-Tyne City Council last week the confirmation of the report of the sanitary committee recommending the extension of the Ouseburn sewer to the river Tyne was adopted. The amount proposed to be expended on the work was £6,000.

The Treasury have promised to contribute a free grant of £20,000 towards the construction of the Forsinard and Portskerra Railway. In the promotion of this line the Duke of Sutherland has taken much interest, contributing the land free, £10,000 of a contribution, and all the sleepers necessary. The construction of the line will now be proceeded with as soon as arrangements can be made.

The annual report of Mr. W. I. Brown, the surveyor for the borough of Northampton, detailing the work done in his department during the 12 months ending March last, states that during 1896 the plans for 319 new houses, seven new factories, two new warehouses, one new workshop, one new free church, eight new stables, and 77 plans for alterations and additions to existing buildings were deposited, approved, and inspected. Forty notices were served respecting dangerous structures, affecting 48 unsafe buildings and properties. Three new streets were taken over by the authorities as public thoroughfares, making a total of 292 streets.

The Bill for the commencement of irrigation works in Cyprus has passed the Legislative Council of that island. It is proposed to spend £60,000 on a test scheme, and, if this is successful, the Government will undertake a general system of irrigation throughout the island.

The Sheffield Corporation are about to introduce the electrical overhead system on all the present tramway routes within the city, and to make extensions to many of the populous suburbs. Since the Corporation took over the tramways there has been a remarkable growth of traffic.

Prof. Fabio Gori, the Royal Inspector of Monuments and Excavations, has discovered in the palace of the Marquis Francesco Canali, at Rieti, three herms in Greek marble, representing Cicero, Sophocles, and Euripides.

The external cement casing on the pseudo-Classical church of All Saints', in the High-street of Southampton, is now being removed preparatory to recentering the unsightly building and carrying out a scheme of repairs and renovations. Messrs. Jenkins and Sons, of Portland-street, Southampton, and Bournemouth, are the contractors.

In commemoration of the Diamond Jubilee, Sir Piers Mostyn, Bart., has decided to provide the village of Gwespyr with a water supply at his own cost. For years past the village, which is situated on an eminence overlooking the Dee estuary, has suffered severely from scarcity of water. The supply is to be obtained from a spring on Sir Piers' land, and the works will include a reservoir of large capacity. The inauguration of the work took place last week.

QUESTIONS.

[11754].—**R.I.B.A. Student's Exam.**—I am a probationer R.I.B.A., and now desire to study for studentship. Would someone recommend me a list of books suitable for study, as I find difficulty in making a selection myself?—W. R. H.

[11755].—**Architect's Drawings.**—In case an architect does not ink-in and colour his drawings, what is the best thing to do in signing up his client and builder? Is to sign the agreements sufficient?—ASSISTANT.

[11756].—**Mastic for Cement Sills.**—Would some reader give the best composition for setting the tongues of oak sills on cement? The cement kills the red lead, and I thought if I used the composition used in setting wood blocks, the temperature might upset same? How is it usual to do this in good work?—J. J.

[11757].—**Asbestos.**—I am obliged to "An Architect" for his reply; but should like to know how the asbestos plastic is used, and whether it is as good for brick as for metal laths. Is not any sand required?—A CONSTANT READER.

[11758].—**Willesden Paper.**—Will someone who has used this inform me whether a roof or a rough shed exposed to the weather can be safely covered with it without slates, and what quality is necessary, what pitch of roof, and how fixed to rafters?—PAPYRUS.

[11759].—**Inlet Valves for Drains.**—I want to know what kind of valve is considered the best, and will last the longest.—T. B.

[11760].—**Dadoes and Wall Linings.**—Is there any cheap decorative material that I can use for a dado? It is not suitable, and plaster is likely to get chipped.—A BUILDER.

[11761].—**Boundary Wall.**—A roadway at the side of a new house has a considerable fall to the main road, and, as I want to build a wall on both sides, I should like to know if it would be best to ramp the wall up in steps, or to build the courses parallel to the roadway. Which would look the best, and how much would the first plan cost relatively to the other? There would be at least four ramps required.—ALEX.

[11762].—**Fleche.**—Can any of your readers inform me whether it would be safe to erect a small wood fleche on the roof of a church (modern)? The roof is high-pitched, well constructed, with principals tied by collars; the walls are substantially and well built. What I want to know is if it would be safe to place the fleche over one of the trusses, and the kind of bracing required. Any example of such framing would be useful. Probably an iron tie-rod would add to the strength. The timbers are sound, and of good dimensions.—A. Z.

[11763].—**American Bowling Alley.**—I want to construct a bowling alley as it is done in America. Will someone kindly give sizes and description, and mode of construction? Also for an ordinary bowling or skittle alley?—EASTON.

REPLIES.

[11714].—**Stone Measurement.**—"Reader" is in error in stating that because four mullions were cut out of block 1ft. 1in. by 1ft. 3in. that mason is not entitled to measure extreme size of each mullion. The rule in measuring masonry is "the smallest square from which the job can be cut." For having mullions cut as he did, mason would have to pay half as much again. Unless mason can save stone, it is useless paying for sawing.—G. G.

[11740].—**Decay of Brick and Stone.**—Look up the volumes of the *Building News*, in which the subject has been treated. For G. Abbott's purpose, I do not think any solution is better than Szerebny's patent solution. All particulars can be obtained from the firm on application, and a paragraph lately appeared in the "B.N."—L. L.

[11740].—**Decay of Brick and Stone.**—One of the best means of arresting decay is to treat the wall with "Fluate," to be obtained of the Bath Stone Firms, Ltd., Bath. The process hardens and waterproofs the surface of stone and brick, and the testimonies to its efficacy as a preserving liquid are convincing. Other processes and remedies are in the market, more or less reliable, for the purpose; but no solution is of any value which does not seal up the pores of the stone and produce a waterproof skin.—G. H. S.

[11740].—**Decay of Brick and Stone.**—"Fluate" is the certain remedy for preserving from decay any building material which is sufficiently porous to absorb the solutions. These are clear and colourless. It is as effectual in arresting the decay of old work as in preserving new work from decay. It also makes the material practically rainproof. Pamphlet and list of references would be sent free on application to the Bath Stone Firms, Ltd., Bath.—H. M.

[11742].—**Local Surveyor—Retaining Plans.**—The refusal to give up plans which have been submitted but not approved is, I believe, usual with some authorities, though on what conceivable ground I cannot say, unless it is to see whether the objections have been removed and the alterations made. Some time ago I read of a similar refusal to give up plans for alteration, the architect who deposited them being told he must make tracings of them at the surveyor's office, which he eventually did. When the plans submitted are contract plans, and the only copies, the architect is put to great inconvenience by their retention. As to the building line, different rules seem to obtain. As "F. C. T." says, the main wall of house is often taken, but when the bays are large the line is taken to the front wall of bays. I do not think there is any general rule in the matter. There is a strong temptation to throw out large bay windows where the front wall of house is made the line. I am afraid "F. C. T." must submit.—G. H. G.

[11743].—**Constants.**—The constants given in Professor Banister Fletcher's textbook on Quantities are

simply multipliers, and one has only to multiply the rate per hour by the constant given. These constants are useful in making approximate estimates, and are based on the principle that a man works so many hours per day. In the last case mentioned the cost of labour per foot super. would be found by multiplying the rate per hour by the decimal given, or would be 11.70, about 11½d. per foot.—X.

[11746].—**Drainage of Street House.**—The best way of preventing the smell complained of is to relay the drain beneath the house, incasing the pipes, which should be cement-jointed, in 6in. of cement concrete all round. The drain should be disconnected from the sewer in front by means of an intercepting trap, and a fresh-air inlet should also be fixed in front, admitting air to the drain on the house side of the intercepting trap. A 4in. outlet ventilating-pipe should also be carried from the other extremity of the drain in a vertical line to a height of at least 3ft. above the adjoining roof, and placed at least 6ft. away from any window or chimney. No trap is required at the foot of soil-pipe; but it would be advisable to provide inspection-chambers for access at each end of drain, in case of a stoppage occurring beneath the house. H. BUSBRIDGE.

[11746].—**Drainage of Street House.**—Cut off the soil-pipe at the foot of the yard before it enters the drain which passes under the house, and insert a disconnecting trap. The soil-pipe should be carried up above roof or eaves, with air outlet. In front, a vertical pipe should be introduced in a convenient position over the drain with a mica inlet valve, so that a current of air will pass through the drain under house and up through the soil-pipe and ventilator. By this means any sewer gas that might escape will be carried through. Of course it is necessary to examine drain-pipes under the house, and see that the joints are sound. The whole drain below house should be covered with concrete.—G.

[11748].—**Deduction of Brickwork for Window Openings.**—In reply to "Young Assistant," he must first take the deduction of the outer four and a-half work up to the inside of frame. Suppose the window between the outside reveals is 4ft. wide and 7ft. high, then the dimension for deduction will be put down thus:

4	0		
7	0		Dedt. ½ brick.

The height is taken from top of sill to springing of arch. The inside deduction is then taken by adding 9in. to the latter width, or 4ft. 9in. by the height, which should be 3in. higher than the former height. The dimension will appear in the book thus:

4	9		
7	3		Dedt. 1½ brick.

These figures suppose the window is for sashes and frames. If the frame is solid only half the addition to the width is made for the internal opening.—A SURVEYOR.

[11749].—**Height of Chancel.**—The chancel should be about the same width as the nave, or very little less, and its length should be about half or a little more. A good proportion of chancel would be about double the length of the space given to the choir. As the chancel contains the altar, it should be at once dignified in size and height, and therefore the most desirable plan is to make it, at least, as high as the nave, the same roof running through. This arrangement is now followed in all modern churches of the best type. By making the chancel narrower and lower than the nave, it loses its importance as the part of the church reserved for the central act of worship, the Sacrament of the Altar, and the appearance internally is sacrificed, as the steps leading to the altar should be at least four (one at entrance to chancel, second at that of the sanctuary, and two within it); a low chancel still further diminishes the height of the eastern end. Generally, instead of four, there are seven—often many more at the altar to give it importance; but these details must be regulated by the size of the church.—G. H. G.

[11752].—**Cement for Marble.**—Perhaps there is nothing better for cementing marble than plaster of Paris mixed with alum-water; but it is important to make the edges thoroughly clean, and the plaster should be rather thin unless the edges are soaked in water. If for coloured marble, the cement must be tinted to suit.—N. E. C.

[11753].—**Floor for Tent.**—Bamboo poles cut suitable lengths and closely strung ladderwise on two or more strong cords would probably answer the purpose. It could be easily rolled up for removal when necessary.—D. W. G.

The proposed lighthouse for Sokotra has been discussed at the Board of Trade by representatives of the various lines of steamships interested and other bodies, and its erection at the eastern end of the island was recommended.

The streets and buildings committee of the Scarborough Corporation have passed plans for the erection, in the grounds of the property locally known as the Castle by the Sea, situated near the old castle, of a revolving tower of the same description as that recently erected at Great Yarmouth. The structure is stationary, but it is surrounded by a platform which ascends vertically at a speed of 30ft. per minute. Two hundred and ten persons can be accommodated on the platform at one time, and the height—120ft.—will carry the spectators to a higher altitude than the Castle-hill plateau, which is 300ft. above the sea-level. The car on the platform, and in which the passengers are accommodated, revolves at the same time that the platform is ascending. The tower will be erected at the highest point in the gardens, and will be constructed of iron in lattice-work form. The platforms, of which there will be 11, will be balanced by weights. The house in the grounds will be transformed into a café and refreshment-rooms.

LEGAL INTELLIGENCE.

FAILURE OF A BOROUGH ENGINEER.—A statement of the affairs of Richard Swarbrick Dugdale, civil engineer and borough engineer to the Huddersfield Corporation, has been issued by Mr. J. A. Binns, the Official Receiver. The gross liabilities are put down at £1,506; the total assets are £100 for furniture, from which £49 has to be deducted for preferential claims, leaving a deficiency of £1,370. The debtor states that his failure has been brought about by the cost of maintaining and educating a large family, interest paid on borrowed money, and expenses connected with his own illness. The Official Receiver further states that the debtor was appointed borough surveyor in 1879, having been deputy surveyor of Salford for two years previously. He owed £300 on coming to Huddersfield. His salary at Huddersfield up to 1890 was £500 a year, and from that date was £600 per year, while during the last 12 years he has received £315 in premiums from articulated pupils. He has a family of seven children, and his expenses in connection with his family have been in excess of his income ever since he came to Huddersfield. The Official Receiver adds that a scheme of arrangement may probably be submitted to the meeting of creditors for consideration.

IN RE JOHN ASHWORTH, OF DAVYHULME.—A meeting of the creditors of Mr. John Ashworth, residing at Mazeena Cottage, Davyhulme, and formerly carrying on business as a land agent and builder at King-street and John Dalton-street, Manchester, was held on Tuesday before Mr. Potter, Deputy Official Receiver. The bankrupt's statement of affairs showed liabilities expected to rank £1,991 3s. 6d., and assets £696 1s. 6d., leaving a deficiency of £1,295 2s. The bankrupt commenced business 12 years ago, with £100 capital, and attributed his failure to depreciation in the value of house property. He attended the meeting, and, being questioned by creditors, stated that he had not kept proper account books, but merely memoranda. Mr. Townley Trotter, accountant, was appointed trustee, with a committee of inspection.

POOR MORTAR.—At Southampton Police-court on Friday, Stephen Goulding, Park-road, Freemantle, builder, was summoned for using mortar which was not of the proper consistency in accordance with the by-laws of the corporation as to new streets and buildings. The town clerk (Mr. G. B. Nalder) prosecuted, and Mr. Page defended. Mr. J. L. Foot, building inspector, in the employ of the Southampton Corporation, said he took samples of mortar from buildings in course of erection at Richmond-road, Freemantle, by defendant. The samples were handed to the borough analyst. In reply to Mr. Page, witness said mortar deteriorated by being kept after mixing. The mortar was not fit for building purposes, owing to the uncleanness of the sand. The borough analyst (Mr. J. A. Brierley) said the sample submitted to him was not mortar as he understood it from experience. The parts of lime and sand were one to five in this case—and it should not be more than one to three. In reply to Mr. Page, witness said the sample produced to him was a mixture of clayey sand and lime, and was not mortar. Mr. Page said the sum and substance of defendant's offence appeared to be that there was a small proportion of clay in the material. Edward Banks, a bricklayer's labourer, in the employ of the defendant, said he mixed the mortar of which the inspector took a sample. He made it two of sand, one of road grit, and one of lime. The defendant was fined £2 and costs, or a month's imprisonment.

SOLICITOR'S AUTHORITY AS AGENT.—Before his Honour Judge Granger, at Helston, on Saturday, Odger Eva, builder and surveyor and borough surveyor of Helston, brought an action remitted from the High Court against A. C. Cuffe Adams, of Bath, for £66 15s., balance of account for work done at Rinsey Farm and Cottages, Breage. Counsel explained that the work was ordered by Charles Frederick Dale, then practising as a solicitor in Helston, the brother-in-law of the defendant, and general agent of the defendant. A specification was forwarded to Mr. Adams, and £130 was agreed to for the work. The total amount of work ordered by Mr. Dale was £249, and the balance now was £66. The plaintiff said he understood Mr. Dale was agent for Mr. Cuffe Adams, the owner of Rinsey. Mr. Dale told him he had sent the specifications to Mr. Cuffe Adams, and he thought it rather stiff. The £140 was, therefore, cut down to £130. He was paid on Mr. Dale's private cheques, but it did not declare on what particular account it was paid on. The whole of the work was carried out, and there were extras. Mr. Dale kept on delaying the settlement, but never complained of the work. Mr. Boase, for defendant.—Until Mr. Dale had left the country you did not make any application to Mr. Cuffe Adams for the money?—Plaintiff: I don't know that he has left the country at all. He has left Helston; and I hear he has left Cornwall. Mr. Boase, for the defence, suggested that Mr. Eva never intended to look to Mr. Adams for payment until he found Mr. Dale

had left the country, but that Mr. Dale was the plaintiff's solicitor, and there was an account between them. Mr. Dale was in no sense a general agent of the defendant. The Judge said it was perfectly clear the defendant had had the misfortune to be let in by Mr. Charles Dale for a very considerable amount, but that had nothing whatever to do with the question he had to decide. The facts were that Mr. Dale suggested this purchase, and was the solicitor employed to carry out the sale. Undoubtedly Mr. Dale was defendant's agent for the management of the property. He was not an agent *quâ* solicitor, but an agent as many solicitors were in Cornwall, having authority to manage the property. In this particular instance he got the contract from the plaintiff for £140, and that was brought to the knowledge of the defendant. Although the extras seemed a large amount, he could not see that when Mr. Eva presumed that Mr. Dale was the agent for the property he had any right to object to do the extras. As regards the question as to whether the contract was properly done, and whether the extras were reasonable, there must be another inquiry, but as to whether there was a sufficient agency, he must decide for the plaintiff. He would leave the other question to be decided by an arbitrator. The parties agreed on Mr. Arthur Carkeek, of Redruth, as arbitrator, and his Honour said he should not decide the question of costs until after the arbitrator's report.

PAVING APPORTIONMENTS.—Mr. D'Eyncourt gave his decision at the North London Police-court, on Wednesday, in a case affecting the owners of property at Springfield, Clapton. The Hackney Vestry had scheduled this road for the purpose of making it up, and had apportioned the estimated cost (about £2,500) amongst the owners of the 33 houses. There were 11 old houses and 22 new ones. The contention of the vestry was that this was a new street within the meaning of the Act, and Mr. Young, who appeared for the defendants, said it was an old and private road, and pointed out that there was a gate and posts at the top. It was further argued for the defence that there was precedent for separating the road in question, and applying the magisterial powers to the new portion only. The leases of the old houses had almost all run out, one having only 2½ years to run, his apportionment reaching £300. —Mr. D'Eyncourt said he had viewed the locality, and considered all the cases submitted to him, as well as some others on the point. He had come to the conclusion that, notwithstanding the gate and posts, it came within the category of a "new street," and the vestry were justified by their action. With regard to separating the road, he thought this also could not be entertained. If it was a very lengthy road, with a quarter of a mile between the houses, it would be unreasonable to call upon the residents to pay for paving the whole; but in this case the houses were fairly continuous, and there was a cross road at either end of the comparatively short road. He gave his decision in favour of the vestry, with £10 costs.

CHIPS.

The partnership hitherto subsisting between R. C. Green and H. T. D. Hedley, of Sunderland, architects and surveyors, under the style of Middlemiss, Green, and Hedley, has been dissolved.

In the ancient village of Newburn-on-Tyne, workmen are at present employed in the carrying out of the sewerage scheme, and pipes are being laid over an area of eight miles of roads, extending to Throckley on the west, and Walbottle on the east. Mr. J. W. Robson, of Newcastle, has been intrusted with the contract; Mr. Gregory is the clerk of works, and Mr. T. Jennings the foreman.

Sydney Coussens, an inspector of works on the South-Eastern Railway, descended a shaft at a new arch being constructed on the line over Queen's-road, Hastings, on Wednesday, and falling off a stage pitched on his head on to a concrete bed below. He was killed almost instantly. Deceased, who was 35 years of age and married, belonged to London.

Her Majesty's Treasury have intimated that they are prepared to make a free grant of the sum of £5,000 towards the construction of the Fraserburgh and St. Combs light railway, under section 5 of the Light Railways Act. It is made a condition of the grant that not less than a like sum be expended by the promoters on works, exclusive of the value of land to be granted by landowners. The cost of construction, exclusive of land, is estimated at £12,000.

On Wednesday week a new organ, presented to Berkswell Church by Mr. J. Feeny, was dedicated by the Bishop of Worcester. The organ has been erected by Messrs. Willis and Sons, of Camden Town, London. It occupies a portion of the space beneath the tower at the west end of the quaint old church. It is inclosed in an oak case, and the front pipes are of polished zinc. The organ consists of two manuals, namely, great and swell organs from double C to G.

Our Office Table.

MR. F. C. PENROSE, F.R.S., writes, in Saturday's *Times*:—"In your edition of the 14th inst. a correspondent from Athens gave a very alarmist account of the Parthenon. That the Parthenon urgently requires some considerable repairs I quite agree. The examination of the temple with a view to these repairs was the object of an express journey which it was my duty to make, having been invited by the Greek Government, in concert with two other architects—a Frenchman and a German—for the purpose of advising them on this very point; and in the spring of last year I was engaged at Athens for about a month on that duty. If, as I trust, the Greek Archaeological Society—notwithstanding the recent, and, I fear I must add, the still continuing, calamities of the country—are able to complete the repairs which they had undertaken to carry out, I believe the future conservation of the building may confidently be left to a future generation."

The twenty-seventh autumn exhibition at the Walker Art Gallery, Liverpool, which opens on Monday next, promises to be an unusually attractive one, and will include several of the most prominent pictures shown at the Royal Academy this season. Military subjects are strongly represented, and quite a number of large canvases depicting stirring incidents on the battlefield are to be found on the walls. Chief among these is the famous picture, "The Roll Call," by Lady Butler, which has been lent by the Queen. This work, painted so far back as 1874, has been assigned the place of honour in the Grosvenor Room. Occupying a prominent place in the same room is the recently-painted portrait of Earl Derby, by Mr. W. Q. Orchardson, R.A. From the Academy exhibition have also been secured the portrait of Mrs. Meyer and her daughters, by Mr. John S. Sargent, and "Pilehards," by Mr. C. Napier Hemy. Sir E. J. Poynter is represented by a small work; Sir E. Burne-Jones by the "Depths of the Sea"; Mr. G. H. Boughton by the "Vision at the Well," which is one of the principal pictures in the Grosvenor Room; Mr. David Murray, A.R.A., by "Hamstead Heath"; and Mr. Colin Hunter, A.R.A., by a fine Scotch scene. Other prominent works are by Messrs. Luke Fildes, J. McAlister, J. W. Waterhouse, A. Hacker, J. Lavery, Walter Langley, and Byam Shaw.

The fourth annual exhibition of the Society of Scottish Artists was opened at the R.S.A. galleries in Edinburgh on Saturday, and comprises 387 oil pictures, water-colours, and pastels, and but eleven pieces of sculpture. The loan works include "Don Quixote" by Corot, Gaston la Touche's "Return to the Port," a sunset scene by Cecil Lawson, and Raeburn's portrait of Mrs. Janet Sempill. Among the works by members are the portrait of the Marquis of Huntly, president of the society, by Mr. Coutts Mitchie, landscapes by Marshall Brown, Joseph Farquharson, R. Noble, and Mason Hunter; seascapes by J. Campbell Noble, and R. Burns, and portraits by Martin Hardie, W. S. MacGedge, and John Bowie.

By the Poor Law Act, 1897, an omnibus measure carried through by the Local Government Board, and which received the Royal assent on the last day of the late Session, the power of the Metropolitan Asylums Board as to borrowing money for land and buildings under the Act of 1867 are extended to "any land or buildings which may in the opinion of the Local Government Board be required for the purposes of the Act." The Asylums Board can now, therefore, buy a site, and build central administrative offices—a power they did not previously possess. Immediately on the passing of the Act the Local Government Board forwarded to the Asylums Board their formal sanction of the purchase from the City Corporation of the site on the Thames Embankment at the corner of John Carpenter-street. The land was sold by the City Lands Committee of the Corporation, subject to the necessary Parliamentary powers and the consent of the Local Government Board being secured. Both conditions having now been fulfilled, the purchase will forthwith be completed in accordance with the agreement. The land is about a third of an acre in extent, having a frontage of 93ft. to the Embankment. The price is £53,000, and the estimated cost of the buildings to be erected £30,000.

The members of the English Arboricultural Society, who held last week their annual session in Lynn, closed it on Friday evening after a most successful meeting. The society was founded at Hexham in 1880 with about a half-dozen subscribers. The number has yearly increased, and it has now upon its roll something like 420, with headquarters at Haydon Bridge, Northumberland. Its object is to promote the cultivation of trees and shrubs. Mr. F. W. Beadon is president, and Mr. John Davidson secretary and treasurer. On Wednesday in last week a journey was made to Rising Castle Hall, the seat of Sir Horace Farquhar, M.P., and thence to the Sandringham estate of the Prince of Wales, who provided the party with luncheon in the club-room at Wolferton. Upon leaving Sandringham a drive was taken to Houghton, the property of the Marquis of Cholmondeley, where the party was interested in the magnificent avenues of beeches and in several remarkably fine specimens of cedars of Lebanon. Lord de Grey and Wilton provided tea for them. The annual dinner was held at night at the Globe Hotel, Lynn, the president occupying the chair, and amongst his supporters was the ex-mayor of the borough, Mr. E. Dunn, who cordially welcomed the members of the society to the town. On Thursday, the excursionists went to Holkham-park by the kindness of the Earl of Leicester, K.G., Lord Lieutenant of Norfolk. The last day of the session (Friday)—another showery day—was devoted to Melton Constable, the seat of Lord Hastings. Several places have been suggested for next year's meeting, and Balmoral appears to be the most favoured.

The attendance of members and associates at the meeting of the British Association does not appear to have been so great as was expected; but there was quite a large representation of American men of science, and they contributed several valuable papers. The attendance on the opening day is given by the secretaries at 1,200. Prof. Roberts-Austen's discourse on the metals of Canada naturally attracted a very large audience, and his experiments with the electric furnaces were highly appreciated. Much time has been spent in excursions. The sums to be granted for various reports and researches amount to £1,200. The members of the Mechanical Section, besides many others, paid a visit to Niagara, some to inspect the power-stations there, some as geologists under the guidance of Dr. Gilbert, of the U.S. Survey, who probably knows every inch of the district around the Falls, the Rapids, and the Gorge.

The will of the late Mr. C. J. Phipps, F.S.A., of 26, Mecklenburgh-square, W.C., who died in July last, was proved by the executors, Mr. R. Eugene Sharp, and his wife, Mrs. Honnor Phipps, on Aug. 14. By his will Mr. Phipps leaves the whole of his property to his wife for life, and in the event of her remarriage or decease, to his four children; and in the event of the decease of any of them, then such portion as would come to their individual share to go to their children, if any. The value of the personality is sworn at \$8,858 net.

The wills have just been proved of the brothers Sir William Lawrence and Sir James Clarke Lawrence, formerly of the firm of William Lawrence and Sons, builders, of Pitfield-street, Hoxton, and Lambeth, who both served the City as alderman, sheriff, and Lord Mayor, and were for many years members of Parliament, and who died last spring at advanced ages within five weeks of one another. Sir William Lawrence left personal estate of the net or actual value of £117,113 12s. 10d., and his younger brother, Sir James Clarke Lawrence, left personal estate of the gross value of £152,098 2s. 11d. and of the net value of £30,389 15s. 1d. In both cases, the surviving brother, Mr. Edwin Lawrence, M.P., is appointed residuary legatee.

At an adjourned special meeting of the Belfast Corporation on Wednesday week, the question of additional asylum accommodation was again under discussion. The Board of Control of Irish Lunatic Asylums urge that a building should at once be erected at Purdysburn for 360 chronic patients, at an estimated cost of £60,000. The resolution originally submitted on the subject was withdrawn in favour of a resolution, which was unanimously adopted, to the effect that the Board of Control be informed that before any other steps are taken in the matter of the erection of the proposed asylum accommodation at Purdysburn, the Council was of opinion that quantities

should be taken out and tenders obtained for the alternative proposals of a complete asylum, as proposed by their architect, and the section now proposed to be erected, in order that the Board of Control and the Council might be in a position to determine which it would be more desirable and economical to proceed with.

THE International Mathematical Congress, which closed at Zurich last week, decided that the next congress should be held in Paris in 1900. It was also resolved to appoint an international commission of five members, who are to report on mathematical progress and literature in their respective centres, and to promote the establishment of mathematical departments in university and other libraries. Resolutions were also passed in favour of the adoption of a simpler terminology and the institution of a central correspondence bureau, in order to maintain closer relations between teachers and students of the higher mathematics in different countries.

A NEWLY-DISCOVERED process for treating marble or other similar stones in order to give them any coloured shade, veins, or spots, says the *Chicago Tribune*, consists in leaving these stones in one or more baths composed of a solution of alcohol and one or more colours of aniline or other colouring materials. The colouring materials are fixed by leaving the coloured stones in a bath of oil or any other fat substance, or by applying upon the stones layers of the same stuff. The absorption of the organic colouring materials and of the fat substances by the stone may be accelerated by heating or boiling the bath which contains the stuff to be treated.

AMONGST the grants made for the U.S. Geological Survey are, for topographical surveys, 175,000dol.; for geological surveys and researches, 100,000dol.; for investigation of coal and gold in Alaska, 5,000dol.; paleontology, 10,000dol.; chemistry, 7,000dol.; gauging streams and water-supply, 50,000dol.; mineral resources, 20,000dol. These amounts are exclusive of any expenses of printing, &c.

THE students attending Professor Gourlay's Architecture and Building Construction Classes at the Glasgow and West of Scotland Technical College have been very successful in this year's examinations. All the students presented in architecture and architectural design passed, two of them taking an excellent, five a first class, and five a second-class certificate. In honours building construction, four students were admitted to the practical examination in design, held in London, and all passed, James M. Alexander, John M. Arthur, and James S. Boyd taking first classes with bronze medals, while John Smith passed second class. In advanced building construction, 66 students were presented, of whom 18 passed first class and 47 second class; while in the elementary stage 71 were presented, and none failed; 64 take "pass," and seven "fair." In masonry, Archibald Scott took second place in the United Kingdom in the ordinary grade, thereby obtaining the bronze medal of the City and Guilds of London Institute with £1. One other student took a first class in this grade, and two a second class. In the honours grade of masonry three students passed. In carpentry and joinery ten students took first classes, and five second classes in the ordinary grade. In the National competition, the awards for architectural designs executed entirely in the classrooms, and for measured drawings of old work executed under the superintendence of the professor and his assistants, were the highest yet received by students of this college. They consist of one silver medal, which was won by James M'Kissack; two bronze medals to James Mather and Wm. S. Moyes; two national book prizes to Wm. S. Moyes and Joseph E. Potts; and two prizes for sets of works awarded to Wm. McClelland and Gordon L. Wright.

Marble deposits are known to exist in several districts in New South Wales, but they have not received the attention their importance deserves. Fine samples of red-brown to almost black can be obtained near Bathurst, and a beautiful grey from near Mudgee. A nicely-marked brown is obtainable in the neighbourhood of Molong, and a pure white from near Newbridge, said to be equal to the second-class marble from the famous Carrara quarries. A deposit near Rylstone is of a black colour, with white streaks and gold markings. Immense deposits of green serpentine also exist in the vicinity of Lucknow, N.S.W., which are well worth attention.

Trade News.

WAGES MOVEMENTS.

DUNFERMLINE.—A strike of Dunfermline joiners began on Monday. A meeting was held in the forenoon, at which it was reported that two employers—one of them having the largest carpenter business in the city—had granted the advance of a penny per hour asked. It was unanimously resolved that those who had not received the advance should remain idle.

EDINBURGH AND LEITH.—The men engaged in the building trade at Edinburgh and Leith, who came out on strike three weeks ago for a reduction of hours, returned to work on Monday, the masters having conceded an eight-hour day. The Edinburgh master lathers have also agreed to increase the wages of their men from 8½d. to 9d. per hour, commencing on September 6.

LURGAN.—The members of the Amalgamated Society of Joiners of this town have applied to the masters for an increase of 4s. per week. The employers offered an increase of 2s. 6d. per week, with a promise that they would give a further increase of 1s. 6d. next spring if work was any way good. The men refused to accept these terms, and came out on strike.

MIDLAND BRICKMAKERS' WAGES SETTLEMENT.—A settlement of the Oldbury brickmakers' strike was arrived at on Monday at a conference between the employers and representatives of the men. The result of the scale of wages drawn up and agreed upon by both parties is to grant some of the men a small increase, whilst others are to work at the old rates, and in some instances the men complain that they have actually suffered a reduction under the new tariff. The female workers are pleased with the arrangement, as the basis agreed upon, so far as they are concerned, is much more satisfactory than their old system, and their wages will be increased, in some cases considerably. The union officials consider the matter closed by the agreement signed by both parties, and if any of the men choose to continue the strike they will do so on their own responsibility.

PENRHYN QUARRY DISPUTE.—The terms of settlement of the Penrhyn Quarry dispute, which had been signed by Mr. Young, on behalf of Lord Penrhyn, and by Messrs. W. H. Williams, Robert Davies, and Henry Jones, "on behalf of the men for their confirmation," were laid before a mass meeting of the Bethesda quarrymen on Saturday night, and, after a long discussion, accepted *en bloc*. The terms of settlement provide:—1. That, in the first instance, grievances shall be submitted by the person or persons to the local manager. If not satisfied with his decision, the grievance may be submitted to the chief manager, either personally or by deputation appointed in such manner as the workmen may deem advisable. If the men are dissatisfied with the result of submitting their grievances under the preceding clause, they are now empowered to submit them again to the chief manager by a deputation consisting of six *employees* selected from the whole body of the workmen, and not from the classes or crews particularly aggrieved as under the first clause; and in all cases of importance an appeal may be made to Lord Penrhyn, either by individuals or by deputation. 2. Monthly bargains are to be given to suitable Rybelwya without delay. 3. The letting of contracts is to be left in the hands of the management, who are to engage all persons employed thereon, and to see that each receives his just rate of wages. Quarrymen are to be paid an average wage of 5s. 6d. per day, "bad rock men" 4s. 7d. per day, and labourers 3s. 7d. per day, as long as trade permits. 4. All the late *employees* are to be readmitted in a body as far as practicable, and the remainder as work can be arranged for them, time being allowed for those now working at a distance. The management have refused to grant the payment of wages fortnightly, as desired by the men.—About 2,400 late *employees* made individual application for employment on Wednesday, and it is anticipated that bargain letting will start next week.

THE AMALGAMATED SOCIETY OF CARPENTERS AND THE ENGINEERS' STRIKE.—The members of the 780 branches of the Amalgamated Society of Carpenters and Joiners are being asked to vote on the question whether they will levy themselves 3d. per week in support of the engineers and allied trades now seeking to establish the eight hours working day, and continue the same until a settlement in London is effected? If two-thirds of the branches adopt it, the levy will be commenced at once. The Sheffield and other branches have already replied in the affirmative, and it is believed the great majority, if not all, of the branches are in favour of supporting the engineers.

Additions are being made to the lunatic asylum at Omagh at a cost of about £5,000. Mr. Joseph Colhoun, of Londonderry, is the contractor.

CHIPS.

Mr. H. H. Law, one of the Local Government Board's inspectors, held an inquiry at the board schools at Alverthorpe, near Wakefield, on Friday, with reference to an application made by the Wakefield Rural District Council for sanction to borrow £4,000 for extending and improving the sewage works at Alverthorpe, and for £1,100 for works of surface-water drainage. Mr. Massie, engineer to the rural council, explained the proposals, which were opposed by the corporation of Wakefield.

The Light Railway Commissioners have intimated that they will recommend the Board of Trade to make an order authorising the construction of a light railway from Peakirk, in Northamptonshire, via Crowland, to Postland, in Lincolnshire. The length of the proposed line is eight miles, and is intended for the benefit of the Crowland district, which has no railway within nearly four miles. The promoters hope to have the line constructed within twelve months, the necessary capital having been obtained. The new line will form a junction at Peakirk with the Great Northern Railway, on the Spalding and Peterborough line, and at March with the Great Eastern Railway on the Spalding and March line.

The Rev. G. E. Aspinall, chairman of the Halifax Board of Guardians, will perform the ceremony of laying the foundation stone of the new workhouse infirmary, at Skircoat, in about six weeks. The stone will consist of a huge granite block, suitably inscribed. The cost of the infirmary is estimated at £130,000.

A new infants' school which has been erected at Hasbury, near Hales Owen, was opened by Viscount Cobham on Monday. The school, which contains a large room, two classrooms, and a cloakroom, is capable of accommodating about 260 children. It has been erected at a cost of £1,000, all of which has been subscribed. Messrs. Roberts and Sons, of Cradley, were the builders, and Mr. Meredith was the architect.

Mr. G. W. Willocks, Local Government Board inspector, held an inquiry on Tuesday week, at the Dovey Valley Hotel, Cemmaes-road, Machynlleth, into an application by the Machynlleth Rural District Council for sanction to borrow £500 for the erection of a bridge over the river Dovey at Cemmaes-road, and also for the construction of new roads and approaches leading thereto. Mr. D. Evans, the clerk to the council, explained that the total cost of the proposed bridge would be £1,281 8s., of which the county council would provide £592 10s. The necessity for a bridge had been long felt, there being only two bridges for carriages in the district. There was a distance of about nine miles between the two bridges, and the proposed new bridge would be situated about midway between them. Evidence was also given by Mr. G. A. Hutchins, county surveyor, and Mr. R. Williams, surveyor to the rural district council.

Alderman Holden, of Walsall, who last year started a permanent town's collection of pictures with the gift of a Welsh landscape, has just acquired "The Bride of Lammermoor," by H. Gillard Glendone, for presentation to the same borough. It depicts the meeting of Lucy Ashton and the Master of Ravenswood as described in the opening lines of Chapter xxxii. of Sir Walter Scott's novel. It was exhibited in the Royal Academy in 1885, the year in which it was painted.

In view of the development of the Chat Moss estate, which was purchased by the sanitary department of the Manchester Corporation more than a year ago, a wharf is being constructed on the banks of the Ship Canal at Hulme's Bridge. The corporation purpose utilising the old bed of the river Irwell between Hulme's Bridge and Lower Irlam for the purposes of a canal lay-by.

The town clerk of Manchester presented a report to the rivers committee on Monday on the position of the corporation with reference to the disposal of sewage. The committee resolved to defer discussion on the subject for a few days, the city surveyor in the mean time to report as to the best possible point near Randle's sluices at which to place the effluent outfall, so that opposition on the part of the Mersey and Irwell Joint Committee may be avoided.

Mr. George William Tomlinson, J.P., of Huddersfield, who died on Saturday at the age of 60, had for more than 21 years been the hon. secretary of the Yorkshire Topographical and Archeological Society, and had also held many public offices in the town.

The Ramsgate Corporation intend to make application to borrow £20,500 for gaswork purposes.

Mr. John Belcher, F.R.I.B.A., of Hanover-square, London, has been appointed by the town council of Cambridge to prepare a design for new buildings for the front of the Guildhall. Application is to be made to the Local Government Board for power to borrow £5,000 and costs, in addition to such other sum as may be found necessary for the erection of the new buildings.

CHIPS.

The town council of Llanelly intend to carry out the reconstruction of the sea embankment at a cost of £3,818.

The death is announced from Paris at the age of 85 of the well-known painter, M. Lecoq de Boisbaudran, of late years the director of the Ecole de Dessin des Arts Decoratifs.

The new Roman Catholic Church of St. Mary's-on-the-Hill, Carnmoney, the erection of which has just been completed, was on Sunday solemnly dedicated by the Most Rev. Dr. Henry, Bishop of Down and Connor. The building has cost £3,000.

The Chancellor of the Diocese of London has ordered the removal of an organ which had been placed by the churchwardens in the south transept of Ashford parish church, Middlesex, on the ground that it had been erected without a faculty having been previously obtained. It was stated that the organ would conceal a memorial window and deprive the parishioners of forty sittings.

Probate of the will of Mr. Richard Christopher Rapier, of Brinkburn, Upper Tooting, and of Ransomes and Rapier, Limited, 32, Victoria-street, and Waterside Works, Ipswich, engineer, who died at The Lees, Folkestone, on the 25th May last, aged 60 years, leaving personal estate of the value of £62,989 3s. 9d. has been granted.

Mr. J. W. Willis-Bund, chairman of the Worcestershire County Council, held an inquiry on Friday at the workhouse, Selly Oak, into an application of the Northfield Parish Council for consent to purchase a piece of land on the Wooley Park estate, Selly Oak, for the purposes of a recreation ground for Selly Oak and Bournbrook, and also to borrow a loan of £3,200 for the purchase of the land and works connected with it.

Lord Middleton, the Lord Lieutenant of Surrey, has received an intimation from an anonymous donor to the fund for establishing a convalescent home for women of the county in commemoration of the Queen's reign, that he is prepared to build the institution at his own cost, provided that an annual income of £800 is assured. Mr. Maurice Beddington gave a site for the home near Ramsgate a short time ago, consisting of four acres, of the value of £4,000. The fund now exceeds £9,000.

At the last meeting of the Northwich Urban Council instructions given to Mr. Bancroft for the sinking of trial holes, &c., preparatory to submitting a comprehensive scheme for the sewerage of the district, were confirmed. A scheme, estimated to cost £37,000, has been under consideration. This was for one part of the town only, and as complaints have been frequently made that the lower parts of the district have been flooded owing to the sewerage arrangements, it is expected that a scheme embracing practically the whole of the urban district will be adopted. The council decided to engage Mr. J. Cawley, surveyor, to supervise the making of a number of private streets, his remuneration to be 2½ per cent. on the total outlay.

The Opera House at Londonderry has been re-decorated by Messrs. J. Shaw and Co., of Belfast, the works to the ceiling, proscenium, and front of boxes being carried out by Mr. James E. Reid, of London.

The new line from Wootton Bassett to Patchway, known as the South Wales and Bristol Direct Railway, is about to be commenced. This will be 32 miles in length, and will shorten the distance between South Wales and London by 22 miles, and between Bristol and London by two miles. The contract has been let by the directors of the Great Western Railway Co. to Sir W. Pearson and Co., of London, and the work has to be completed within three years. One effect of this railway will be to open up districts in Gloucestershire which have hitherto been unprovided with railway accommodation.

The plans of the scheme of Messrs. Stevenson and Burstall, of London, for the reconstruction of the sewerage system of Douglas, Isle of Man, at a cost approaching £50,000, have now been fully approved of by the town council of that watering-place.

The master builders of Aberdeen left that city on Friday on their annual excursion, the Trossachs and Loch Lomond being the places selected as the scene of the outing. The party, to the number of 20, travelled in a special saloon attached to the 5.25 Caledonian train. Staying overnight in Stirling, they started on Saturday morning on their trip through the beautiful country between Perthshire and Dumbartonshire. The return journey was made by Balloch and Glasgow, Aberdeen being reached at 10.5 the same evening.

Colonel W. Langton Coke has held an inquiry in reference to an application by the East Ham Urban District Council to borrow £1,400 for the purchase of land for the purposes of sewage disposal, and £1,050 for the fire brigade purposes and for the construction of an underground sanitary convenience.

The partnership hitherto subsisting between E. E. Homer and W. H. Ridler, architects, of Bucklersbury, E.C., under the style of Homer and Ridler, has been dissolved.

The subject of a proposed subway under the Strand from the Temple to the Law Courts has been again submitted to the Strand Board of Works by the Temple authorities. The Works Committee of the Strand Board have issued a report recommending that the application be granted upon condition that the subway be open only during such hours as may be necessary to accommodate the business of the Royal Courts of Justice, and that the public have the right to use it at such times as it may be open. The subject will be fully considered at the meeting of the Board after the vacation.

Colonel Albert J. Hepper, R.E., held a Local Government Board inquiry at Nuneaton, on Friday, respecting the application of the Nuneaton and Chilvers Coton Urban District Council for sanction to borrow £1,500 for the erection of a public library.

The new organ in Bangor Cathedral is fast approaching completion, and will be opened next month.

Lady Augusta Mostyn opened a bazaar at Deganwy, Llandudno, on Friday, and announced her intention of erecting a new church at an outlay of £2,000 on a site given by her son, Lord Mostyn.

A peal of eight bells has just been placed in the tower, added in 1887, to St. Michael's Church, East Teignmouth. The bells have been cast by Messrs. Llewellyn and James, Bristol, and Mr. Harry Stokes, of Woodbury, Devon, has hung them. A new oak floor, frame, and fittings have been furnished. A set of eight chimes has been added to the clock by Messrs. John Smith and Sons, of Derby, who made the clock in 1889. The dedication service took place last week.

A strike of masons and bricklayers has broken out at Buda-Pesth, as their demand for higher wages has been refused. Some ten thousand have struck, and about an equal number of assistant workers are thrown out. There have already been several conflicts between the strikers and the police.

The Right Rev. C. O. L. Riley, D.D., Bishop of Perth, West Australia, conducted a dedication service at the parish church, Morecambe, on Friday, when the new chancel, organ chamber, and vestries were formally consecrated, and the new east window was unveiled. The east end of the church has been entirely rebuilt. The cost of the alterations has been £1,105.

A branch of Messrs. Barclay and Co.'s bank was opened for business on Monday, at the corner of Market-street and Grainger-street, Newcastle. The premises, which were recently destroyed by fire, have been reconstructed from plans by Mr. J. C. Cackett, F.R.I.B.A., of Newcastle. All the bank fittings are of Spanish mahogany, teak being employed for the external woodwork. This rests upon a base and sur-base of red and grey granite. Messrs. Sopwith, of Northumberland-street, Newcastle, carried out the teak and mahogany work for the architect, and Messrs. Emley did the granite work, while the structural work was executed by Mr. Maughan, of Westgate-road, in the same city.

The formal opening of the new premises of the St. George's Co-operative Society at the junction of George's-road and Gladstone-street, Glasgow, took place on Saturday. A cost of something like £25,000 has been incurred in acquiring and altering the large block of buildings to suit the wants of the society.

A receiving order has been granted in the case of Edward Vigers, Elgin-avenue, Notting-hill, W., and Palace-chambers, Bridge-street, Westminster, S.W., late Parliament-street, S.W., architect and surveyor.

The Roman Catholic bishop of Southwark laid the foundation-stone of a Catholic Church at Redhill on Tuesday afternoon. It is to take the place of the old church, which had become much dilapidated.

Mr. E. Onslow Ford, A.R.A., has been commissioned to execute a statue of the Duke of Norfolk, in commemoration of his public services whilst Mayor of Sheffield.

The offer made a little time back by the David Lewis Trustees to purchase Rupert-lane Barracks, Liverpool, has now been accepted by the authorities. As soon as arrangements have been made to complete the purchase, and the land is transferred to the Lewis Trust, steps will be taken by the trustees to have the unsightly old barracks pulled down, and the site laid out as a public recreation ground and a pleasure garden.

The Board of Trade has granted a license for three years from the present month for the working of the Highgate Hill Steep-Grade Cable Tramway. The cars, after remaining idle for four years, were re-started a few months ago, the tramway, after being repaired, being worked under a provisional license from the Board of Trade.

At a special meeting of Dundee Town Council on Monday a resolution in favour of the municipalisation of the tramways was carried by a large majority.

The school board for Halifax adopted on Monday plans by Mr. J. F. Walsh, of that town, for extensive additions to their school in Ackroyd-place.

Excavations that are being carried out near the Casino, at Baden-by-Zurich, have brought to light many relics of the time when this district was the great *entrepôt* of the Roman army in Transalpine Switzerland. The site of an old Roman military hospital has been found. A still more valuable "find" has been made in the shape of a villa, which must have belonged to some wealthy Roman. A well-modelled statuette in bronze, representing a faun, and a three-branch candlestick are among the objects discovered.

FRIDAY, SEPTEMBER 3, 1897.

DIRECTORS OR BUILDERS.

MEN who can organise and direct are now the successful men of business, and for a man to succeed in any vocation in these days it is no longer necessary that he should perform his own work, or to be a skilled expert. With one or two exceptions, the proposition holds true. The surgeon indeed must be an expert operator; the painter and sculptor has each to execute his own ideas in canvas or marble; but, notwithstanding these and a few other exceptions, the leading professional man is he who can direct and control others—the “whip-hand,” to use an expression suitable to another occupation. So true is it, that we hear in every profession the complaint that the superficial and the incompetent get on, while the man who has come out of his school with flying colours or won academical honours finds it hard to get employment.

In these days, the man of action and the business man, one who can transact affairs with as little friction as possible and does not allow art to absorb too much attention, is he who succeeds. As far as qualifications go, readiness in facts and figures is of more consequence than learned research into the theories and principles of architecture, or even a facile pencil, much as the latter is valuable as an auxiliary of practical qualities. Mr. Bookful has never been able to supplant Mr. Pushington in the practical qualities of winning clients, managing committees, or arranging contracts, and we are afraid it must be confessed that the purely practical man wages an unequal conflict with the mere artist draughtsman. For some reason or other in the nature of things, the gifts of imagination and art expression have very seldom found a congenial soil in the mental discipline and habits of the student. Those experienced in architectural class teaching, and in schools of art, have to confess to finding a certain dislike to sustained study amongst artists and draughtsmen. They are bad readers, and worse thinkers. The exceptions make the rule. To set an architectural student on a problem of mathematics, or to give him the task of finding the strains in a girder or roof, is to expect him to do something of the most uncongenial kind. His soul revolts against figures. For analytical study the artist has little inclination. Art-designing is synthetic: it puts together, combines, and arranges;—on the contrary, scientific and mathematical studies require the very opposite process. The student has to analyse, take to pieces, and dissect, and form his conclusions. From data and experiment he has to discover certain laws and apply these step by step. Thus, in working out a formula for a girder or a roof, he has to determine certain loads, how they act, what strains they produce, and then to find certain sections or positions of members which will give the required strength. The process is absolutely the reverse of the way an architect would sketch out a structure. Suppose it is a vaulted building of masonry. He lays down his plan and sketches his elevation for the whole building before he thinks of proportioning his section or the size of his buttresses. The designer does not think of drawing a diagram of forces for his section, or showing where the resultant of the thrust of his vault and the weight of his masonry will come, till he has satisfied himself of the proportions of his building and its elevation externally.

Men of the Pushington stamp are equally

averse to artistic studies. The bustling business man has no time nor inclination to ponder over nice proportions, delicate mouldings, or subtleties of form and colour, and if he can delegate all this kind of work to another—a “ghost” or a decorative artist—he is quite satisfied. To him “time is money,” and the quicker he can turn out one job after another the better. Owing to these ineptitudes of the student and the business man, it comes to pass that their labours have to be pursued on different lines to those of the designer. They can be learned from books or cultivated in the office or committee-room. Not so the designer; he can only cultivate his art in the studio. But the business fact is an art also. The clever man of business is an artist of management; he knows how to organise and direct—a valuable qualification which should not be forgotten by the younger men in the profession who scoff at office work and management. The most successful men in the profession have been those who have brought to their genius as designers the discipline of business habits. It was by their dual qualifications as directors and designers that men like the late Sir Gilbert Scott and Mr. Street accomplished the prodigious amount of work that fell to their share—an amount unequalled by any architect of the Middle Ages. But how? Neither of them could have done so single-handed: they had their surveyors, quantity-takers, draughtsmen, clerks of works, and a staff of assistants; it was impossible for either of them to superintend all their works scattered up and down the country, or even to give them more than a hasty inspection. Modern facilities of education, railways, and other opportunities have made it practicable to bring together these various agents, under leaders of the profession, so that a successful architect can muster at his command an army of workers, and by dividing his forces undertake to carry out a score or more of big buildings, the designs for which have all been prepared at his London offices. This centralisation of skill and labour is very different to the system under which the great edifices of the Middle Ages were constructed.

Let us take the testimony of an authoritative writer. In his article “Construction,” in the “Dictionnaire Raisonné de l'Architecture Française,” Viollet-le-Duc describes the duties of the architect in the West: “It was incumbent upon the constructor to procure the materials, to find the means of transporting them, and to contend against the ignorance of unskilful labourers, and that he himself should make his own observations as to the quality of the lime, of the sand, of the stone, and to look after the storing of the timber. He not only had to be the architect, but the quarryman, the surveyor, the modeller, the superintendent, the carpenter, the lime-burner, the mason, and could be assisted only by his own intelligence and reason as an observer. To-day, when a lawyer or a business man has a house built without the assistance of an architect, it is easy for us to consider these first efforts as rude; but the genius which a builder of that period required and evinced in the erection of a hall, or a church, was certainly superior to that demanded from an architect of our time, whose operations may be carried on without any knowledge of the first elements of his art, a thing which too often occurs. . . . In those days of barbaric ignorance, the most intelligent—those who had raised themselves by their own genius above the common workman—were alone capable of directing a structure, and the superintendence of buildings, necessarily limited among a restricted number of superior men, for that reason produced original works, in the execution of which the reasoning faculties were largely called upon where calculation is apparent, and the form bears that stamp of superiority which is the distinguishing
